for this purpose, and even urinate in bed or in her clothes to obtain the desired sexual relief.[54] I am acquainted with a lady who had a similar, but less intense, experience during childhood. Sometimes, especially in children, the act of urination becomes an act of gratification at the climax of sexual pleasure, the imitative symbol of detumescence. Thus Schultze-Malkowsky describes a little girl of 7 who would bribe her girl companions with little presents to play the part of horses on all fours while she would ride on their necks with naked thighs in order to obtain the pleasurable sensation of close contact. With one special friend she would ride facing backward, and leaning forward to embrace her body impulsively, and at the same time pressing the neck closely between her thighs, would urinate.[55] Féré has recorded the interesting case of a man who, having all his life after puberty been subject to monthly attacks of sexual excitement, after the age of 45 completely lost the liability to these manifestations, but found himself subject, in place of them, to monthly attacks of frequent and copious urination, accompanied by sexual day-dreams, but by no genital excitement.[56] Such a case admirably illustrates the compensatory relation of sexual and vesical excitation. This mutual interaction is easily comprehensible when we recall the very close nervous connection which exists between the mechanisms of the sexual organs and the bladder.

Nor are such relationships found to be confined to these two centers; in a lesser degree the more remote explosive centers are also affected; all motor influences may spread to related muscles; the convulsion of laughter, for instance, seems to be often in relation with the sexual center, and Groos has suggested that the laughter which, especially in the sexually minded, often follows allusions to the genital sphere is merely an effort to dispel nascent sexual excitement by liberating an explosion of nervous energy in another direction.[57] Nervous discharges tend to spread, or to act vicariously, because the motor centers are more or less connected.[58] Of all the physiological motor explosions, the sexual orgasm, or detumescence, is the most massive, powerful, and overwhelming. So volcanic is it that to the ancient Greek philosophers it seemed to be a minor kind of epilepsy. The relief of detumescence is not merely the relief of an evacuation; it is the discharge, by the most powerful apparatus for nervous explosion in the body, of the energy accumulated and stored up in the slow process of tumescence, and that discharge reverberates through all the nervous centers in the organism.

"The sophist of Abdera said that coitus is a slight fit of epilepsy, judging it to be an incurable disease." (Clement of

Alexandria, *_Pædagogus_*, bk. ii, chapter x.) And Coelius Aurelianus, one of the chief physicians of antiquity, said that "coitus is a brief epilepsy." Féré has pointed out that both these forms of nervous storm are sometimes accompanied by similar phenomena, by subjective sensations of sight or smell, for example; and that the two kinds of discharge may even be combined. (Féré, *_Les Epileptiques_*, pp. 283-84; also "Exces Vénériens et Epilepsie," *_Comptes-rendus de la Société de Biologie_*, April 3, 1897, and the same author's *_Instinct Sexuel_*, pp. 209, 221, and his "Priapisme Epileptique," *_La Médecine Moderne_*, February 4, 1899.) The epileptic convulsion in some cases involves the sexual mechanism, and it is noteworthy that epilepsy tends to appear at puberty. In modern times even so great a physician as Boerhaave said that coitus is a "true epilepsy," and more recently Roubaud, Hammond, and Kowalevsky have emphasized the resemblance between coitus and epilepsy, though without identifying the two states. Some authorities have considered that coitus is a cause of epilepsy, but this is denied by Christian, Strümpell, and Löwenfeld. (Löwenfeld, *_Sexualleben und Nervenleiden_*, 1899, p. 68.) Féré has recorded the case of a youth in whom the adoption of the practice of masturbation, several times a day, was followed by epileptic attacks which ceased when masturbation was abandoned. (Féré, *_Comptes-rendus de la Société de Biologie_*, April 3, 1897.)

It seems unprofitable at present to attempt any more fundamental analysis of the sexual impulse. Beaunis, in the work already quoted, vaguely suggests that we ought possibly to connect the sexual excitation which leads the male to seek the female with chemical action, either exercised directly on the protoplasm of the organism or indirectly by the intermediary of the nervous system, and especially by smell in the higher animals. Clevenger, Spitzka, Kiernan, and others have also regarded the sexual impulse as protoplasmic hunger, tracing it back to the presexual times when one protozoal form absorbed another. In the same way Joanny Roux, insisting that the sexual need is a need of the whole organism, and that "we love with the whole of our body," compares the sexual instinct to hunger, and distinguishes between "sexual hunger" affecting the whole system and "sexual appetite" as a more localized desire; he concludes that the sexual need is an aspect of the nutritive need.[59] Useful as these views are as a protest against too crude and narrow a conception of the part played by the sexual impulse, they carry us into a speculative region where proof is difficult.

We are now, however, at all events, in a better position to define the contents of the sexual impulse. We see that there are certainly, as Moll has indicated, two constituents in that impulse; but, instead of being unrelated, or only distantly related, we see that they are really so intimately connected as to form two distinct stages in the same process: a first stage, in which--usually under the parallel influence of internal and external stimuli--images, desires, and ideals grow up within the mind, while the organism generally is charged with energy and the sexual apparatus congested with blood; and a second stage, in which the sexual apparatus is discharged amid profound sexual excitement, followed by deep organic relief. By the first process is constituted the tension which the second process relieves. It seems best to call the first impulse the process of tumescence; the second the process of detumescence. [60] The first, taking on usually a more active form in the male, has the double object of bringing the male himself into the condition in which discharge becomes imperative, and at the same time arousing in the female a similar ardent state of emotional excitement and sexual turgescence. The second process has the object, directly, of discharging the tension thus produced and, indirectly, of effecting the act by which the race is propagated.

It seems to me that this is at present the most satisfactory way in which we can attempt to define the sexual impulse.

[17] Since this was written I have come across a passage in *Hampa* (p. 228), by Rafael Salillas, the Spanish sociologist, which shows that the analogy has been detected by the popular mind and been embodied in popular language: "A significant anatomico-physiological concordance supposes a resemblance between the mouth and the sexual organs of a woman, between coitus and the ingestion of food, and between foods which do not require mastication and the spermatic ejaculation; these representations find expression in the popular name *papo* given to women's genital organs. 'Papo' is the crop of birds, and is derived from 'papar' (Latin, *papare*), to eat soft food such as we call pap. With this representation of infantile food is connected the term *leche* [milk] as applied to the ejaculated genital fluid." Cleland, it may be added, in the most remarkable of English erotic novels, *The Memoirs of Fanny Hill*, refers to "the compressive exsuction with which the sensitive mechanism of that part [the vaginal] thirstily draws and drains the nipple of Love," and proceeds to compare it to the action of the child at the breast. It appears that, in some parts of the animal world at least, there is a real analogy of formation between the oral and vaginal ends of the trunk. This is notably the case in some insects, and the point has been elaborately discussed by Walter Wesché, "The Genitalia of Both the Sexes in Diptera, and their Relation to the Armature of the Mouth," *Transactions of the Linnean Society*, second series, vol. ix, Zoölogy, 1906.

[18] Näcke now expresses himself very dubiously on the point; see, e.g., *Archiv für Kriminal-Anthropologie*, 1905, p. 186.

[19] *Untersuchungen über die Libido Sexualis*, Berlin, 1897-98.

[20] Moll adopts the term "impulse of detumescence" (_Detumescenztrieb_) instead of "impulse of ejaculation," because in women there is either no ejaculation or it cannot be regarded as essential.

[21] I quote from the second edition, as issued in 1881.

[22] This is the theory which by many has alone been seen in Darwin's _Descent of Man_. Thus even his friend Wallace states unconditionally (_Tropical Nature_, p. 193) that Darwin accepted a "voluntary or conscious sexual selection," and seems to repeat the same statement in _Darwinism_ (1889), p. 283. Lloyd Morgan, in his discussion of the pairing instinct in _Habit and Instinct_ (1896), seems also only to see this side of Darwin's statement.

[23] In his _Variation of Animals and Plants under Domestication_, Darwin was puzzled by the fact that, in captivity, animals often copulate without conceiving and failed to connect that fact with the processes behind his own theory of sexual selection.

[24] Beaunis, _Sensations Internes_, ch. v, "Besoins Sexuels," 1889. It may be noted that many years earlier Burdach (in his _Physiologie als Erfahrungswissenschaft_, 1826) had recognized that the activity of the male favored procreation, and that mental and physical excitement seemed to have the same effect in the female also.

[25] It is scarcely necessary to point out that this is too extreme a position. As J.G. Millais remarks of ducks (_Natural History of British Ducks_, p. 45), in courtship "success in winning the admiration of the female is rather a matter of persistent and active attention than physical force," though the males occasionally fight over the female. The ruff (_Machetes pugnax_) is a pugnacious bird, as his name indicates. Yet, the reeve, the female of this species, is, as E. Selous shows ("Sexual Selection in Birds," _Zoölogist_, Feb. and May, 1907), completely mistress of the situation. "She seems the plain and unconcerned little mistress of a numerous and handsome seraglio, each member of which, however he flounce and bounce, can only wait to be chosen." Any fighting among the males is only incidental and is not a factor in selection. Moreover, as R. Müller points out (loc. cit., p. 290), fighting would not usually attain the end desired, for if the males expend their time and strength in a serious combat they merely afford a third less pugnacious male a better opportunity of running off with the prize.

[26] L. Tillier, *_L'Instinct Sexuel_*, 1889, pp. 74, 118, 119, 124 et seq., 289.

[27] K. Groos, *_Die Spiele der Thiere_*, 1896; *_Die Spiele der Menschen_*, 1899; both are translated into English.

[28] Prof. H.E. Ziegler, in a private letter to Professor Groos, *_Spiele der Thiere_*, p. 202.

[29] *_Die Spiele der Thiere_*, p. 244. This had been briefly pointed out by earlier writers. Thus, Haeckel (*_Gen. Morph._*, ii, p. 244) remarked that fighting for females is a special or modified kind of struggle for existence, and that it acts on both sexes.

[30] It may be added that in the human species, as Bray remarks ("Le Beau dans la Nature," *_Revue Philosophique_*, October, 1901, p. 403), "the hymen would seem to tend to the same end, as if nature had wished to reinforce by a natural obstacle the moral restraint of modesty, so that only the vigorous male could insure his reproduction." There can be no doubt that among many animals pairing is delayed so far as possible until maturity is reached. "It is a strict rule amongst birds," remarks J.G. Millais (op. cit., p. 46), "that they do not breed until both sexes have attained the perfect adult plumage." Until that happens, it seems probable, the conditions for sexual excitation are not fully established. We know little, says Howard (*_Zoölogist_*, 1903, p. 407), of the age at which birds begin to breed, but it is known that "there are yearly great numbers of individuals who do not breed, and the evidence seems to show that such individuals are immature."

[31] A. Marro, *_La Puberté_*, 1901, p. 464.

[32] Lloyd Morgan, *_Animal Behavior_*, 1900, pp. 264-5. It may be added that, on the esthetic side, Hirn, in his study (*_The Origins of Art_*, 1900), reaches conclusions which likewise, in the main, concord with those of Groos.

[33] It may be noted that the marriage ceremony itself is often of the nature of a courtship, a symbolic courtship, embodying a method of attaining tumescence. As Crawley, who has brought out this point, puts it, "Marriage-rites of union are essentially identical with love charms," and he refers in illustration to the custom of the Australian Arunta, among whom the man or woman by making music on the bull-roarer compels a person

of the opposite sex to court him or her, the marriage being thus completed. (E. Crawley, The Mystic Rose, p. 318.)

[34] The more carefully animals are observed, the more often this is found to be the case, even with respect to species which possess no obvious and elaborate process for obtaining tumescence. See, for instance, the detailed and very instructive account--too long to quote here--given by E. Selous of the preliminaries to intercourse practised by a pair of great crested grebes, while nest-building. Intercourse only took place with much difficulty, after many fruitless invitations, more usually given by the female. ("Observational Diary of the Habits of the Great Crested Grebe," Zöologist, September, 1901.) It is exactly the same with savages. The observation of Foley (Bulletin de la Société d'Anthropologie de Paris, November 6, 1879) that in savages "sexual erethism is very difficult" is of great significance and certainly in accordance with the facts. This difficulty of erethism is the real cause of many savage practices which to the civilized person often seem perverse; the women of the Caroline Islands, for instance, as described by Finsch, require the tongue or even the teeth to be applied to the clitoris, or a great ant to be applied to bite the parts, in order to stimulate orgasm. Westermarck, after quoting a remark of Mariner's concerning the women of Tonga,--"it must not be supposed that these women are always easily won; the greatest attentions and the most fervent solicitations are sometimes requisite, even though there be no other lover in the way,"--adds that these words "hold true for a great many, not to say all, savage and barbarous races now existing." (Human Marriage, p. 163.) The old notions, however, as to the sexual licentiousness of peoples living in natural conditions have scarcely yet disappeared. See Appendix A; "The Sexual Instinct in Savages."

[35] In men a certain degree of tumescence is essential before coitus can be effected at all; in women, though tumescence is not essential to coitus, it is essential to orgasm and the accompanying physical and psychic relief. The preference which women often experience for prolonged coitus is not, as might possibly be imagined, due to sensuality, but has a profound physiological basis.

[36] Stanley Hall, Adolescence, vol. i, p. 223.

[37] See Lagrange's Physiology of Bodily Exercise, especially chapter ii. It is a significant fact that, as Sergi remarks (Les Emotions, p. 330), the physiological results of dancing are identical with the physiological results of pleasure.

[38] Groos, *„Spiele der Menschen“*, p. 112. Zmigrodzki (*„Die Mutter bei den Volkern des Arischen Stammes“*, p. 414 et seq.) has an interesting passage describing the dance--especially the Russian dance--in its orgiastic aspects.

[39] Féré, "L'Influence sur le Travail Volontaire d'un muscle de l'activité d'autres muscles," *„Nouvelles Iconographie de la Salpêtrière“*, 1901.

[40] "The sensation of motion," Kline remarks ("The Migratory Impulse," *„American Journal of Psychology“*, October, 1898, p. 62), "as yet but little studied from a pleasure-pain standpoint, is undoubtedly a pleasure-giving sensation. For Aristippus the end of life is pleasure, which he defines as gentle motion. Motherhood long ago discovered its virtue as furnished by the cradle. Galloping to town on the parental knee is a pleasing pastime in every nursery. The several varieties of swings, the hammock, see-saw, flying-jenny, merry-go-round, shooting the chutes, sailing, coasting, rowing, and skating, together with the fondness of children for rotating rapidly in one spot until dizzy and for jumping from high places, are all devices and sports for stimulating the sense of motion. In most of these modes of motion the body is passive or semipassive, save in such motions as skating and rotating on the feet. The passiveness of the body precludes any important contribution of stimuli from kinesthetic sources. The stimuli are probably furnished, as Dr. Hall and others have suggested, by a redistribution of fluid pressure (due to the unusual motions and positions of the body) to the inner walls of the several vascular systems of the body."

[41] *„Anatomy of Melancholy“*, part iii., sect. ii, mem. ii, subs. iv.

[42] Sadger, "Haut-, Schleimhaut-, und Muskel-erotik," *„Jahrbuch für psychoanalytische Forschungen“*, Bd. iii, 1912, p. 556.

[43] Marro (*„Pubertà“*, p. 367 et seq.) has some observations on this point. It was an insight into this action of dancing which led the Spanish clergy of the eighteenth century to encourage the national enthusiasm for dancing (as Baretti informs us) in the interests of morality.

[44] It is scarcely necessary to remark that a primitive dance, even when associated with courtship, is not necessarily a sexual pantomime; as Wallaschek, in his comprehensive survey of primitive dances, observes, it

is more usually an animal pantomime, but nonetheless connected with the sexual instinct, separation of the sexes, also, being no proof to the contrary. (Wallaschek, *Primitive Music*, pp. 211-13.) Grosse (*Anfänge der Kunst*, English translation, p. 228) has pointed out that the best dancer would be the best fighter and hunter, and that sexual selection and natural selection would thus work in harmony.

[45] Féré, "Le plaisir de la vue du Mouvement," *Comptes-rendus de la Société de Biologie*, November 2, 1901; also *Travail et Plaisir*, ch. xxix.

[46] Groos repeatedly emphasizes the significance of this fact (*Spiele der Menschen*, pp. 81-9, 460 et seq.); Grosse (*Anfänge der Kunst*, p. 215) had previously made some remarks on this point.

[47] M. Kulischer, "Die Geschlechtliche Zuchtwahl bei den Menschen in der Urzeit," *Zeitschrift für Ethnologie*, 1876, p. 140 et seq.

[50] See, e.g., Féré, *L'Instinct Sexuel*, pp. 222-23: Brantôme was probably the first writer in modern times who referred to this phenomenon. MacGillicuddy (*Functional Disorders of the Nervous System in Women*, p. 110) refers to the case of a lady who always had sudden and uncontrollable expulsion of urine whenever her husband even began to perform the marital act, on which account he finally ceased intercourse with her. Kubary states that in Ponape (Western Carolines) the men are accustomed to titillate the vulva of their women with the tongue until the excitement is so intense that involuntary emission of urine takes place; this is regarded as the proper moment for intercourse.

[51] Thus Pitres and Régis (*Transactions of the International Medical Congress, Moscow*, vol. iv, p. 19) record the case of a young girl whose life was for some years tormented by a groundless fear of experiencing an irresistible desire to urinate. This obsession arose from once seeing at a theater a man whom she liked, and being overcome by sexual feeling accompanied by so strong a desire to urinate that she had to leave the theater. An exactly similar case in a young woman of erotic temperament, but prudish, has been recorded by Freud (*Zur Neurosenlehre*, Bd. i, p.

54). Morbid obsessions of modesty involving the urinary sphere and appearing at puberty are evidently based on transformed sexual emotion. Such a case has been recorded by Marandon de Montyel (*_Archives de Neurologie_*, vol. xii, 1901, p. 36); this lady, who was of somewhat neuropathic temperament, from puberty onward, in order to be able to urinate found it necessary not only to be absolutely alone, but to feel assured that no one even knew what was taking place.

[52] H. Ellis, "The Bladder as a Dynamometer," *_American Journal of Dermatology_*, May, 1902.

[53] Sir W. Gowers, "Minor Epilepsy," *_British Medical Journal_*, January 6, 1900; *ib.*, *_Epilepsy_*, 2d ed., 1901, p. 106; see also H. Ellis, art. "Urinary Bladder, Influence of the Mind on the," in Tuke's *_Dictionary of Psychological Medicine_*.

[54] Sérieux, *_Recherches Cliniques sur les Anomalies de l'Instinct Sexuel_*, p. 22.

[55] Emil Schultze-Malkowsky, "Der Sexuelle Trieb in Kindesalter," *_Geschlecht und Gesellschaft_*, vol. ii, part 8, p. 372.

[56] Féré, "Note sur un Cas de Periodicité Sexuelle chez l'Homme," *_Comptes-rendus Société de Biologie_*, July 23, 1904.

[57] It is a familiar fact that, in women, occasionally, a violent explosion of laughter may be propagated to the bladder-center and produce urination. "She laughed till she nearly wetted the floor," I have heard a young woman in the country say, evidently using without thought a familiar locution. Professor Bechterew has recorded the case of a young married lady who, from childhood, wherever she might be--in friends' houses, in the street, in her own drawing-room--had always experienced an involuntary and forcible emission of urine, which could not be stopped or controlled, whenever she laughed; the bladder was quite sound and no muscular effort produced the same result. (W. Bechterew, *_Neurologisches Centralblatt_*, 1899.) In women these relationships are most easily observed, partly because in them the explosive centers are more easily discharged, and partly, it is probable, so far as the bladder is concerned, because, although after death the resistance to the emission of urine is notably less in women, during life about the same amount of force is necessary in both sexes; so that a greater amount of energy flows to the bladder in women, and any nervous storm or disturbance is thus specially apt to

affect the bladder.

[58] "Every pain," remarks Marie de Manacéine, "produces a number of movements which are apparently useless: we cry out, we groan, we move our limbs, we throw ourselves from one side to the other, and at bottom all these movements are logical because by interrupting and breaking our attention they render us less sensitive to the pain. In the days before chloroform, skillful surgeons requested their patients to cry out during the operation, as we are told by Gratiolet, who could not explain so strange a fact, for in his time the antagonism of movements and attention was not recognized." (Marie de Manacéine, *_Archives Italiennes de Biologie_*, 1894, p. 250.) This antagonism of attention by movement is but another way of expressing the vicarious relationship of motor discharges.

[59] Joanny Roux, *_Psychologie de l'Instinct Sexuel_*, 1899, pp. 22-23. It is disputed whether hunger is located in the whole organism, and powerful arguments have been brought against the view. (W. Cannon, "The Nature of Hunger," *_Popular Science Monthly_*, Sept., 1912.) Thirst is usually regarded as organic (A. Mayer, *_La Soif_*, 1901).

[60] If there is any objection to these terms it is chiefly because they have reference to vascular congestion rather than to the underlying nervous charging and discharging, which is equally fundamental, and in man more prominent than the vascular phenomena.

LOVE AND PAIN.

I.

The Chief Key to the Relationship between Love and Pain to be Found in Animal Courtship--Courtship a Source of Combativity and of Cruelty--Human Play in the Light of Animal Courtship--The Frequency of Crimes Against the Person in Adolescence--Marriage by Capture and its Psychological Basis--Man's Pleasure in Exerting Force and Woman's Pleasure in Experiencing it--Resemblance of Love to Pain even in Outward Expression--The Love-bite--In what Sense Pain may be Pleasurable--The Natural Contradiction in the Emotional Attitude of Women Toward Men--Relative Insensibility to Pain of the Organic Sexual Sphere in Women--The Significance of the Use of the Ampallang and Similar Appliances

in Coitus--The Sexual Subjection of Women to Men in Part Explainable as the Necessary Condition for Sexual Pleasure.

The relation of love to pain is one of the most difficult problems, and yet one of the most fundamental, in the whole range of sexual psychology. Why is it that love inflicts, and even seeks to inflict, pain? Why is it that love suffers pain, and even seeks to suffer it? In answering that question, it seems to me, we have to take an apparently circuitous route, sometimes going beyond the ostensible limits of sex altogether; but if we can succeed in answering it we shall have come very near one of the great mysteries of love. At the same time we shall have made clear the normal basis on which rest the extreme aberrations of love.

The chief key to the relationship of love to pain is to be found by returning to the consideration of the essential phenomena of courtship in the animal world generally. Courtship is a play, a game; even its combats are often, to a large extent, mock-combats; but the process behind it is one of terrible earnestness, and the play may at any moment become deadly. Courtship tends to involve a mock-combat between males for the possession of the female which may at any time become a real combat; it is a pursuit of the female by the male which may at any time become a kind of persecution; so that, as Colin Scott remarks, "Courting may be looked upon as a refined and delicate form of combat." The note of courtship, more especially among mammals, is very easily forced, and as soon as we force it we reach pain.[61] The intimate and inevitable association in the animal world of combat--of the fighting and hunting impulses--with the process of courtship alone suffices to bring love into close connection with pain.

Among mammals the male wins the female very largely by the display of force. The infliction of pain must inevitably be a frequent indirect result of the exertion of power. It is even more than this; the infliction of pain by the male on the female may itself be a gratification of the impulse to exert force. This tendency has always to be held in check, for it is of the essence of courtship that the male should win the female, and she can only be won by the promise of pleasure. The tendency of the male to inflict pain must be restrained, so far as the female is concerned, by the consideration of what is pleasing to her. Yet, the more carefully we study the essential elements of courtship, the clearer it becomes that, playful as these manifestations may seem on the surface, in every direction they are verging on pain. It is so among animals generally; it

is so in man among savages. "It is precisely the alliance of pleasure and pain," wrote the physiologist Burdach, "which constitutes the voluptuous emotion."

Nor is this emotional attitude entirely confined to the male. The female also in courtship delights to arouse to the highest degree in the male the desire for her favors and to withhold those favors from him, thus finding on her part also the enjoyment of power in cruelty. "One's cruelty is one's power," Millamant says in Congreve's *Way of the World*, "and when one parts with one's cruelty one parts with one's power."

At the outset, then, the impulse to inflict pain is brought into courtship, and at the same time rendered a pleasurable idea to the female, because with primitive man, as well as among his immediate ancestors, the victor in love has been the bravest and strongest rather than the most beautiful or the most skilful. Until he can fight he is not reckoned a man and he cannot hope to win a woman. Among the African Masai a man is not supposed to marry until he has blooded his spear, and in a very different part of the world, among the Dyaks of Borneo, there can be little doubt that the chief incentive to head-hunting is the desire to please the women, the possession of a head decapitated by himself being an excellent way of winning a maiden's favor.[62] Such instances are too well known to need multiplication here, and they survive in civilization, for, even among ourselves, although courtship is now chiefly ruled by quite other considerations, most women are in some degree emotionally affected by strength and courage. But the direct result of this is that a group of phenomena with which cruelty and the infliction of pain must inevitably be more or less allied is brought within the sphere of courtship and rendered agreeable to women. Here, indeed, we have the source of that love of cruelty which some have found so marked in women. This is a phase of courtship which helps us to understand how it is that, as we shall see, the idea of pain, having become associated with sexual emotion, may be pleasurable to women.

Thus, in order to understand the connection between love and pain, we have once more to return to the consideration, under a somewhat new aspect, of the fundamental elements in the sexual impulse. In discussing the "Evolution of Modesty" we found that the primary part of the female in courtship is the playful, yet serious, assumption of the rôle of a hunted animal who lures on the pursuer, not with the object of escaping, but with the object of being finally caught. In considering the "Analysis of the Sexual Impulse" we found that the primary part of the male in courtship is

by the display of his energy and skill to capture the female or to arouse in her an emotional condition which leads her to surrender herself to him, this process itself at the same time heightening his own excitement. In the playing of these two different parts is attained in both male and female that charging of nervous energy, that degree of vascular tumescence, necessary for adequate discharge and detumescence in an explosion by which sperm-cells and germ-cells are brought together for the propagation of the race. We are now concerned with the necessary interplay of the differing male and female rôles in courtship, and with their accidental emotional by-products. Both male and female are instinctively seeking the same end of sexual union at the moment of highest excitement. There cannot, therefore, be real conflict.[63] But there is the semblance of a conflict, an apparent clash of aim, an appearance of cruelty. Moreover,--and this is a significant moment in the process from our present point of view,--when there are rivals for the possession of one female there is always a possibility of actual combat, so tending to introduce an element of real violence, of undisguised cruelty, which the male inflicts on his rival and which the female views with satisfaction and delight in the prowess of the successful claimant. Here we are brought close to the zoölogical root of the connection between love and pain.[64]

In his admirable work on play in man Groos has fully discussed the plays of combat (Kampfspiele), which begin to develop even in childhood and assume full activity during adolescence; and he points out that, while the impulse to such play certainly has a wider biological significance, it still possesses a relationship to the sexual life and to the rivalries of animals in courtship which must not be forgotten.[65]

Nor is it only in play that the connection between love and combativity may still be traced. With the epoch of the first sexual relationship, Marro points out, awakes the instinct of cruelty, which prompts the youth to acts which are sometimes in absolute contrast to his previous conduct, and leads him to be careless of the lives of others as well as of his own life.[66] Marro presents a diagram showing how crimes against the person in Italy rise rapidly from the age of 16 to 20 and reach a climax between 21 and 25. In Paris, Gamier states, crimes of blood are six times more frequent in adolescents (aged 16 to 20) than in adults. It is the same elsewhere.[67] This tendency to criminal violence during the age-period of courtship is a by-product of the sexual impulse, a kind of tertiary sexual character.

In the process of what is commonly termed "marriage by capture" we have a

method of courtship which closely resembles the most typical form of animal courtship, and is yet found in all but the highest and most artificial stages of human society. It may not be true that, as MacLennan and others have argued, almost every race of man has passed through an actual stage of marriage by capture, but the phenomena in question have certainly been extremely widespread and exist in popular custom even among the highest races today. George Sand has presented a charming picture of such a custom, existing in France, in her *Mare au Diable*. Farther away, among the Kirghiz, the young woman is pursued by all her lovers, but she is armed with a formidable whip, which she does not hesitate to use if overtaken by a lover to whom she is not favorable. Among the Malays, according to early travelers, courtship is carried on in the water in canoes with double-bladed paddles; or, if no water is near, the damsel, stripped naked of all but a waistband, is given a certain start and runs off on foot followed by her lover. Vaughan Stevens in 1896 reported that this performance is merely a sport; but Skeat and Blagden, in their more recent and very elaborate investigations in the Malay States, find that it is a rite.

Even if we regard "marriage by capture" as simply a primitive human institution stimulated by tribal exigencies and early social conditions, yet, when we recall its widespread and persistent character, its close resemblance to the most general method of courtship among animals, and the emotional tendencies which still persist even in the most civilized men and women, we have to recognize that we are in presence of a real psychological impulse which cannot fail in its exercise to introduce some element of pain into love.

There are, however, two fundamentally different theories concerning "marriage by capture." According to the first, that of MacLennan, which, until recently, has been very widely accepted, and to which Professor Tylor has given the weight of his authority, there has really been in primitive society a recognized stage in which marriages were effected by the capture of the wife. Such a state of things MacLennan regarded as once world-wide. There can be no doubt that women very frequently have been captured in this way among primitive peoples. Nor, indeed, has the custom been confined to savages. In Europe we find that even up to comparatively recent times the abduction of women was not only very common, but was often more or less recognized. In England it was not until Henry VII's time that the violent seizure of a woman was made a criminal offense, and even then the statute was limited to women possessed of lands and goods. A man might still carry off a girl provided she was not an heiress; but even

the abduction of heiresses continued to be common, and in Ireland remained so until the end of the eighteenth century. But it is not so clear that such raids and abductions, even when not of a genuinely hostile character, have ever been a recognized and constant method of marriage.

According to the second set of theories, the capture is not real, but simulated, and may be accounted for by psychological reasons. Fustel de Coulanges, in *_La Cité Antique_*, [68] discussing simulated marriage by capture among the Romans, mentioned the view that it was "a symbol of the young girl's modesty," but himself regarded it as an act of force to symbolize the husband's power. He was possibly alluding to Herbert Spencer, who suggested a psychological explanation of the apparent prevalence of marriage by capture based on the supposition that, capturing a wife being a proof of bravery, such a method of obtaining a wife would be practised by the strongest men and be admired, while, on the other hand, he considered that "female coyness" was "an important factor" in constituting the more formal kinds of marriage by capture ceremonial. [69] Westermarck, while accepting true marriage by capture, considers that Spencer's statement "can scarcely be disproved." [70] In his valuable study of certain aspects of primitive marriage Crawley, developing the explanation rejected by Fustel de Coulanges, regards the fundamental fact to be the modesty of women, which has to be neutralized, and this is done by "a ceremonial use of force, which is half real and half make-believe." Thus the manifestations are not survivals, but "arising in a natural way from normal human feelings. It is not the tribe from which the bride is abducted, nor, primarily, her family and kindred, but her *_sex_*"; and her "sexual characters of timidity, bashfulness, and passivity are sympathetically overcome by make-believe representations of male characteristic actions." [71]

It is not necessary for the present purpose that either of these two opposing theories concerning the origin of the customs and feelings we are here concerned with should be definitely rejected. Whichever theory is adopted, the fundamental psychic element which here alone concerns us still exists intact. [72] It may be pointed out, however, that we probably have to accept two groups of such phenomena: one, seldom or never existing as the sole form of marriage, in which the capture is real; and another in which the "capture" is more or less ceremonial or playful. The two groups coexist among the Turcomans, as described by Vambery, who are constantly capturing and enslaving the Persians of both sexes, and, side by side with this, have a marriage ceremonial of mock-capture of entirely playful character. At the same time the two groups sometimes overlap, as is

indicated by cases in which, while the "capture" appears to be ceremonial, the girl is still allowed to escape altogether if she wishes. The difficulty of disentangling the two groups is shown by the fact that so careful an investigator as Westermarck cites cases of real capture and mock-capture together without attempting to distinguish between them. From our present point of view it is quite unnecessary to attempt such a distinction. Whether the capture is simulated or real, the man is still playing the masculine and aggressive part proper to the male; the woman is still playing the feminine and defensive part proper to the female. The universal prevalence of these phenomena is due to the fact that manifestations of this kind, real or pretended, afford each sex the very best opportunity for playing its proper part in courtship, and so, even when the force is real, must always gratify a profound instinct.

It is not necessary to quote examples of marriage by capture from the numerous and easily accessible books on the evolution of marriage. (Sir A.B. Ellis, adopting MacLennan's standpoint, presented a concise statement of the facts in an article on "Survivals from Marriage by Capture," *Popular Science Monthly*, 1891, p. 207.) It may, however, be worth while to bring together from scattered sources a few of the facts concerning the phenomena in this group and their accompanying emotional state, more especially as they bear on the association of love with force, inflicted or suffered.

In New Caledonia, Foley remarks, the successful coquette goes off with her lover into the bush. "It usually happens that, when she is successful, she returns from her expedition, tumbled, beaten, scratched, even bitten on the nape and shoulders, her wounds thus bearing witness to the quadrupedal attitude she has assumed amid the foliage." (Foley, *Bulletin de la Société d'Anthropologie*, Paris, November 6, 1879.)

Of the natives of New South Wales, Turnbull remarked at the beginning of the nineteenth century that "their mode of courtship is not without its singularity. When a young man sees a female to his fancy he informs her she must accompany him home; the lady refuses; he not only enforces compliance with threats but blows; thus the gallant, according to the custom, never fails to gain the victory, and bears off the willing, though struggling pugilist. The colonists for some time entertained the idea that the women were compelled and forced away against their

inclinations; but the young ladies informed them that this mode of gallantry was the custom, and perfectly to their taste," (J. Turnbull, A Voyage Round the World, 1813, p. 98; cf. Brough Smyth, Aborigines of Victoria, 1878, vol. i, p. 81.)

As regards capture of women among Central Australian tribes, Spencer and Gillen remark: "We have never in any of these central tribes met with any such thing, and the clubbing part of the story may be dismissed, so far as the central area of the continent is concerned. To the casual observer what looks like a capture (we are, of course, only speaking of these tribes) is in reality an elopement, in which the woman is an aiding and abetting party." (Northern Tribes of Central Australia, p. 32.)

"The New Zealand method of courtship and matrimony is a most extraordinary one. A man sees a woman whom he fancies he should like for a wife; he asks the consent of her father, or, if an orphan, of her nearest relative, which, if he obtain, he carries his intended off by force, she resisting with all her strength, and, as the New Zealand girls are generally fairly robust, sometimes a dreadful struggle takes place; both are soon stripped to the skin and it is sometimes the work of hours to remove the fair prize a hundred yards. It sometimes happens that she secures her retreat into her father's house, and the lover loses all chance of ever obtaining her." (A. Earle, Narratives of Residence in New Zealand, 1832, p. 244.)

Among the Eskimos (probably near Smith Sound) "there is no marriage ceremony further than that the boy is required to carry off his bride by main force, for even among these blubber-eating people the woman only saves her modesty by a show of resistance, although she knows years beforehand that her destiny is sealed and that she is to become the wife of the man from whose embraces, when the nuptial day comes, she is obliged by the inexorable law of public opinion to free herself, if possible, by kicking and screaming with might and main until she is safely landed in the hut of her future lord, when she gives up the combat very cheerfully and takes possession of her new abode. The betrothal often takes place at a very early period of life and at very dissimilar ages." Marriage only takes place when the lover has killed his first seal; this is the test of manhood and maturity. (J.J. Hayes, Open Polar Sea, 1867, p. 432.)

Marriage by "capture" is common in war and raiding in central Africa. "The women, as a rule," Johnston says, "make no very great resistance on these occasions. It is almost like playing a game. A woman is surprised as she goes to get water at the stream, or when she is on the way to or from the plantation. The man has only got to show her she is cornered and that escape is not easy or pleasant and she submits to be carried off. As a general rule, they seem to accept very cheerfully these abrupt changes in their matrimonial existence." (Sir H.H. Johnston, *British Central Africa*, p. 412.)

Among the wild tribes of the Malay Peninsula in one form of wedding rite the bridegroom is required to run seven times around an artificial mound decorated with flowers and the emblem of the people's religion. In the event of the bridegroom failing to catch the bride the marriage has to be postponed. Among the Orang Laut, or sea-gipsies, the pursuit sometimes takes the form of a canoe-race; the woman is given a good start and must be overtaken before she has gone a certain distance. (W.W. Skeat, *Journal Anthropological Institute*, Jan.-June, 1902, p. 134; Skeat and Blagden, *Pagan Races of the Malay*, vol. ii, p. 69 et seq., fully discuss the ceremony around the mound.)

"Calmuck women ride better than the men. A male Calmuck on horseback looks as if he was intoxicated, and likely to fall off every instant, though he never loses his seat; but the women sit with more ease, and ride with extraordinary skill. The ceremony of marriage among the Calmucks is performed on horseback. A girl is first mounted, who rides off at full speed. Her lover pursues, and if he overtakes her she becomes his wife and the marriage is consummated upon the spot, after which she returns with him to his tent. But it sometimes happens that the woman does not wish to marry the person by whom she is pursued, in which case she will not suffer him to overtake her; and we were assured that no instance occurs of a Calmuck girl being thus caught, unless she has a partiality for her pursuer. If she dislikes him, she rides, to use the language of English sportsmen, 'neck or nothing,' until she has completely escaped or until the pursuer's horse is tired out, leaving her at liberty to return, to be afterward chased by some more favored admirer." (E.D. Clarke, *Travels*, 1810, vol. i, p. 333.)

Among the Bedouins marriage is arranged between the lover and the girl's father, often without consulting the girl herself. "Among the Arabs of Sinai the young maid comes home in the evening with the cattle. At a short distance from the camp she is met by the future spouse and a couple of his young friends and carried off by force to her father's tent. If she entertains any suspicion of their designs she defends herself with stones, and often inflicts wounds on the young men, even though she does not dislike the lover, for, according to custom, the more she struggles, bites, kicks, cries, and strikes, the more she is applauded ever after by her own companions." After being taken to her father's tent, where a man's cloak is thrown over her by one of the bridegroom's relations, she is dressed in garments provided by her future husband, and placed on a camel, "still continuing to struggle in a most unruly manner, and held by the bridegroom's friends on both sides." She is then placed in a recess of the husband's tent. Here the marriage is finally consummated, "the bride still continuing to cry very loudly. It sometimes happens that the husband is obliged to tie his bride, and even to beat her, before she can be induced to comply with his desires." If, however, she really does not like her husband, she is perfectly free to leave him next morning, and her father is obliged to receive her back whether he wishes to or not. It is not considered proper for a widow or divorced woman to make any resistance on being married. (J.L. Burckhardt, *_Notes on the Bedouins and Wahábys_*, 1830, p. 149 et seq.)

Among the Turcomans forays for capturing and enslaving their Persian neighbors were once habitual. Vambery describes their "marriage ceremonial when the young maiden, attired in bridal costume, mounts a high-bred courser, taking on her lap the carcass of a lamb or goat, and setting off at full gallop, followed by the bridegroom and other young men of the party, also on horseback; she is always to strive, by adroit turns, etc., to avoid her pursuers, that no one approach near enough to snatch from her the burden on her lap. This game, called *_kökbüri_* (green wolf), is in use among all the nomads of central Asia." (A. Vambery, *_Travels in Central Asia_*, 1864, p. 323.)

In China, a missionary describes how, when he was called upon to marry the daughter of a Chinese Christian brought up in native

customs, he was compelled to wait several hours, as the bride refused to get up and dress until long after the time appointed for the wedding ceremony, and then only by force. "Extreme reluctance and dislike and fear are the true marks of a happy and lively wedding." (A.E. Moule, *_New China and Old_*, p. 128.)

It is interesting to find that in the Indian art of love a kind of mock-combat, accompanied by striking, is a recognized and normal method of heightening tumescence. Vatsyayana has a chapter "On Various Manners of Striking," and he approves of the man striking the woman on the back, belly, flanks, and buttocks, before and during coitus, as a kind of play, increasing as sexual excitement increases, which the woman, with cries and groans, pretends to bid the man to stop. It is mentioned that, especially in southern India, various instruments (scissors, needles, etc.) are used in striking, but this practice is condemned as barbarous and dangerous. (*_Kama Sutra_*, French translation, iii, chapter v.)

In the story of Aladdin, in the *_Arabian Nights_*, the bride is undressed by the mother and the other women, who place her in the bridegroom's bed "as if by force, and, according to the custom of the newly married, she pretends to resist, twisting herself in every direction, and seeking to escape from their hands." (*_Les Mille Nuits_*, tr. Mardrus, vol. xi, p. 253.)

It is said that in those parts of Germany where preliminary *_Probenächte_* before formal marriage are the rule it is not uncommon for a young woman before finally giving herself to a man to provoke him to a physical struggle. If she proves stronger she dismisses him; if he is stronger she yields herself willingly. (W. Henz, "Probenächte," *_Sexual-Probleme_*, Oct., 1910, p. 743.)

Among the South Slavs of Servia and Bulgaria, according to Krauss, it is the custom to win a woman by seizing her by the ankle and bringing her to the ground by force. This method of wooing is to the taste of the woman, and they are refractory to any other method. The custom of beating or being beaten before coitus is also found among the South Slavs. (*Kryptadia*, vol. vi, p. 209.)

In earlier days violent courtship was viewed with approval in the

European world, even among aristocratic circles. Thus in the medieval Lai de Graélent of Marie de France this Breton knight is represented as very chaste, possessing a high ideal of love and able to withstand the wiles of women. One day when he is hunting in a forest he comes upon a naked damsel bathing, together with her handmaidens. Overcome by her beauty, he seizes her clothes in case she should be alarmed, but is persuaded to hand them to her; then he proceeds to make love to her. She replies that his love is an insult to a woman of her high lineage. Finding her so proud, Graélent sees that his prayers are in vain. He drags her by force into the depth of the forest, has his will of her, and begs her very gently not to be angry, promising to love her loyally and never to leave her. The damsel saw that he was a good knight, courteous, and wise. She thought within herself that if she were to leave him she would never find a better friend.

Brantôme mentions a lady who confessed that she liked to be "half-forced" by her husband, and he remarks that a woman who is "a little difficult and resists" gives more pleasure also to her lover than one who yields at once, just as a hard-fought battle is a more notable triumph than an easily won victory. (Brantôme, Vie des Dames Galantes, discours i.) Restif de la Bretonne, again, whose experience was extensive, wrote in his Anti-Justine that "all women of strong temperament like a sort of brutality in sexual intercourse and its accessories."

Ovid had said that a little force is pleasing to a woman, and that she is grateful to the ravisher against whom she struggles (Ars Amatoria, lib. i). One of Janet's patients (Raymond and Janet, Les Obsessions et la Psychasthénie, vol. ii, p. 406) complained that her husband was too good, too devoted. "He does not know how to make me suffer a little. One cannot love anyone who does not make one suffer a little." Another hysterical woman (a silk fetichist, frigid with men) had dreams of men and animals abusing her: "I cried with pain and was happy at the same time." (Clérambault, Archives d'Anthropologie Criminelle, June, 1908, p. 442.)

It has been said that among Slavs of the lower class the wives feel hurt if they are not beaten by their husbands. Paullinus, in the seventeenth century, remarked that Russian women are never

more pleased and happy than when beaten by their husbands, and regard such treatment as proof of love. (See, e.g., C.F. von Schlichtegroll, *Sacher-Masoch und der Masochismus*, p. 69.) Krafft-Ebing believes that this is true at the present day, and adds that it is the same in Hungary, a Hungarian official having informed him that the peasant women of the Somogyer Comitatus do not think they are loved by their husbands until they have received the first box on the ear. (Krafft-Ebing, *Psychopathia Sexualis*, English translation of the tenth edition, p. 188.) I may add that a Russian proverb says "Love your wife like your soul and beat her like your *shuba*" (overcoat); and, according to another Russian proverb, "a dear one's blows hurt not long." At the same time it has been remarked that the domination of men by women is peculiarly frequent among the Slav peoples. (V. Schlichtegroll, *op. cit.*, p. 23.) Cellini, in an interesting passage in his *Life* (book ii, chapters xxxiv-xxxv), describes his own brutal treatment of his model Caterina, who was also his mistress, and the pleasure which, to his surprise, she took in it. Dr. Simon Forman, also, the astrologist, tells in his *Autobiography* (p. 7) how, as a young and puny apprentice to a hosier, he was beaten, scolded, and badly treated by the servant girl, but after some years of this treatment he turned on her, beat her black and blue, and ever after "Mary would do for him all that she could."

That it is a sign of love for a man to beat his sweetheart, and a sign much appreciated by women, is illustrated by the episode of Cariharta and Repolido, in "Rinconete and Cortadillo," one of Cervantes's *Exemplary Novels*. The Indian women of South America feel in the same way, and Mantegazza when traveling in Bolivia found that they complained when they were not beaten by their husbands, and that a girl was proud when she could say "He loves me greatly, for he often beats me." (*Fisiologia della Donna*, chapter xiii.) The same feeling evidently existed in classic antiquity, for we find Lucian, in his "Dialogues of Courtesans," makes a woman say: "He who has not rained blows on his mistress and torn her hair and her garments is not yet in love," while Ovid advises lovers sometimes to be angry with their sweethearts and to tear their dresses.

Among the Italian Camorrista, according to Russo, wives are very badly treated. Expression is given to this fact in the popular

songs. But the women only feel themselves tenderly loved when they are badly treated by their husbands; the man who does not beat them they look upon as a fool. It is the same in the east end of London. "If anyone has doubts as to the brutalities practised on women by men," writes a London magistrate, "let him visit the London Hospital on a Saturday night. Very terrible sights will meet his eye. Sometimes as many as twelve or fourteen women may be seen seated in the receiving room, waiting for their bruised and bleeding faces and bodies to be attended to. In nine cases out of ten the injuries have been inflicted by brutal and perhaps drunken husbands. The nurses tell me, however, that any remarks they may make reflecting on the aggressors are received with great indignation by the wretched sufferers. They positively will not hear a single word against the cowardly ruffians. 'Sometimes,' said a nurse to me, 'when I have told a woman that her husband is a brute, she has drawn herself up and replied: "You mind your own business, miss. We find the rates and taxes, and the likes of you are paid out of 'em to wait on us."'" (Montagu Williams, *Round London*, p. 79.)

"The prostitute really loves her *souteneur*, notwithstanding all the persecutions he inflicts on her. Their torments only increase the devotion of the poor slaves to their 'Alphonse.' Parent-Duchâtelet wrote that he had seen them come to the hospital with their eyes out of their heads, faces bleeding, and bodies torn by the blows of their drunken lovers, but as soon as they were healed they went back to them. Police-officers tell us that it is very difficult to make a prostitute confess anything concerning her *souteneur*. Thus, Rosa L., whom her 'Alphonse' had often threatened to kill, even putting the knife to her throat, would say nothing, and denied everything when the magistrate questioned her. Maria R., with her face marked by a terrible scar produced by her *souteneur*, still carefully preserved many years afterward the portrait of the aggressor, and when we asked her to explain her affection she replied: 'But he wounded me because he loved me.' The *souteneur's* brutality only increases the ill-treated woman's love; the humiliation and slavery in which the woman's soul is drowned feed her love." (Niceforo, *Il Gergo*, etc., 1897, p. 128.)

In a modern novel written in autobiographic form by a young Australian lady the heroine is represented as striking her

betrothed with a whip when he merely attempts to kiss her. Later on her behavior so stings him that his self-control breaks down and he seizes her fiercely by the arms. For the first time she realizes that he loves her. "I laughed a joyous little laugh, saying 'Hal, we are quits'; when on disrobing for the night I discovered on my soft white shoulders and arms--so susceptible to bruises--many marks, and black. It had been a very happy day for me." (Miles Franklin, My Brilliant Career.)

It is in large measure the existence of this feeling of attraction for violence which accounts for the love-letters received by men who are accused of crimes of violence. Thus in one instance, in Chicago (as Dr. Kiernan writes to me), "a man arrested for conspiracy to commit abortion, and also suspected of being a sadist, received many proposals of marriage and other less modest expressions of affection from unknown women. To judge by the signatures, these women belonged to the Germans and Slavs rather than to the Anglo-Celts."

Neuropathic or degenerative conditions sometimes serve to accentuate or reveal ancestral traits that are very ancient in the race. Under such conditions the tendency to find pleasure in subjection and pain, which is often faintly traceable even in normal civilized women, may become more pronounced. This may be seen in a case described in some detail in the Archivio di Psichiatria. The subject was a young lady of 19, of noble Italian birth, but born in Tunis. On the maternal side there is a somewhat neurotic heredity, and she is herself subject to attacks of hystero-epileptoid character. She was very carefully, but strictly, educated; she knows several languages, possesses marked intellectual aptitudes, and is greatly interested in social and political questions, in which she takes the socialistic and revolutionary side. She has an attractive and sympathetic personality; in complexion she is dark, with dark eyes and very dark and abundant hair; the fine down on the upper lip and lower parts of the cheeks is also much developed; the jaw is large, the head acrocephalic, and the external genital organs of normal size, but rather asymmetric. Ever since she was a child she has loved to work and dream in solitude. Her dreams have always been of love, since menstruation began as early as the age of 10, and accompanied by strong sexual feelings, though at that age these feelings remained vague and indefinite; but in them the desire

for pleasure was always accompanied by the desire for pain, the desire to bite and destroy something, and, as it were, to annihilate herself. She experienced great relief after periods of "erotic rumination," and if this rumination took place at night she would sometimes masturbate, the contact of the bedclothes, she said, giving her the illusion of a man. In time this vague longing for the male gave place to more definite desires for a man who would love her, and, as she imagined, strike her. Eventually she formed secret relationships with two or three lovers in succession, each of these relationships being, however, discovered by her family and leading to ineffectual attempts at suicide. But the association of pain with love, which had developed spontaneously in her solitary dreams, continued in her actual relations with her lovers. During coitus she would bite and squeeze her arms until the nails penetrated the flesh. When her lover asked her why at the moment of coitus she would vigorously repel him, she replied: "Because I want to be possessed by force, to be hurt, suffocated, to be thrown down in a struggle." At another time she said: "I want a man with all his vitality, so that he can torture and kill my body." We seem to see here clearly the ancient biological character of animal courtship, the desire of the female to be violently subjugated by the male. In this case it was united to sensitiveness to the sexual domination of an intellectual man, and the subject also sought to stimulate her lovers' intellectual tastes. (_Archivio di Psichiatria_, vol. xx, fasc. 5-6, p. 528.)

This association between love and pain still persists even among the most normal civilized men and women possessing well-developed sexual impulses. The masculine tendency to delight in domination, the feminine tendency to delight in submission, still maintain the ancient traditions when the male animal pursued the female. The phenomena of "marriage by capture," in its real and its simulated forms, have been traced to various causes. But it has to be remembered that these causes could only have been operative in the presence of a favorable emotional aptitude, constituted by the zoölogical history of our race and still traceable even today. To exert power, as psychologists well recognize, is one of our most primary impulses, and it always tends to be manifested in the attitude of a man toward the woman he loves.[73]

It might be possible to maintain that the primitive element of more or less latent cruelty in courtship tends to be more rather than less marked

in civilized man. In civilization the opportunity of dissipating the surplus energy of the courtship process by inflicting pain on rivals usually has to be inhibited; thus the woman to be wooed tends to become the recipient of the whole of this energy, both in its pleasure-giving and its pain-giving aspects. Moreover, the natural process of courtship, as it exists among animals and usually among the lower human races, tends to become disguised and distorted in civilization, as well by economic conditions as by conventional social conditions and even ethical prescription. It becomes forgotten that the woman's pleasure is an essential element in the process of courtship. A woman is often reduced to seek a man for the sake of maintenance; she is taught that pleasure is sinful or shameful, that sex-matters are disgusting, and that it is a woman's duty, and also her best policy, to be in subjection to her husband. Thus, various external checks which normally inhibit any passing over of masculine sexual energy into cruelty are liable to be removed.

We have to admit that a certain pleasure in manifesting his power over a woman by inflicting pain upon her is an outcome and survival of the primitive process of courtship, and an almost or quite normal constituent of the sexual impulse in man. But it must be at once added that in the normal well-balanced and well-conditioned man this constituent of the sexual impulse, when present, is always held in check. When the normal man inflicts, or feels the impulse to inflict, some degree of physical pain on the woman he loves he can scarcely be said to be moved by cruelty. He feels, more or less obscurely, that the pain he inflicts, or desires to inflict, is really a part of his love, and that, moreover, it is not really resented by the woman on whom it is exercised. His feeling is by no means always according to knowledge, but it has to be taken into account as an essential part of his emotional state. The physical force, the teasing and bullying, which he may be moved to exert under the stress of sexual excitement, are, he usually more or less unconsciously persuades himself, not really unwelcome to the object of his love.[74] Moreover, we have to bear in mind the fact--a very significant fact from more than one point of view--that the normal manifestations of a woman's sexual pleasure are exceedingly like those of pain. "The outward expressions of pain," as a lady very truly writes,--"tears, cries, etc.,--which are laid stress on to prove the cruelty of the person who inflicts it, are not so different from those of a woman in the ecstasy of passion, when she implores the man to desist, though that is really the last thing she desires."[75] If a man is convinced that he is causing real and unmitigated pain, he becomes repentant at once. If this is not the case he must either be regarded as a radically abnormal person or as carried away by passion to a point of

temporary insanity.

The intimate connection of love with pain, its tendency to approach cruelty, is seen in one of the most widespread of the occasional and non-essential manifestations of strong sexual emotion, especially in women, the tendency to bite. We may find references to love-bites in the literature of ancient as well as of modern times, in the East as well as in the West. Plautus, Catullus, Propertius, Horace, Ovid, Petronius, and other Latin writers refer to bites as associated with kisses and usually on the lips. Plutarch says that Flora, the mistress of Cnæus Pompey, in commending her lover remarked that he was so lovable that she could never leave him without giving him a bite. In the Arabic *_Perfumed Garden_* there are many references to love-bites, while in the Indian *_Kama Sutra_* of Vatsyayana a chapter is devoted to this subject. Biting in love is also common among the South Slavs.[76] The phenomenon is indeed sufficiently familiar to enable Heine, in one of his *_Romancero_*, to describe those marks by which the ancient chronicler states that Edith Swanneck recognized Harold, after the Battle of Hastings, as the scars of the bites she had once given him.

It would be fanciful to trace this tendency back to that process of devouring to which sexual congress has, in the primitive stages of its evolution, been reduced. But we may probably find one of the germs of the love-bite in the attitude of many mammals during or before coitus; in attaining a firm grip of the female it is not uncommon (as may be observed in the donkey) for the male to seize the female's neck between his teeth. The horse sometimes bites the mare before coitus and it is said that among the Arabs when a mare is not apt for coitus she is sent to pasture with a small ardent horse, who excites her by playing with her and biting her.[77] It may be noted, also, that dogs often show their affection for their masters by gentle bites. Children also, as Stanley Hall has pointed out, are similarly fond of biting.

Perhaps a still more important factor is the element of combat in tumescence, since the primitive conditions associated with tumescence provide a reservoir of emotions which are constantly drawn on even in the sexual excitement of individuals belonging to civilization. The tendency to show affection by biting is, indeed, commoner among women than among men and not only in civilization. It has been noted among idiot girls as well as among the women of various savage races. It may thus be that the conservative instincts of women have preserved a primitive tendency that at its origin marked the male more than the female. But in any case the

tendency to bite at the climax of sexual excitement is so common and widespread that it must be regarded, when occurring in women, as coming within the normal range of variation in such manifestations. The gradations are of wide extent; while in its slight forms it is more or less normal and is one of the origins of the kiss,[78] in its extreme forms it tends to become one of the most violent and antisocial of sexual aberrations.

A correspondent writes regarding his experience of biting and being bitten: "I have often felt inclination to bite a woman I love, even when not in coitus or even excited. (I like doing so also with my little boy, playfully, as a cat and kittens.) There seem to be several reasons for this: (1) the muscular effect relieves me; (2) I imagine I am giving the woman pleasure; (3) I seem to attain to a more intimate possession of the loved one. I cannot remember when I first felt desire to be bitten in coitus, or whether the idea was first suggested to me. I was initiated into pinching by a French prostitute who once pinched my nates in coitus, no doubt as a matter of business; it heightened my pleasure, perhaps by stimulating muscular movement. It does not occur to me to ask to be pinched when I am very much excited already, but only at an earlier stage, no doubt with the object of promoting excitement. Apart altogether from sexual excitement, being pinched is unpleasant to me. It has not seemed to me that women usually like to be bitten. One or two women have bitten and sucked my flesh. (The latter does not affect me.) I like being bitten, partly for the same reason as I like being pinched, because if spontaneous it is a sign of my partner's amorousness and the biting never seems too hard. Women do not usually seem to like being bitten, though there are exceptions; 'I should like to bite you and I should like you to bite me,' said one woman; I did so hard, in coitus, and she did not flinch." "She is particularly anxious to eat me alive," another correspondent writes, "and nothing gives her greater satisfaction than to tear open my clothes and fasten her teeth into my flesh until I yell for mercy. My experience has generally been, however," the same correspondent continues, "that the cruelty is unconscious. A woman just grows mad with the desire to squeeze or bite something, with a complete unconsciousness of what result it will produce in the victim. She is astonished when she sees the result and will hardly believe she has done it." It is unnecessary to accumulate evidence of a tendency which is sufficiently common to

be fairly well known, but one or two quotations may be presented to show its wide distribution. In the Kama Sutra we read: "If she is very exalted, and if in the exaltation of her passionate transports she begins a sort of combat, then she takes her lover by the hair, draws his head to hers, kisses his lower lip, and then in her delirium bites him all over his body, shutting her eyes"; it is added that with the marks of such bites lovers can remind each other of their affections, and that such love will last for ages. In Japan the maiden of Aino race feels the same impulse. A.H. Savage Landor (Alone with the Hairy Aino, 1893, p. 140) says of an Aino girl: "Loving and biting went together with her. She could not do the one without the other. As we sat on a stone in the twilight she began by gently biting my fingers without hurting me, as affectionate dogs do to their masters. She then bit my arm, then my shoulder, and when she had worked herself up into a passion she put her arms around my neck and bit my cheeks. It was undoubtedly a curious way of making love, and, when I had been bitten all over, and was pretty tired of the new sensation, we retired to our respective homes. Kissing, apparently, was an unknown art to her."

The significance of biting, and the close relationship which, as will have to be pointed out later, it reveals to other phenomena, may be illustrated by some observations which have been made by Alonzi on the peasant women of Sicily. "The women of the people," he remarks, "especially in the districts where crimes of blood are prevalent, give vent to their affection for their little ones by kissing and sucking them on the neck and arms till they make them cry convulsively; all the while they say: 'How sweet you are! I will bite you, I will gnaw you all over,' exhibiting every appearance of great pleasure. If a child commits some slight fault they do not resort to simple blows, but pursue it through the street and bite it on the face, ears, and arms until the blood flows. At such moments the face of even a beautiful woman is transformed, with injected eyes, gnashing teeth, and convulsive tremors. Among both men and women a very common threat is 'I will drink your blood.' It is told on ocular evidence that a man who had murdered another in a quarrel licked the hot blood from the victim's hand." (G. Alonzi, Archivio di Psichiatria, vol. vi, fasc. 4.) A few years ago a nurse girl in New York was sentenced to prison for cruelty to the baby in her charge. The mother had frequently noticed that the child was in pain and at

last discovered the marks of teeth on its legs. The girl admitted that she had bitten the child because that action gave her intense pleasure. (*_Alienist and Neurologist_*, August, 1901, p. 558.) In the light of such observations as these we may understand a morbid perversion of affection such as was recorded in the London police news some years ago (1894). A man of 30 was charged with ill-treating his wife's illegitimate daughter, aged 3, during a period of many months; her lips, eyes, and hands were bitten and bruised from sucking, and sometimes her pinafore was covered with blood. "Defendant admitted he had bitten the child because he loved it."

It is not surprising that such phenomena as these should sometimes be the stimulant and accompaniment to the sexual act. Ferriani thus reports such a case in the words of the young man's mistress: "Certainly he is a strange, maddish youth, though he is fond of me and spends money on me when he has any. He likes much sexual intercourse, but, to tell the truth, he has worn out my patience, for before our embraces there are always struggles which become assaults. He tells me he has no pleasure except when he sees me crying on account of his bites and vigorous pinching. Lately, just before going with me, when I was groaning with pleasure, he threw himself on me and at the moment of emission furiously bit my right cheek till the blood came. Then he kissed me and begged my pardon, but would do it again if the wish took him." (L. Ferriani, *_Archivio di Psicopatologia Sessuale_*, vol. i, fasc. 7 and 8, 1896, p. 107.)

In morbid cases biting may even become a substitute for coitus. Thus, Moll (*_Die Konträre Sexualempfindung_*, second edition, p. 323) records the case of a hysterical woman who was sexually anesthetic, though she greatly loved her husband. It was her chief delight to bite him till the blood flowed, and she was content if, instead of coitus, he bit her and she him, though she was grieved if she inflicted much pain. In other still more morbid cases the fear of inflicting pain is more or less abolished.

An idealized view of the impulse of love to bite and devour is presented in the following passage from a letter by a lady who associates this impulse with the idea of the Last Supper: "Your remarks about the Lord's Supper in 'Whitman' make it natural to

me to tell you my thoughts about that 'central sacrament of Christianity.' I cannot tell many people because they misunderstand, and a clergyman, a very great friend of mine, when I once told what I thought and felt, said I was carnal. He did not understand the divinity and intensity of human love as I understand it. Well, when one loves anyone very much,--a child, a woman, or a man,--one loves everything belonging to him: the things he wears, still more his hands, and his face, every bit of his body. We always want to have all, or part, of him as part of ourselves. Hence the expression: I could _devour_ you, I love you so. In some such warm, devouring way Jesus Christ, I have always felt, loved each and every human creature. So it was that he took this mystery of food, which by eating became part of ourselves, as the symbol of the most intense human love, the most intense Divine love. Some day, perhaps, love will be so understood by all that this sacrament will cease to be a superstition, a bone of contention, an 'article' of the church, and become, in all simplicity, a symbol of pure love."

While in men it is possible to trace a tendency to inflict pain, or the simulacrum of pain, on the women they love, it is still easier to trace in women a delight in experiencing physical pain when inflicted by a lover, and an eagerness to accept subjection to his will. Such a tendency is certainly normal. To abandon herself to her lover, to be able to rely on his physical strength and mental resourcefulness, to be swept out of herself and beyond the control of her own will, to drift idly in delicious submission to another and stronger will--this is one of the commonest aspirations in a young woman's intimate love-dreams. In our own age these aspirations most often only find their expression in such dreams. In ages when life was more nakedly lived, and emotion more openly expressed, it was easier to trace this impulse. In the thirteenth century we have found Marie de France--a French poetess living in England who has been credited with "an exquisite sense of the generosities and delicacy of the heart," and whose work was certainly highly appreciated in the best circles and among the most cultivated class of her day--describing as a perfect, wise, and courteous knight a man who practically commits a rape on a woman who has refused to have anything to do with him, and, in so acting, he wins her entire love. The savage beauty of New Caledonia furnishes no better illustration of the fascination of force, for she, at all events, has done her best to court the violence she undergoes. In Middleton's _Spanish Gypsy_ we find exactly the same episode, and the unhappy Portuguese nun wrote: "Love me for ever and make me suffer still more." To find in

literature more attenuated examples of the same tendency is easy. Shakespeare, whose observation so little escaped, has seldom depicted the adult passion of a grown woman, but in the play which he has mainly devoted to this subject he makes Cleopatra refer to "amorous pinches," and she says in the end: "The stroke of death is as a lover's pinch, which hurts and is desired." "I think the Sabine woman enjoyed being carried off like that," a woman remarked in front of Rubens's "Rape of the Sabines," confessing that such a method of love-making appealed strongly to herself, and it is probable that the majority of women would be prepared to echo that remark.

It may be argued that pain cannot give pleasure, and that when what would usually be pain is felt as pleasure it cannot be regarded as pain at all. It must be admitted that the emotional state is often somewhat complex. Moreover, women by no means always agree in the statement of their experience. It is noteworthy, however, that even when the pleasurable of pain in love is denied it is still admitted that, under some circumstances, pain, or the idea of pain, is felt as pleasurable. I am indebted to a lady for a somewhat elaborate discussion of this subject, which I may here quote at length: "As regards physical pain, though the idea of it is sometimes exciting, I think the reality is the reverse. A very slight amount of pain destroys my pleasure completely. This was the case with me for fully a month after marriage, and since. When pain has occasionally been associated with passion, pleasure has been sensibly diminished. I can imagine that, when there is a want of sensitiveness so that the tender kiss or caress might fail to give pleasure, more forcible methods are desired; but in that case what would be pain to a sensitive person would be only a pleasant excitement, and it could not be truly said that such obtuse persons liked pain, though they might appear to do so. I cannot think that anyone enjoys what is pain _to them_, if only from the fact that it detracts and divides the attention. This, however, is only my own idea drawn from my own negative experience. No woman has ever told me that she would like to have pain inflicted on her. On the other hand, the desire to inflict pain seems almost universal among men. I have only met one man in whom I have never at any time been able to detect it. At the same time most men shrink from putting their ideas into practice. A friend of my husband finds his chief pleasure in imagining women hurt and ill-treated, but is too tender-hearted ever to inflict

pain on them in reality, even when they are willing to submit to it. Perhaps a woman's readiness to submit to pain to please a man may sometimes be taken for pleasure in it. Even when women like the idea of pain, I fancy it is only because it implies subjection to the man, from association with the fact that physical pleasure must necessarily be preceded by submission to his will."

In a subsequent communication this lady enlarged and perhaps somewhat modified her statements on this point:--

"I don't think that what I said to you was quite correct. Actual pain gives me no pleasure, yet the idea of pain does, if inflicted by way of discipline and for the ultimate good of the person suffering it. This is essential. For instance, I once read a poem in which the devil and the lost souls in hell were represented as recognizing that they could not be good except under torture, but that while suffering the purifying actions of the flames of hell they so realized the beauty of holiness that they submitted willingly to their agony and praised God for the sternness of his judgment. This poem gave me decided physical pleasure, yet I know that if my hand were held in a fire for five minutes I should feel nothing but the pain of the burning. To get the feeling of pleasure, too, I must, for the moment, revert to my old religious beliefs and my old notion that mere suffering has an elevating influence; one's emotions are greatly modified by one's beliefs. When I was about fifteen I invented a game which I played with a younger sister, in which we were supposed to be going through a process of discipline and preparation for heaven after death. Each person was supposed to enter this state on dying and to pass successively into the charge of different angels named after the special virtues it was their function to instill. The last angel was that of Love, who governed solely by the quality whose name he bore. In the lower stages, we were under an angel called Severity who prepared us by extreme harshness and by exacting implicit obedience to arbitrary orders for the acquirement of later virtues. Our duties were to superintend the weather, paint the sunrise and sunset, etc., the constant work involved exercising us in patience and submission. The physical pleasure came in in inventing and recounting to each other our day's work and the penalties and hardships we had been subjected to. We never told each other that we got any physical

pleasure out of this, and I cannot therefore be sure that my sister did so; I only imagine she did because she entered so heartily into the spirit of the game. I could get as much pleasure by imagining myself the angel and inflicting the pain, under the conditions mentioned; but my sister did not like this so much, as she then had no companion in subjection. I could not, however, thus reverse my feelings in regard to a man, as it would appear to me unnatural, and, besides, the greater physical strength is essential in the superior position. I can, however, by imagining myself a man, sometimes get pleasure in conceiving myself as educating and disciplining a woman by severe measures. There is, however, no real cruelty in this idea, as I always imagine her liking it.

"I only get pleasure in the idea of a woman submitting herself to pain and harshness from the man she loves when the following conditions are fulfilled: 1. She must be absolutely sure of the man's love. 2. She must have perfect confidence in his judgment. 3. The pain must be deliberately inflicted, not accidental. 4. It must be inflicted in kindness and for her own improvement, not in anger or with any revengeful feelings, as that would spoil one's ideal of the man. 5. The pain must not be excessive and must be what when we were children we used to call a 'tidy' pain; i.e., there must be no mutilation, cutting, etc. 6. Last, one would have to feel very sure of one's own influence over the man. So much for the idea. As I have never suffered pain under a combination of all these conditions, I have no right to say that I should or should not experience pleasure from its infliction in reality."

Another lady writes: "I quite agree that the idea of pain may be pleasurable, but must be associated with something to be gained by it. My experience is that it [coitus] does often hurt for a few moments, but that passes and the rest is easy; so that the little hurt is nothing terrible, but all the same annoying if only for the sake of a few minutes' pleasure, which is not long enough. I do not know how my experience compares with other women's, but I feel sure that in my case the time needed is longer than usual, and the longer the better, always, with me. As to liking pain--no, I do not really like it, although I can tolerate pain very well, of any kind; but I like to feel force and strength; this is usual, I think, women being--or supposed to

be--passive in love. I have not found that 'pain at once kills pleasure.' "

Again, another lady briefly states that, for her, pain has a mental fascination, and that such pain as she has had she has liked, but that, if it had been any stronger, pleasure would have been destroyed.

The evidence thus seems to point, with various shades of gradation, to the conclusion that the idea or even the reality of pain in sexual emotion is welcomed by women, provided that this element of pain is of small amount and subordinate to the pleasure which is to follow it. Unless coitus is fundamentally pleasure the element of pain must necessarily be unmitigated pain, and a craving for pain unassociated with a greater satisfaction to follow it cannot be regarded as normal.

In this connection I may refer to a suggestive chapter on "The Enjoyment of Pain" in Hirn's *_Origins of Art_*. "If we take into account," says Hirn, "the powerful stimulating effect which is produced by acute pain, we may easily understand why people submit to momentary unpleasantness for the sake of enjoying the subsequent excitement. This motive leads to the deliberate creation, not only of pain-sensations, but also of emotions in which pain enters as an element. The violent activity which is involved in the reaction against fear, and still more in that against anger, affords us a sensation of pleasurable excitement which is well worth the cost of the passing unpleasantness. It is, moreover, notorious that some persons have developed a peculiar art of making the initial pain of anger so transient that they can enjoy the active elements in it with almost undivided delight. Such an accomplishment is far more difficult in the case of sorrow.... The creation of pain-sensations may be explained as a desperate device for enhancing the intensity of the emotional state."

The relation of pain and pleasure to emotion has been thoroughly discussed, I may add, by H.R. Marshall in his *_Pain, Pleasure, and Aesthetics_*. He contends that pleasure and pain are "general qualities, one of which must, and either of which may, belong to any fixed element of consciousness." "Pleasure," he considers, "is experienced whenever the physical activity coincident with

the psychic state to which the pleasure is attached involves the use of surplus stored force." We can see, therefore, how, if pain acts as a stimulant to emotion, it becomes the servant of pleasure by supplying it with surplus stored force.

This problem of pain is thus one of psychic dynamics. If we realize this we shall begin to understand the place of cruelty in life. "One ought to learn anew about cruelty," said Nietzsche (*Beyond Good and Evil*, 229), "and open one's eyes. Almost everything that we call 'higher culture' is based upon the spiritualizing and intensifying of *cruelty*.... Then, to be sure, we must put aside teaching the blundering psychology of former times, which could only teach with regard to cruelty that it originated at the sight of the suffering of *others*; there is an abundant, superabundant enjoyment even in one's own suffering, in causing one's own suffering." The element of paradox disappears from this statement if we realize that it is not a question of "cruelty," but of the dynamics of pain.

Camille Bos in a suggestive essay ("*Du Plaisir de la Douleur*," *Revue Philosophique*, July, 1902) finds the explanation of the mystery in that complexity of the phenomena to which I have already referred. Both pain and pleasure are complex feelings, the resultant of various components, and we name that resultant in accordance with the nature of the strongest component. "Thus we give to a complexus a name which strictly belongs only to one of its factors, *and in pain all is not painful*." When pain becomes a desired end Camille Bos regards the desire as due to three causes: (1) the pain contrasts with and revives a pleasure which custom threatens to dull; (2) the pain by preceding the pleasure accentuates the positive character of the latter; (3) pain momentarily raises the lowered level of sensibility and restores to the organism for a brief period the faculty of enjoyment it had lost.

It must therefore be said that, in so far as pain is pleasurable, it is so only in so far as it is recognized as a prelude to pleasure, or else when it is an actual stimulus to the nerves conveying the sensation of pleasure. The nymphomaniac who experienced an orgasm at the moment when the knife passed through her clitoris (as recorded by Mantegazza) and the prostitute who experienced keen pleasure when the surgeon removed vegetations

from her vulva (as recorded by Féré) took no pleasure in pain, but in one case the intense craving for strong sexual emotion, and in the other the long-blunted nerves of pleasure, welcomed the abnormally strong impulse; and the pain of the incision, if felt at all, was immediately swallowed up in the sensation of pleasure. Moll remarks (*Konträre Sexualempfindung*, third edition, p. 278) that even in man a trace of physical pain may be normally combined with sexual pleasure, when the vagina contracts on the penis at the moment of ejaculation, the pain, when not too severe, being almost immediately felt as pleasure. That there is no pleasure in the actual pain, even in masochism, is indicated by the following statement which Krafft-Ebing gives as representing the experiences of a masochist (*Psychopathia Sexualis*, English translation, p. 201): "The relation is not of such a nature that what causes physical pain is simply perceived as physical pleasure, for the person in a state of masochistic ecstasy feels no pain, either because by reason of his emotional state (like that of the soldier in battle) the physical effect on his cutaneous nerves is not apperceived, or because (as with religious martyrs and enthusiasts) in the preoccupation of consciousness with sexual emotion the idea of maltreatment remains merely a symbol, without its quality of pain. To a certain extent there is overcompensation of physical pain in psychic pleasure, and only the excess remains in consciousness as psychic lust. This also undergoes an increase, since, either through reflex spinal influence or through a peculiar coloring in the sensorium of sensory impressions, a kind of hallucination of bodily pleasure takes place, with a vague localization of the objectively projected sensation. In the self-torture of religious enthusiasts (fakirs, howling dervishes, religious flagellants) there is an analogous state, only with a difference in the quality of pleasurable feeling. Here the conception of martyrdom is also apperceived without its pain, for consciousness is filled with the pleasurable colored idea of serving God, atoning for sins, deserving Heaven, etc., through martyrdom." This statement cannot be said to clear up the matter entirely; but it is fairly evident that, when a woman says that she finds pleasure in the pain inflicted by a lover, she means that under the special circumstances she finds pleasure in treatment which would at other times be felt as pain, or else that the slight real pain experienced is so quickly followed by overwhelming pleasure that in memory the pain itself seems to have been pleasure and may

even be regarded as the symbol of pleasure.

There is a special peculiarity of physical pain, which may be well borne in mind in considering the phenomena now before us, for it helps to account for the tolerance with which the idea of pain is regarded. I refer to the great ease with which physical pain is forgotten, a fact well known to all mothers, or to all who have been present at the birth of a child. As Professor von Tschisch points out ("Der Schmerz," *Zeitschrift für Psychologie und Physiologie der Sinnesorgane*, Bd. xxvi, ht. 1 and 2, 1901), memory can only preserve impressions as a whole; physical pain consists of a sensation and of a feeling. But memory cannot easily reproduce the definite sensation of the pain, and thus the whole memory is disintegrated and speedily forgotten. It is quite otherwise with moral suffering, which persists in memory and has far more influence on conduct. No one wishes to suffer moral pain or has any pleasure even in the idea of suffering it.

It is the presence of this essential tendency which leads to a certain apparent contradiction in a woman's emotions. On the one hand, rooted in the maternal instinct, we find pity, tenderness, and compassion; on the other hand, rooted in the sexual instinct, we find a delight in roughness, violence, pain, and danger, sometimes in herself, sometimes also in others. The one impulse craves something innocent and helpless, to cherish and protect; the other delights in the spectacle of recklessness, audacity, sometimes even effrontery.[79] A woman is not perfectly happy in her lover unless he can give at least some satisfaction to each of these two opposite longings.

The psychological satisfaction which women tend to feel in a certain degree of pain in love is strictly co-ordinated with a physical fact. Women possess a minor degree of sensibility in the sexual region. This fact must not be misunderstood. On the one hand, it by no means begs the question as to whether women's sensibility generally is greater or less than that of men; this is a disputed question and the evidence is still somewhat conflicting.[80] On the other hand, it also by no means involves a less degree of specific sexual pleasure in women, for the tactile sensibility of the sexual organs is no index to the specific sexual sensibility of those organs when in a state of tumescence. The real significance of the less tactile sensibility of the genital region in women is to be found in parturition and the special liability of the sexual region in women to injury.[81] The women who are less sensitive in

this respect would be better able and more willing to endure the risks of childbirth, and would therefore tend to supplant those who were more sensitive. But, as a by-product of this less degree of sensibility, we have a condition in which physical irritation amounting even to pain may become to normal women in the state of extreme tumescence a source of pleasurable excitement, such as it would rarely be to normal men.

To Calmann appear to be due the first carefully made observations showing the minor sensibility of the genital tract in women. (Adolf Calmann, "Sensibilitätsprüfungen am weiblichen Genitale nach forensischen Gesichtspunkten," *_Archiv für Gynäkologie_*, 1898, p. 454.) He investigated the vagina, urethra, and anus in eighteen women and found a great lack of sensibility, least marked in anus, and most marked in vagina. [This distribution of the insensitiveness alone indicates that it is due, as I have suggested, to natural selection.] Sometimes a finger in the vagina could not be felt at all. One woman, when a catheter was introduced into the anus, said it might be the vagina or urethra, but was certainly not the anus. (Calmann remarks that he was careful to put his questions in an intelligible form.) The women were only conscious of the urine being drawn off when they heard the familiar sound of the stream or when the bladder was very full; if the sound of the stream was deadened by a towel they were quite unconscious that the bladder had been emptied. [In confirmation of this statement I have noticed that in a lady whose distended bladder it was necessary to empty by the catheter shortly before the birth of her first child--but who had, indeed, been partly under the influence of chloroform--there was no consciousness of the artificial relief; she merely remarked that she thought she could now relieve herself.] There was some sense of temperature, but sense of locality, tactile sense, and judgment of size were often widely erroneous. It is significant that virgins were just as insensitive as married women or those who had had children. Calmann's experiments appear to be confirmed by the experiments of Marco Treves, of Turin, on the thermoesthesiometry of mucous membranes, as reported to the Turin International Congress of Physiology (and briefly noted in *_Nature_*, November 21, 1901). Treves found that the sensitivity of mucous membranes is always less than that of the skin. The mucosa of the urethra and of the cervix uteri was quite incapable of heat and cold sensations, and even the cautery excited only slight, and that painful, sensation.

In further illustration of this point reference may be made to the not infrequent cases in which the whole process of parturition and the enormous distention of tissues which it involves proceed throughout in an almost or quite painless manner. It is sufficient to refer to two cases reported in Paris by Macé and briefly summarized in the British Medical Journal, May 25, 1901. In the first the patient was a primipara 20 years of age, and, until the dilatation of the cervix was complete and efforts at expulsion had commenced, the uterine contractions were quite painless. In the second case, the mother, aged 25, a tripara, had previously had very rapid labors; she awoke in the middle of the night without pains, but during micturition the fetal head appeared at the vulva, and was soon born.

Further illustration may be found in those cases in which severe inflammatory processes may take place in the genital canal without being noticed. Thus, Maxwell reports the case of a young Chinese woman, certainly quite normal, in whom after the birth of her first child the vagina became almost obliterated, yet beyond slight occasional pain she noticed nothing wrong until the husband found that penetration was impossible (British Medical Journal, January 11, 1902, p. 78). The insensitiveness of the vagina and its contrast, in this respect, with the penis--though we are justified in regarding the penis as being, like organs of special sense, relatively deficient in general sensibility--are vividly presented in such an incident as the following, reported a few years ago in America by Dr. G.W. Allen in the Boston Medical and Surgical Journal: A man came under observation with an edematous, inflamed penis. The wife, the night previous, on advice of friends, had injected pure carbolic acid into the vagina just previous to coitus. The husband, ignorant of the fact, experienced untoward burning and smarting during and after coitus, but thought little of it, and soon fell asleep. The next morning there were large blisters on the penis, but it was no longer painful. When seen by Dr. Allen the prepuce was retracted and edematous, the whole penis was much swollen, and there were large, perfectly raw surfaces on either side of the glans.

In this connection we may well bring into line a remarkable group of phenomena concerning which much evidence has now accumulated. I refer to the use of various appliances, fixed in or around the penis, whether

permanently or temporarily during coitus, such appliance being employed at the woman's instigation and solely in order to heighten her excitement in congress. These appliances have their great center among the Indonesian peoples (in Borneo, Java, Sumatra, the Malay peninsula, the Philippines, etc.), thence extending in a modified form through China, to become, it appears, considerably prevalent in Russia; I have also a note of their appearance in India. They have another widely diffused center, through which, however, they are more sparsely scattered, among the American Indians of the northern and more especially of the southern continents. Amerigo Vespucci and other early travelers noted the existence of some of these appliances, and since Miklucho-Macleay carefully described them as used in Borneo[82] their existence has been generally recognized. They are usually regarded merely as ethnological curiosities. As such they would not concern us here. Their real significance for us is that they illustrate the comparative insensitiveness of the genital canal in women, while at the same time they show that a certain amount of what we cannot but regard as painful stimulation is craved by women, in order to heighten tumescence and increase sexual pleasure, even though it can only be procured by artificial methods. It is, of course, possible to argue that in these cases we are not concerned with pain at all, but with a strong stimulation that is felt as purely pleasurable. There can be no doubt, however, that in the absence of sexual excitement this stimulation would be felt as purely painful, and--in the light of our previous discussion--we may, perhaps, fairly regard it as a painful stimulation which is craved, not because it is itself pleasurable, but because it heightens the highly pleasurable state of tumescence.

Borneo, the geographical center of the Indonesian world, appears also to be the district in which these instruments are most popular. The ampallang, palang, kambion, or sprit-sail yard, as it is variously termed, is a little rod of bone or metal nearly two inches in length, rounded at the ends, and used by the Kyans and Dyaks of Borneo. Before coitus it is inserted into a transverse orifice in the penis, made by a painful and somewhat dangerous operation and kept open by a quill. Two or more of these instruments are occasionally worn. Sometimes little brushes are attached to each end of the instrument. Another instrument, used by the Dyaks, but said to have been borrowed from the Malays, is the palang anus, which is a ring or collar of plaited palm-fiber, furnished with a pair of stiffish horns of the same wiry material; it is worn on the neck of the glans and fits tight to the skin so as not to slip off. (Brooke Low, "The

Natives of Borneo," *Journal of the Anthropological Institute*, August and November, 1892, p. 45; the *ampallang* and similar instruments are described by Ploss and Bartels, *Das Weib*, Bd. i, chapter xviii; also in *Untrodden Fields of Anthropology*, by a French army surgeon, 1898, vol. ii, pp. 135-141; also Mantegazza, *Gli Amori degli Uomini*, French translation, p. 83 et seq.) Riedel informed Miklucho-Macleay that in the Celebes the Alfurus fasten the eyelids of goats with the eyelashes round the corona of the glans penis, and in Java a piece of goatskin is used in a similar way, so as to form a hairy sheath (*Zeitschrift für Ethnologie*, 1876, pp. 22-25), while among the Batta, of Sumatra, Hagen found that small stones are inserted by an incision under the skin of the penis (*Zeitschrift für Ethnologie*, 1891, ht. 3, p. 351).

In the Malay peninsula Stevens found instruments somewhat similar to the *ampallang* still in use among some tribes, and among others formerly in use. He thinks they were brought from Borneo. (H.V. Stevens, *Zeitschrift für Ethnologie*, 1896, ht. 4, p. 181.) Bloch, who brings forward other examples of similar devices (*Beiträge zur Ätiologie der Psychopathia Sexualis*, pp. 56-58), considers that the Australian mica operation may thus in part be explained.

Such instruments are not, however, entirely unknown in Europe. In France, in the eighteenth century, it appears that rings, sometimes set with hard knobs, and called "aides," were occasionally used by men to heighten the pleasure of women in intercourse. (Dühren, *Marquis de Sade*, 1901, p. 130.) In Russia, according to Weissenberg, of Elizabethsgrad, it is not uncommon to use elastic rings set with little teeth; these rings are fastened around the base of the glans. (Weissenberg, *Zeitschrift für Ethnologie*, 1893, ht. 2, p. 135.) This instrument must have been brought to Russia from the East, for Burton (in the notes to his *Arabian Nights*) mentions a precisely similar instrument as in use in China. Somewhat similar is the "Chinese hedgehog," a wreath of fine, soft feathers with the quills solidly fastened by silver wire to a ring of the same metal, which is slipped over the glans. In South America the Araucanians of Argentina use a little horsehair brush fastened around the penis; one of these is in the museum at La Plata; it is said the custom may have been borrowed from the Patagonians;

these instruments, called *_geskels_*, are made by the women and the workmanship is very delicate. (Lehmann-Nitsche, *_Zeitschrift für Ethnologie_*, 1900, ht. 6, p. 491.) It is noteworthy that a somewhat similar tuft of horsehair is also worn in Borneo. (Breitenstein, *_21 Jahre in India_*, 1899, pt. i, p. 227.) Most of the accounts state that the women attach great importance to the gratification afforded by such instruments. In Borneo a modest woman symbolically indicates to her lover the exact length of the ampallang she would prefer by leaving at a particular spot a cigarette of that length. Miklucho-Macleay considers that these instruments were invented by women. Brooke Low remarks that "no woman once habituated to its use will ever dream of permitting her bedfellow to discontinue the practice of wearing it," and Stevens states that at one time no woman would marry a man who was not furnished with such an apparatus. It may be added that a very similar appliance may be found in European countries (especially Germany) in the use of a condom furnished with irregularities, or a frill, in order to increase the woman's excitement. It is not impossible to find evidence that, in European countries, even in the absence of such instruments, the craving which they gratify still exists in women. Thus, Mauriac tells of a patient with vegetations on the glans who delayed treatment because his mistress liked him so best (art. "Végétations," *_Dictionnaire de Médecine et Chirurgie pratique_*).

It may seem that such impulses and such devices to gratify them are altogether unnatural. This is not so. They have a zoölogical basis and in many animals are embodied in the anatomical structure. Many rodents, ruminants, and some of the carnivora show natural developments of the penis closely resembling some of those artificially adopted by man. Thus the guinea-pigs possess two horny styles attached to the penis, while the glans of the penis is covered with sharp spines. Some of the Caviidæ also have two sharp, horny saws at the side of the penis. The cat, the rhinoceros, the tapir, and other animals possess projecting structures on the penis, and some species of ruminants, such as the sheep, the giraffe, and many antelopes, have, attached to the penis, long filiform processes through which the urethra passes. (F.H.A. Marshall, *_The Physiology of Reproduction_*, pp. 246-248.)

We find, even in creatures so delicate and ethereal as the butterflies, a whole armory of keen weapons for use in coitus.

These were described in detail in an elaborate and fully illustrated memoir by P.H. Gosse ("On the Clasping Organs Ancillary to Generation in Certain Groups of the Lepidoptera," Transactions of the Linnaean Society, second series, vol. ii, Zoölogy, 1882). These organs, which Gosse terms harpes (or grappling irons), are found in the Papilionidæ and are very beautiful and varied, taking the forms of projecting claws, hooks, pikes, swords, knobs, and strange combinations of these, commonly brought to a keen edge and then cut into sharp teeth.

It is probable that all these structures serve to excite the sexual apparatus of the female and to promote tumescence.

To the careless observer there may seem to be something vicious or perverted in such manifestations in man. That opinion becomes very doubtful when we consider how these tendencies occur in people living under natural conditions in widely separated parts of the world. It becomes still further untenable if we are justified in believing that the ancestors of men possessed projecting epithelial appendages attached to the penis, and if we accept the discovery by Friedenthal of the rudiment of these appendages on the penis of the human fetus at an early stage (Friedenthal, "Sonderformen der menschlichen Leibesbildung," Sexual-Probleme, Feb., 1912, p. 129). In this case human ingenuity would merely be seeking to supply an organ which nature has ceased to furnish, although it is still in some cases needed, especially among peoples whose aptitude for erethism has remained at, or fallen to, a subhuman level.

At first sight the connection between love and pain--the tendency of men to delight in inflicting it and women in suffering it--seems strange and inexplicable. It seems amazing that a tender and even independent woman should maintain a passionate attachment to a man who subjects her to physical and moral insults, and that a strong man, often intelligent, reasonable, and even kind-hearted, should desire to subject to such insults a woman whom he loves passionately and who has given him every final proof of her own passion. In understanding such cases we have to remember that it is only within limits that a woman really enjoys the pain, discomfort, or subjection to which she submits. A little pain which the man knows he can himself soothe, a little pain which the woman gladly accepts as the sign and forerunner of pleasure--this degree of pain comes within the normal limits of love and is rooted, as we have seen, in the

experience of the race. But when it is carried beyond these limits, though it may still be tolerated because of the support it receives from its biological basis, it is no longer enjoyed. The natural note has been too violently struck, and the rhythm of love has ceased to be perfect. A woman may desire to be forced, to be roughly forced, to be ravished away beyond her own will. But all the time she only desires to be forced toward those things which are essentially and profoundly agreeable to her. A man who fails to realize this has made little progress in the art of love. "I like being knocked about and made to do things I don't want to do," a woman said, but she admitted, on being questioned, that she would not like to have much pain inflicted, and that she might not care to be made to do important things she did not want to do. The story of Griselda's unbounded submissiveness can scarcely be said to be psychologically right, though it has its artistic rightness as an elaborate fantasia on this theme justified by its conclusion.

This point is further illustrated by the following passage from a letter written by a lady: "Submission to the man's will is still, and always must be, the prelude to pleasure, and the association of ideas will probably always produce this much misunderstood instinct. Now, I find, indirectly from other women and directly from my own experience, that, when the point in dispute is very important and the man exerts his authority, the desire to get one's own way completely obliterates the sexual feeling, while, conversely, in small things the sexual feeling obliterates the desire to have one's own way. Where the two are nearly equal a conflict between them ensues, and I can stand aside and wonder which will get the best of it, though I encourage the sexual feeling when possible, as, if the other conquers, it leaves a sense of great mental irritation and physical discomfort. A man should command in small things, as in nine cases out of ten this will produce excitement. He should advise in large matters, or he may find either that he is unable to enforce his orders or that he produces a feeling of dislike and annoyance he was far from intending. Women imagine men must be stronger than themselves to excite their passion. I disagree. A passionate man has the best chance, for in him the primitive instincts are strong. The wish to subdue the female is one of them, and in small things he will exert his authority to make her feel his power, while she knows that on a question of real importance she has a good chance of getting her own way by working on his greater susceptibility. Perhaps an illustration will show what I

mean. I was listening to the band and a girl and her _fiancé_ came up to occupy two seats near me. The girl sank into one seat, but for some reason the man wished her to take the other. She refused. He repeated his order twice, the second time so peremptorily that she changed places, and I heard him say: 'I don't think you heard what I said. I don't expect to give an order three times.'

"This little scene interested me, and I afterward asked the girl the following questions:--

" 'Had you any reason for taking one chair more than the other?'

" 'No. '

" 'Did Mr. ----'s insistence on your changing give you any pleasure?'

" 'Yes' (after a little hesitation).

" 'Why?'

" 'I don't know. '

" 'Would it have done so if you had particularly wished to sit in that chair; if, for instance, you had had a boil on your cheek and wished to turn that side away from him?'

" 'No; certainly not. The worry of thinking he was looking at it would have made me too cross to feel pleased.'

"Does this explain what I mean? The occasion, by the way, need not be really important, but, as in this imaginary case of the boil, if it _seems important_ to the woman, irritation will outweigh the physical sensation."

I am well aware that in thus asserting a certain tendency in women to delight in suffering pain--however careful and qualified the position I have taken--many estimable people will cry out that I am degrading a whole sex and generally supporting the "subjection of women." But the day for academic discussion concerning the "subjection of women" has gone by. The tendency I have sought to make clear is too well established by the

experience of normal and typical women--however numerous the exceptions may be--to be called in question. I would point out to those who would deprecate the influence of such facts in relation to social progress that nothing is gained by regarding women as simply men of smaller growth. They are not so; they have the laws of their own nature; their development must be along their own lines, and not along masculine lines. It is as true now as in Bacon's day that we only learn to command nature by obeying her. To ignore facts is to court disappointment in our measure of progress. The particular fact with which we have here come in contact is very vital and radical, and most subtle in its influence. It is foolish to ignore it; we must allow for its existence. We can neither attain a sane view of life nor a sane social legislation of life unless we possess a just and accurate knowledge of the fundamental instincts upon which life is built.

FOOTNOTES:

[61] Various mammals, carried away by the reckless fury of the sexual impulse, are apt to ill-treat their females (R. Müller, *_Sexualbiologie_*, p. 123). This treatment is, however, usually only an incident of courtship, the result of excess of ardor. "The chaffinches and saffron-finches (*_Fringella_* and *_Sycalis_*) are very rough wooers," says A.G. Butler (*_Zoölogist_*, 1902, p. 241); "they sing vociferously, and chase their hens violently, knocking them over in their flight, pursuing and savagely pecking them even on the ground; but when once the hens become submissive, the males change their tactics, and become for the time model husbands, feeding their wives from their crop, and assisting in rearing the young."

[62] Cf. A.C. Haddon, *_Head Hunters_*, p. 107.

[63] Marro considers that there may be transference of emotion,--the impulse of violence generated in the male by his rivals being turned against his partner,--according to a tendency noted by Sully and illustrated by Ribot in his *_Psychology of the Emotions_*, part i, chapter xii.

[64] Several writers have found in the facts of primitive animal courtship the explanation of the connection between love and pain. Thus, Krafft-Ebing (*_Psychopathia Sexualis_*, English translation of tenth German edition, p. 80) briefly notes that outbreaks of sadism are possibly atavistic. Marro (*_La Pubertà_*, 1898, p. 219 et seq.) has some suggestive

pages on this subject. It would appear that this explanation was vaguely outlined by Jäger. Laserre, in a Bordeaux thesis mentioned by Féré, has argued in the same sense. Féré (*L'Instinct Sexuel*, p. 134), on grounds that are scarcely sufficient, regards this explanation as merely a superficial analogy. But it is certainly not a complete explanation.

[65] Schäfer (*Jahrbücher für Psychologie*, Bd. ii, p. 128, and quoted by Krafft-Ebing in *Psychopathia Sexualis*), in connection with a case in which sexual excitement was produced by the sight of battles or of paintings of them, remarks: "The pleasure of battle and murder is so predominantly an attribute of the male sex throughout the animal kingdom that there can be no question about the close connection between this side of the masculine character and male sexuality. I believe that I can show by observation that in men who are absolutely normal, mentally and physically, the first indefinite and incomprehensible precursors of sexual excitement may be induced by reading exciting scenes of chase and war. These give rise to unconscious longings for a kind of satisfaction in warlike games (wrestling, etc.) which express the fundamental sexual impulse to close and complete contact with a companion, with a secondary more or less clearly defined thought of conquest." Groos (*Spiele der Menschen*, 1899, p. 232) also thinks there is more or less truth in this suggestion of a subconscious sexual element in the playful wrestling combats of boys. Freud considers (*Drei Abhandlungen zur Sexualtheorie*, p. 49) that the tendency to sexual excitement through muscular activity in wrestling, etc., is one of the roots of sadism. I have been told of normal men who feel a conscious pleasure of this kind when lifted in games, as may happen, for instance, in football. It may be added that in some parts of the world the suitor has to throw the girl in a wrestling-bout in order to secure her hand.

[66] A minor manifestation of this tendency, appearing even in quite normal and well-conditioned individuals, is the impulse among boys at and after puberty to take pleasure in persecuting and hurting lower animals or their own young companions. Some youths display a diabolical enjoyment and ingenuity in torturing sensitive juniors, and even a boy who is otherwise kindly and considerate may find enjoyment in deliberately mutilating a frog. In some cases, in boys and youths who have no true sadistic impulse and are not usually cruel, this infliction of torture on a lower animal produces an erection, though not necessarily any pleasant sexual sensations.

Juvenile," *_Comptes-rendus Congrès Internationale d'Anthropologie Criminelle_*, Amsterdam, 1901, p. 296; *_Archivio di Psichiatria_*, 1899, fasc. v-vi, p. 572.

[68] Bk. ii, ch. ii.

[69] Herbert Spencer, *_Principles of Sociology_*, 1876, vol. i, p. 651.

[70] Westermarck, *_Human Marriage_*, p. 388. Grosse is of the same opinion; he considers also that the mock-capture is often an imitation, due to admiration, of real capture; he does not believe that the latter has ever been a form of marriage recognized by custom and law, but only "an occasional and punishable act of violence." (*_Die Formen der Familie_*, pp. 105-7.) This position is too extreme.

[71] Ernest Crawley, *_The Mystic Rose_*, 1902, p. 350 et seq. Van Gennep rightly remarks that we cannot correctly say that the woman is abducted from "her sex," but only from her "sexual society."

[72] A. Van Gennep (*_Rites de Passage_*, 1909, pp. 175-186) has put forward a third theory, though also of a psychological character, according to which the "capture" is a rite indicating the separation of the young girl from the special societies of her childhood. Gennep regards this rite as one of a vast group of "rites of passage," which come into action whenever a person changes his social or natural environment.

[73] Féré (*_L'Instinct Sexuel_*, p. 133) appears to regard the satisfaction, based on the sentiment of personal power, which may be experienced in the suffering and subjection of a victim as an adequate explanation of the association of pain with love. This I can scarcely admit. It is a factor in the emotional attitude, but when it only exists in the sexual sphere it is reasonable to base this attitude largely on the still more fundamental biological attitude of the male toward the female in the process of courtship. Féré regards this biological element as merely a superficial analogy, on the ground that an act of cruelty may become an equivalent of coitus. But a sexual perversion is quite commonly constituted by the selection and magnification of a single moment in the normal sexual process.

[74] The process may, however, be quite conscious. Thus, a correspondent tells me that he not only finds sexual pleasure in cruelty toward the woman he loves, but that he regards this as an essential element. He is

convinced that it gives the woman pleasure, and that it is possible to distinguish by gesture, inflection of voice, etc., an hysterical, assumed, or imagined feeling of pain from real pain. He would not wish to give real pain, and would regard that as sadism.

[75] De Sade had already made the same remark, while Duchenne, of Boulogne, pointed out that the facial expressions of sexual passion and of cruelty are similar.

[78] See in vol. iv of these *Studies* ("Sexual Selection in Man"), Appendix A, on "The Origins of the Kiss."

[79] De Stendhal (*De l'Amour*) mentions that when in London he was on terms of friendship with an English actress who was the mistress of a wealthy colonel, but privately had another lover. One day the colonel arrived when the other man was present. "This gentleman has called about the pony I want to sell," said the actress. "I have come for a very different purpose," said the little man, and thus aroused a love which was beginning to languish.

[80] See Havelock Ellis, *Man and Woman*, chapter vi, "The Senses."

[81] This liability is emphasized by Adler, *Die Mangelhafte Geschlechtsempfindung des Weibes*, p. 125.

II.

The Definition of Sadism--De Sade--Masochism to some Extent Normal--Sacher-Masoch--No Real Line of Demarcation between Sadism and Masochism--Algolagnia includes both Groups of Manifestations--The Love-bite as a Bridge from Normal Phenomena to Algolagnia--The Fascination of Blood--The Most Extreme Perversions are Linked on to Normal Phenomena.

We thus see that there are here two separate groups of feelings: one, in the masculine line, which delights in displaying force and often inflicts pain or the simulacrum of pain; the other, in the feminine line, which delights in submitting to that force, and even finds pleasure in a slight amount of pain, or the idea of pain, when associated with the experiences of love. We see, also, that these two groups of feelings are complementary. Within the limits consistent with normal and healthy life, what men are impelled to give women love to receive. So that we need not unduly deprecate the "cruelty" of men within these limits, nor unduly commiserate the women who are subjected to it.

Such a conclusion, however, as we have also seen, only holds good within those normal limits which an attempt has here been made to determine. The phenomena we have been considering are strictly normal phenomena, having their basis in the conditions of tumescence and detumescence in animal and primitive human courtship. At one point, however, when discussing the phenomena of the love-bite, I referred to the facts which indicate how this purely normal manifestation yet insensibly passes over into the region of the morbid. It is an instance that enables us to realize how even the most terrible and repugnant sexual perversions are still demonstrably linked on to phenomena that are fundamentally normal. The love-bite may be said to give us the key to that perverse impulse which has been commonly called sadism.

There is some difference of opinion as to how "sadism" may be best defined. Perhaps the simplest and most usual definition is that of Krafft-Ebing, as sexual emotion associated with the wish to inflict pain and use violence, or, as he elsewhere expresses it, "the impulse to cruel and violent treatment of the opposite sex, and the coloring of the idea of such acts with lustful feeling." [83] A more complete definition is that of Moll, who describes sadism as a condition in which "the sexual impulse consists in the tendency to strike, ill-use, and humiliate the beloved person." [84] This definition has the advantage of bringing in the element of moral pain. A further extension is made in Féré's definition as "the need of association of violence and cruelty with sexual enjoyment, such violence or cruelty not being necessarily exerted by the person himself who seeks sexual pleasure in this association." [85] Garnier's definition, while comprising all these points, further allows for the fact that a certain degree of sadism may be regarded as normal. "Pathological sadism," he states, "is an impulsive and obsessing sexual perversion characterized by a close connection between suffering inflicted or mentally represented

and the sexual orgasm, without this necessary and sufficing condition frigidity usually remaining absolute."[86] It must be added that these definitions are very incomplete if by "sadism" we are to understand the special sexual perversions which are displayed in De Sade's novels. Iwan Bloch ("Eugen Dühren"), in the course of his book on De Sade, has attempted a definition strictly on this basis, and, as will be seen, it is necessary to make it very elaborate: "A connection, whether intentionally sought or offered by chance, of sexual excitement and sexual enjoyment with the real or only symbolic (ideal, illusionary) appearance of frightful and shocking events, destructive occurrences and practices, which threaten or destroy the life, health, and property of man and other living creatures, and threaten and interrupt the continuity of inanimate objects, whereby the person who from such occurrences obtains sexual enjoyment may either himself be the direct cause, or cause them to take place by means of other persons, or merely be the spectator, or, finally, be, voluntarily or involuntarily, the object against which these processes are directed."[87] This definition of sadism as found in De Sade's works is thus, more especially by its final clause, a very much wider conception than the usual definition.

Donatien Alphonse François, Marquis De Sade, was born in 1740 at Paris in the house of the great Condé. He belonged to a very noble, ancient, and distinguished Provençal family; Petrarch's Laura, who married a De Sade, was one of his ancestors, and the family had cultivated both arms and letters with success. He was, according to Lacroix, "an adorable youth whose delicately pale and dusky face, lighted up by two large black [according to another account blue] eyes, already bore the languorous imprint of the vice which was to corrupt his whole being"; his voice was "drawling and caressing"; his gait had "a softly feminine grace." Unfortunately there is no authentic portrait of him. His early life is sketched in letter iv of his *Aline et Valcourt*. On leaving the Collège-Louis-le-Grand he became a cavalry officer and went through the Seven Years' War in Germany. There can be little doubt that the experiences of his military life, working on a femininely vicious temperament, had much to do with the development of his perversion. He appears to have got into numerous scrapes, of which the details are unknown, and his father sought to marry him to the daughter of an aristocratic friend of his own, a noble and amiable girl of 20. It so chanced that when young De Sade first went to the house of his future wife only her younger sister, a girl of 13, was at home; with her

he at once fell in love and his love was reciprocated; they were both musical enthusiasts, and she had a beautiful voice. The parents insisted on carrying out the original scheme of marriage. De Sade's wife loved him, and, in spite of everything, served his interests with Griselda-like devotion; she was, Ginisty remarks, a saint, a saint of conjugal life; but her love was from the first only requited with repulsion, contempt, and suspicion. There were, however, children of the marriage; the career of the eldest--an estimable young man who went into the army and also had artistic ability, but otherwise had no community of tastes with his father--has been sketched by Paul Ginisty, who has also edited the letters of the Marquise. De Sade's passion for the younger sister continued (he idealized her as Juliette), though she was placed in a convent beyond his reach, and at a much later period he eloped with her and spent perhaps the happiest period of his life, soon terminated by her death. It is evident that this unhappy marriage was decisive in determining De Sade's career; he at once threw himself recklessly into every form of dissipation, spending his health and his substance sometimes among refinedly debauched nobles and sometimes among coarsely debauched lackeys. He was, however, always something of an artist, something of a student, something of a philosopher, and at an early period he began to write, apparently at the age of 23. It was at this age, and only a few months after his marriage, that on account of some excess he was for a time confined in Vincennes. He was destined to spend 27 years of his life in prisons, if we include the 13 years which in old age he passed in the asylum at Charenton. His actual offenses were by no means so terrible as those he loved to dwell on in imagination, and for the most part they have been greatly exaggerated. His most extreme offenses were the indecent and forcible flagellation in 1768 of a young woman, Rosa Keller, who had accosted him in the street for alms, and whom he induced by false pretenses to come to his house, and the administration of aphrodisiacal bonbons to some prostitutes at Marseilles. It is owing to the fact that the prime of his manhood was spent in prisons that De Sade fell back on dreaming, study, and novel-writing. Shut out from real life, he solaced his imagination with the perverted visions--to a very large extent, however, founded on knowledge of the real facts of perverted life in his time--which he has recorded in *_Justine_* (1781); *_Les 120 Journées de Sodome ou l'Ecole du Libertinage_* (1785); *_Aline et Valcour ou le Roman Philosophique_* (1788);

Juliette (1796); _La Philosophie dans le Boudoir_ (1795). These books constitute a sort of encyclopedia of sexual perversions, an eighteenth century _Psychopathia Sexualis_, and embody, at the same time, a philosophy. He was the first, Bloch remarks, who realized the immense importance of the sexual question. His general attitude may be illustrated by the following passage (as quoted by Lacassagne): "If there are beings in the world whose acts shock all accepted prejudices, we must not preach at them or punish them ... because their bizarre tastes no more depend upon themselves than it depends on you whether you are witty or stupid, well made or hump-backed.... What would become of your laws, your morality, your religion, your gallows, your Paradise, your gods, your hell, if it were shown that such and such fluids, such fibers, or a certain acridity in the blood, or in the animal spirits, alone suffice to make a man the object of your punishments or your rewards?" He was enormously well read, Bloch points out, and his interest extended to every field of literature: _belles lettres_, philosophy, theology, politics, sociology, ethnology, mythology, and history. Perhaps his favorite reading was travels. He was minutely familiar with the bible, though his attitude was extremely critical. His favorite philosopher was Lamettrie, whom he very frequently quotes, and he had carefully studied Machiavelli.

De Sade had foreseen the Revolution; he was an ardent admirer of Marat, and at this period he entered into public life as a mild, gentle, rather bald and gray-haired person. Many scenes of the Revolution were the embodiment in real life of De Sade's imagination; such, for instance, were the barbaric tortures inflicted, at the instigation of Théroigne de Méricourt, on La Belle Bouquetière. Yet De Sade played a very peaceful part in the events of that time, chiefly as a philanthropist, spending much of his time in the hospitals. He saved his parents-in-law from the scaffold, although they had always been hostile to him, and by his moderation aroused the suspicions of the revolutionary party, and was again imprisoned. Later he wrote a pamphlet against Napoleon, who never forgave him and had him shut up in Charenton as a lunatic; it was a not unusual method at that time of disposing of persons whom it was wished to put out of the way, and, notwithstanding De Sade's organically abnormal temperament, there is no reason to regard him as actually insane. Royer-Collard, an eminent alienist of that period, then at the

head of Charenton, declared De Sade to be sane, and his detailed report is still extant. Other specialists were of the same opinion. Bloch, who quotes these opinions (*_Neue Forschungen_*, etc., p. 370), says that the only possible conclusion is that De Sade was sane, but neurasthenic, and Eulenburg also concludes that he cannot be regarded as insane, although he was highly degenerate. In the asylum he amused himself by organizing a theater. Lacroix, many years later, questioning old people who had known him, was surprised to find that even in the memory of most virtuous and respectable persons he lived merely as an "*_aimable mauvais sujet_*." It is noteworthy that De Sade aroused, in a singular degree, the love and devotion of women,--whether or not we may regard this as evidence of the fascination exerted on women by cruelty. Janin remarks that he had seen many pretty little letters written by young and charming women of the great world, begging for the release of the "*_pauvre marquis_*."

Sardou, the dramatist, has stated that in 1855 he visited the Bicêtre and met an old gardener who had known De Sade during his reclusion there. He told that one of the marquis's amusements was to procure baskets of the most beautiful and expensive roses; he would then sit on a footstool by a dirty streamlet which ran through the courtyard, and would take the roses, one by one, gaze at them, smell them with a voluptuous expression, soak them in the muddy water, and fling them away, laughing as he did so. He died on the 2d of December, 1814, at the age of 74. He was almost blind, and had long been a martyr to gout, asthma, and an affection of the stomach. It was his wish that acorns should be planted over his grave and his memory effaced. At a later period his skull was examined by a phrenologist, who found it small and well formed; "one would take it at first for a woman's head." The skull belonged to Dr. Londe, but about the middle of the century it was stolen by a doctor who conveyed it to England, where it may possibly yet be found. [The foregoing account is mainly founded on Paul Lacroix, *_Revue de Paris_*, 1837, and *_Curiosités de l'Histoire de France_*, second series, *_Procès Célèbres_*, p. 225; Janin, *_Revue de Paris_*, 1834; Eugen Dühren (Iwan Bloch), *_Der Marquis de Sade und Seine Zeit_*, third edition, 1901; id., *_Neue Forschungen über den Marquis de Sade und Seine Zeit_*, 1904; Lacassagne, *_Vacher l'Eventreur et les Crimes Sadiques_*, 1899; Paul Ginisty, *_La Marquise de Sade_*, 1901.]

The attempt to define sadism strictly and penetrate to its roots in De Sade's personal temperament reveals a certain weakness in the current conception of this sexual perversion. It is not, as we might infer, both from the definition usually given and from its probable biological heredity from primitive times, a perversion due to excessive masculinity. The strong man is more apt to be tender than cruel, or at all events knows how to restrain within bounds any impulse to cruelty; the most extreme and elaborate forms of sadism (putting aside such as are associated with a considerable degree of imbecility) are more apt to be allied with a somewhat feminine organization. Montaigne, indeed, observed long ago that cruelty is usually accompanied by feminine softness.

In the same way it is a mistake to suppose that the very feminine woman is not capable of sadistic tendencies. Even if we take into account the primitive animal conditions of combat, the male must suffer as well as inflict pain, and the female must not only experience subjection to the male, but also share in the emotions of her partner's victory over his rivals. As bearing on these points, I may quote the following remarks written by a lady: "It is said that, the weaker and more feminine a woman is, the greater the subjection she likes. I don't think it has anything at all to do with the general character, but depends entirely on whether the feeling of constraint and helplessness affects her sexually. In men I have several times noticed that those who were most desirous of subjection to the women they loved had, in ordinary life, very strong and determined characters. I know of others, too, who with very weak characters are very imperious toward the women they care for. Among women I have often been surprised to see how a strong, determined woman will give way to a man she loves, and how tenacious of her own will may be some fragile, clinging creature who in daily life seems quite unable to act on her own responsibility. A certain amount of passivity, a desire to have their emotions worked on, seems to me, so far as my small experience goes, very common among ordinary, presumably normal men. A good deal of stress is laid on femininity as an attraction in a woman, and this may be so to very strong natures, but, so far as I have seen, the women who obtain extraordinary empire over men are those with a certain virility in their character and passions. If with this virility they combine a fragility or childishness of appearance which appeals to a man in another way at the same time, they appear to be irresistible."

I have noted some of the feminine traits in De Sade's temperament and appearance. The same may often be noted in sadists whose crimes were very much more serious and brutal than those of De Sade. A man who stabbed women in the streets at St. Louis was a waiter with a high-pitched, effeminate voice and boyish appearance. Reidel, the sadistic murderer, was timid, modest, and delicate; he was too shy to urinate in the presence of other people. A sadistic zoöphilist, described by A. Marie, who attempted to strangle a woman fellow-worker, had always been very timid, blushed with much facility, could not look even children in the eyes, or urinate in the presence of another person, or make sexual advances to women.

Kiernan and Moyer are inclined to connect the modesty and timidity of sadists with a disgust for normal coitus. They were called upon to examine an inverted married woman who had inflicted several hundred wounds, mostly superficial, with forks, scissors, etc., on the genital organs and other parts of a girl whom she had adopted from a "Home." This woman was very prominent in church and social matters in the city in which she lived, so that many clergymen and local persons of importance testified to her chaste, modest, and even prudish character; she was found to be sane at the time of the acts. (Moyer, Alienist and Neurologist, May, 1907, and private letter from Dr. Kiernan.)

We are thus led to another sexual perversion, which is usually considered the opposite of sadism. Masochism is commonly regarded as a peculiarly feminine sexual perversion, in women, indeed, as normal in some degree, and in man as a sort of inversion of the normal masculine emotional attitude, but this view of the matter is not altogether justified, for definite and pronounced masochism seems to be much rarer in women than sadism.[88] Krafft-Ebing, whose treatment of this phenomenon is, perhaps, his most valuable and original contribution to sexual psychology, has dealt very fully with the matter and brought forward many cases. He thus defines this perversion: "By masochism I understand a peculiar perversion of the psychical vita sexualis in which the individual affected, in sexual feeling and thought, is controlled by the idea of being completely and unconditionally subject to the will of a person of the opposite sex, of being treated by this person as by a master, humiliated and abused. This idea is colored by sexual feeling; the masochist lives in fancies in which he creates situations of this kind, and he often attempts to realize them." [89]

In a minor degree, not amounting to a complete perversion of the sexual instinct, this sentiment of abnegation, the desire to be even physically subjected to the adored woman, cannot be regarded as abnormal. More than two centuries before Krafft-Ebing appeared, Robert Burton, who was no mean psychologist, dilated on the fact that love is a kind of slavery. "They are commonly slaves," he wrote of lovers, "captives, voluntary servants; _amator amicæ mancipium_, as Castilio terms him; his mistress's servant, her drudge, prisoner, bondman, what not?"[90] Before Burton's time the legend of the erotic servitude of Aristotle was widely spread in Europe, and pictures exist of the venerable philosopher on all fours ridden by a woman with a whip.[91] In classic times various masochistic phenomena are noted with approval by Ovid. It has been pointed out by Moll[92] that there are traces of masochistic feeling in some of Goethe's poems, especially "Lilis Park" and "Erwin und Elmire." Similar traces have been found in the poems of Heine, Platen, Hamerling, and many other poets.[93] The poetry of the people is also said to contain many such traces. It may, indeed, be said that passion in its more lyric exaltations almost necessarily involves some resort to masochistic expression. A popular lady novelist in a novel written many years ago represents her hero, a robust soldier, imploring the lady of his love, in a moment of passionate exaltation, to trample on him, certainly without any wish to suggest sexual perversion. If it is true that the Antonio of Otway's *Venice Preserved* is a caricature of Shaftesbury, then it would appear that one of the greatest of English statesmen was supposed to exhibit very pronounced and characteristic masochistic tendencies; and in more recent days masochistic expressions have been noted as occurring in the love-letters of so emphatically virile a statesman as Bismarck.

Thus a minor degree of the masochistic tendency may be said to be fairly common, while its more pronounced manifestations are more common than pronounced sadism.[94] It very frequently affects persons of a sensitive, refined, and artistic temperament. It may even be said that this tendency is in the line of civilization. Krafft-Ebing points out that some of the most delicate and romantic love-episodes of the Middle Ages are distinctly colored by masochistic emotion.[95] The increasing tendency to masochism with increasing civilization becomes explicable if we accept Colin Scott's "secondary law of courting" as accessory to the primary law that the male is active, and the female passive and imaginatively attentive to the states of the excited male. According to the secondary law, "the female develops a superadded activity, the male becoming relatively passive and imaginatively attentive to the psychical and bodily states of the

female." [96] We may probably agree that this "secondary law of courting" does really represent a tendency of love in individuals of complex and sensitive nature, and the outcome of such a receptive attitude on the part of the male is undoubtedly in well-marked cases a desire of submission to the female's will, and a craving to experience in some physical or psychic form, not necessarily painful, the manifestations of her activity.

When we turn from vague and unpronounced forms of the masochistic tendency to the more definite forms in which it becomes an unquestionable sexual perversion, we find a very eminent and fairly typical example in Rousseau, an example all the more interesting because here the subject has himself portrayed his perversion in his famous *_Confessions_*. It is, however, the name of a less eminent author, the Austrian novelist, Sacher-Masoch, which has become identified with the perversion through the fact that Krafft-Ebing fixed upon it as furnishing a convenient counterpart to the term "sadism." It is on the strength of a considerable number of his novels and stories, more especially of *_Die Venus im Pelz_*, that Krafft-Ebing took the scarcely warrantable liberty of identifying his name, while yet living, with a sexual perversion.

Sacher-Masoch's biography has been written with intimate knowledge and much candor by C.F. von Schlichtegroll (*_Sacher-Masoch und der Masochismus_*, 1901) and, more indirectly, by his first wife Wanda von Sacher-Masoch in her autobiography (*_Meine Lebensbeichte_*, 1906; French translation, *_Confession de ma Vie_*, 1907). Schlichtegroll's book is written with a somewhat undue attempt to exalt his hero and to attribute his misfortunes to his first wife. The autobiography of the latter, however, enables us to form a more complete picture of Sacher-Masoch's life, for, while his wife by no means spares herself, she clearly shows that Sacher-Masoch was the victim of his own abnormal temperament, and she presents both the sensitive, refined, exalted, and generous aspects of his nature, and his morbid, imaginative, vain aspects.

Leopold von Sacher-Masoch was born in 1836 at Lemberg in Galicia. He was of Spanish, German, and more especially Slavonic race. The founder of the family may be said to be a certain Don Matthias Sacher, a young Spanish nobleman, in the sixteenth century, who settled in Prague. The novelist's father was director of police in Lemberg and married Charlotte von Masoch, a Little Russian lady of noble birth. The novelist, the eldest child of this

union, was not born until after nine years of marriage, and in infancy was so delicate that he was not expected to survive. He began to improve, however, when his mother gave him to be suckled to a robust Russian peasant woman, from whom, as he said later, he gained not only health, but "his soul"; from her he learned all the strange and melancholy legends of her people and a love of the Little Russians which never left him. While still a child young Sacher-Masoch was in the midst of the bloody scenes of the revolution which culminated in 1848. When he was 12 the family migrated to Prague, and the boy, though precocious in his development, then first learned the German language, of which he attained so fine a mastery. At a very early age he had found the atmosphere, and even some of the most characteristic elements, of the peculiar types which mark his work as a novelist.

It is interesting to trace the germinal elements of those peculiarities which so strongly affected his imagination on the sexual side. As a child, he was greatly attracted by representations of cruelty; he loved to gaze at pictures of executions, the legends of martyrs were his favorite reading, and with the onset of puberty he regularly dreamed that he was fettered and in the power of a cruel woman who tortured him. It has been said by an anonymous author that the women of Galicia either rule their husbands entirely and make them their slaves or themselves sink to be the wretchedest of slaves. At the age of 10, according to Schlichtegroll's narrative, the child Leopold witnessed a scene in which a woman of the former kind, a certain Countess Xenobia X., a relative of his own on the paternal side, played the chief part, and this scene left an undying impress on his imagination. The Countess was a beautiful but wanton creature, and the child adored her, impressed alike by her beauty and the costly furs she wore. She accepted his devotion and little services and would sometimes allow him to assist her in dressing; on one occasion, as he was kneeling before her to put on her ermine slippers, he kissed her feet; she smiled and gave him a kick which filled him with pleasure. Not long afterward occurred the episode which so profoundly affected his imagination. He was playing with his sisters at hide-and-seek and had carefully hidden himself behind the dresses on a clothes-rail in the Countess's bedroom. At this moment the Countess suddenly entered the house and ascended the stairs, followed by a lover, and the child, who dared not betray his presence, saw the

countess sink down on a sofa and begin to caress her lover. But a few moments later the husband, accompanied by two friends, dashed into the room. Before, however, he could decide which of the lovers to turn against the Countess had risen and struck him so powerful a blow in the face with her fist that he fell back streaming with blood. She then seized a whip, drove all three men out of the room, and in the confusion the lover slipped away. At this moment the clothes-rail fell and the child, the involuntary witness of the scene, was revealed to the Countess, who now fell on him in anger, threw him to the ground, pressed her knee on his shoulder, and struck him unmercifully. The pain was great, and yet he was conscious of a strange pleasure. While this castigation was proceeding the Count returned, no longer in a rage, but meek and humble as a slave, and kneeled down before her to beg forgiveness. As the boy escaped he saw her kick her husband. The child could not resist the temptation to return to the spot; the door was closed and he could see nothing, but he heard the sound of the whip and the groans of the Count beneath his wife's blows.

It is unnecessary to insist that in this scene, acting on a highly sensitive and somewhat peculiar child, we have the key to the emotional attitude which affected so much of Sacher-Masoch's work. As his biographer remarks, woman became to him, during a considerable part of his life, a creature at once to be loved and hated, a being whose beauty and brutality enabled her to set her foot at will on the necks of men, and in the heroine of his first important novel, the *Emissär*, dealing with the Polish Revolution, he embodied the contradictory personality of Countess Xenobia. Even the whip and the fur garments, Sacher-Masoch's favorite emotional symbols, find their explanation in this early episode. He was accustomed to say of an attractive woman: "I should like to see her in furs," and, of an unattractive woman: "I could not imagine her in furs." His writing-paper at one time was adorned with the figure of a woman in Russian Boyar costume, her cloak lined with ermine, and brandishing a scourge. On his walls he liked to have pictures of women in furs, of the kind of which there is so magnificent an example by Rubens in the gallery at Munich. He would even keep a woman's fur cloak on an ottoman in his study and stroke it from time to time, finding that his brain thus received the same kind of stimulation as Schiller found in the odor of rotten apples.[97]

At the age of 13, in the revolution of 1848, young Sacher-Masoch received his baptism of fire; carried away in the popular movement, he helped to defend the barricades together with a young lady, a relative of his family, an amazon with a pistol in her girdle, such as later he loved to depict. This episode was, however, but a brief interruption of his education; he pursued his studies with brilliance, and on the higher side his education was aided by his father's esthetic tastes. Amateur theatricals were in special favor at his home, and here even the serious plays of Goethe and Gogol were performed, thus helping to train and direct the boy's taste. It is, perhaps, however, significant that it was a tragic event which, at the age of 16, first brought to him the full realization of life and the consciousness of his own power. This was the sudden death of his favorite sister. He became serious and quiet, and always regarded this grief as a turning-point in his life.

At the Universities of Prague and Graz he studied with such zeal that when only 19 he took his doctor's degree in law and shortly afterward became a privatdocent for German history at Graz. Gradually, however, the charms of literature asserted themselves definitely, and he soon abandoned teaching. He took part, however, in the war of 1866 in Italy, and at the battle of Solferino he was decorated on the field for bravery in action by the Austrian field-marshal. These incidents, however, had little disturbing influence on Sacher-Masoch's literary career, and he was gradually acquiring a European reputation by his novels and stories.

A far more seriously disturbing influence had already begun to be exerted on his life by a series of love-episodes. Some of these were of slight and ephemeral character; some were a source of unalloyed happiness, all the more so if there was an element of extravagance to appeal to his Quixotic nature. He always longed to give a dramatic and romantic character to his life, his wife says, and he spent some blissful days on an occasion when he ran away to Florence with a Russian princess as her private secretary. Most often these episodes culminated in deception and misery. It was after a relationship of this kind from which he could not free himself for four years that he wrote Die Geschiedene Frau, Passionsgeschichte eines Idealisten, putting

into it much of his own personal history. At one time he was engaged to a sweet and charming young girl. Then it was that he met a young woman at Graz, Laura Rümelin, 27 years of age, engaged as a glove-maker, and living with her mother. Though of poor parentage, with little or no knowledge of the world, she had great natural ability and intelligence. Schlichtegroll represents her as spontaneously engaging in a mysterious intrigue with the novelist. Her own detailed narrative renders the circumstances more intelligible. She approached Sacher-Masoch by letter, adopting for disguise the name of his heroine Wanda von Dunajev, in order to recover possession of some compromising letters which had been written to him, as a joke, by a friend of hers. Sacher-Masoch insisted on seeing his correspondent before returning the letters, and with his eager thirst for romantic adventure he imagined that she was a married woman of the aristocratic world, probably a Russian countess, whose simple costume was a disguise. Not anxious to reveal the prosaic facts, she humored him in his imaginations and a web of mystification was thus formed. A strong attraction grew up on both sides and, though for some time Laura Rümelin maintained the mystery and held herself aloof from him, a relationship was formed and a child born. Thereupon, in 1893, they married. Before long, however, there was disillusion on both sides. She began to detect the morbid, chimerical, and unpractical aspects of his character, and he realized that not only was his wife not an aristocrat, but, what was of more importance to him, she was by no means the domineering heroine of his dreams. Soon after marriage, in the course of an innocent romp in which the whole of the small household took part, he asked his wife to inflict a whipping on him. She refused, and he thereupon suggested that the servant should do it; the wife failed to take this idea seriously; but he had it carried out, with great satisfaction at the severity of the castigation he received. When, however, his wife explained to him that, after this incident, it was impossible for the servant to stay, Sacher-Masoch quite agreed and she was at once discharged. But he constantly found pleasure in placing his wife in awkward or compromising circumstances, a pleasure she was too normal to share. This necessarily led to much domestic wretchedness. He had persuaded her, against her wish, to whip him nearly every day, with whips which he devised, having nails attached to them. He found this a stimulant to his literary work, and it enabled him to dispense in his novels with his stereotyped

heroine who is always engaged in subjugating men, for, as he explained to his wife, when he had the reality in his life he was no longer obsessed by it in his imaginative dreams. Not content with this, however, he was constantly desirous for his wife to be unfaithful. He even put an advertisement in a newspaper to the effect that a young and beautiful woman desired to make the acquaintance of an energetic man. The wife, however, though she wished to please her husband, was not anxious to do so to this extent. She went to an hotel by appointment to meet a stranger who had answered this advertisement, but when she had explained to him the state of affairs he chivalrously conducted her home. It was some time before Sacher-Masoch eventually succeeded in rendering his wife unfaithful. He attended to the minutest details of her toilette on this occasion, and as he bade her farewell at the door he exclaimed: "How I envy him!" This episode thoroughly humiliated the wife, and from that moment her love for her husband turned to hate. A final separation was only a question of time. Sacher-Masoch formed a relationship with Hulda Meister, who had come to act as secretary and translator to him, while his wife became attached to Rosenthal, a clever journalist later known to readers of the Figaro as "Jacques St.-Cère," who realized her painful position and felt sympathy and affection for her. She went to live with him in Paris and, having refused to divorce her husband, he eventually obtained a divorce from her; she states, however, that she never at any time had physical relationships with Rosenthal, who was a man of fragile organization and health. Sacher-Masoch united himself to Hulda Meister, who is described by the first wife as a prim and faded but coquettish old maid, and by the biographer as a highly accomplished and gentle woman, who cared for him with almost maternal devotion. No doubt there is truth in both descriptions. It must be noted that, as Wanda clearly shows, apart from his abnormal sexual temperament, Sacher-Masoch was kind and sympathetic, and he was strongly attached to his eldest child. Eulenburg also quotes the statement of a distinguished Austrian woman writer acquainted with him that, "apart from his sexual eccentricities, he was an amiable, simple, and sympathetic man with a touchingly tender love for his children." He had very few needs, did not drink or smoke, and though he liked to put the woman he was attached to in rich furs and fantastically gorgeous raiment he dressed himself with extreme simplicity. His wife quotes the saying of another woman that he was as simple as a

child and as naughty as a monkey.

In 1883 Sacher-Masoch and Hulda Meister settled in Lindheim, a village in Germany near the Taunus, a spot to which the novelist seems to have been attached because in the grounds of his little estate was a haunted and ruined tower associated with a tragic medieval episode. Here, after many legal delays, Sacher-Masoch was able to render his union with Hulda Meister legitimate; here two children were in due course born, and here the novelist spent the remaining years of his life in comparative peace. At first, as is usual, treated with suspicion by the peasants, Sacher-Masoch gradually acquired great influence over them; he became a kind of Tolstoy in the rural life around him, the friend and confidant of all the villagers (something of Tolstoy's communism is also, it appears, to be seen in the books he wrote at this time), while the theatrical performances which he inaugurated, and in which his wife took an active part, spread the fame of the household in many neighboring villages. Meanwhile his health began to break up; a visit to Nauheim in 1894 was of no benefit, and he died March 9, 1895.

A careful consideration of the phenomena of sadism and masochism may be said to lead us to the conclusion that there is no real line of demarcation. Even De Sade himself was not a pure sadist, as Bloch's careful definition is alone sufficient to indicate; it might even be argued that De Sade was really a masochist; the investigation of histories of sadism and masochism, even those given by Krafft-Ebing (as, indeed, Colin Scott and Féré have already pointed out), constantly reveals traces of both groups of phenomena in the same individual. They cannot, therefore, be regarded as opposed manifestations. This has been felt by some writers, who have, in consequence, proposed other names more clearly indicating the relationship of the phenomena. Féré speaks of sexual algophily[98]; he only applies the term to masochism; it might equally well be applied to sadism. Schrenck-Notzing, to cover both sadism and masochism, has invented the term algolagnia (algos, pain, and lagnos sexually excited), and calls the former active, the latter passive, algolagnia.[99] Eulenburg has also emphasized the close connection between these groups of perverted sexual manifestations, and has adopted the same terms, adding the further group of ideal (illusionary) algolagnia, to cover the cases in which the mere autosuggestive representation of pain, inflicted or suffered, suffices to give sexual gratification.[100]

A brief discussion of the terms "sadism" and "masochism" has imposed itself upon us at this point because as soon as, in any study of the relationship between love and pain, we pass over the limits of normal manifestations into a region which is more or less abnormal, these two conceptions are always brought before us, and it was necessary to show on what grounds they are here rejected as the pivots on which the discussion ought to turn. We may accept them as useful terms to indicate two groups of clinical phenomena; but we cannot regard them as of any real scientific value. Having reached this result, we may continue our consideration of the love-bite, as the normal manifestation of the connection between love and pain which most naturally leads us across the frontier of the abnormal.

The result of the love-bite in its extreme degree is to shed blood. This cannot be regarded as the direct aim of the bite in its normal manifestations, for the mingled feelings of close contact, of passionate gripping, of symbolic devouring, which constitute the emotional accompaniments of the bite would be too violently discomposed by actual wounding and real shedding of blood. With some persons, however, perhaps more especially women, the love-bite is really associated with a conscious desire, even if more or less restrained, to draw blood, a real delight in this process, a love of blood. Probably this only occurs in persons who are not absolutely normal, but on the borderland of the abnormal. We have to admit that this craving has, however, a perfectly normal basis. There is scarcely any natural object with so profoundly emotional an effect as blood, and it is very easy to understand why this should be so.[101] Moreover, blood enters into the sphere of courtship by virtue of the same conditions by which cruelty enters into it; they are both accidents of combat, and combat is of the very essence of animal and primitive human courtship, certainly its most frequent accompaniment. So that the repelling or attracting fascination of blood may be regarded as a by-product of normal courtship, which, like other such by-products, may become an essential element of abnormal courtship.[102]

Normally the fascination of blood, if present at all during sexual excitement, remains more or less latent, either because it is weak or because the checks that inhibit it are inevitably very powerful. Occasionally it becomes more clearly manifest, and this may happen early in life. Féré records the case of a man of Anglo-Saxon origin, of sound heredity so far as could be ascertained and presenting no obvious stigmata of degeneration, who first experienced sexual manifestations at the age of 5 when a boy cousin was attacked by bleeding at the nose. It was the first

time he had seen such a thing and he experienced erection and much pleasure at the sight. This was repeated the next time the cousin's nose bled and also whenever he witnessed any injuries or wounds, especially when occurring in males. A few years later he began to find pleasure in pinching and otherwise inflicting slight suffering. This sadism was not, however, further developed, although a tendency to inversion persisted.[103]

Somewhat similar may have been the origin of the attraction of blood in a case which has been reported to me of a youth of 17, the youngest of a large family who are all very strong and entirely normal. He is himself, however, delicate, overgrown, with a narrow chest, a small head, and babyish features, while mentally he is backward, with very defective memory and scant powers of assimilation. He is intensely nervous, peevish, and subject to fits of childish rage. He takes violent fancies to persons of his own sex. But he appears to have only one way of obtaining sexual excitement and gratification. It is his custom to get into a hot bath and there to produce erection and emission, not by masturbation, but by thinking of flowing blood. He does not associate himself with the causation of this imaginary flow of blood; he is merely the passive but pleased spectator. He is aware of his peculiarity and endeavors to shake it off, but his efforts to obtain normal pleasure by thinking of a girl are vain.

I may here narrate a case which has been communicated to me of algolagnia in a woman, combined with sexual hyperesthesia.

R.D., aged 25, married, and of good social position; she is a small and dark woman, restless and alert in manner. She has one child.

She has practised masturbation from an early age--ever since she can remember--by the method of external friction and pressure. From the age of 17 she was able (and is still) to produce the orgasm almost without effort, by calling up the image of any man who had struck her fancy. She has often done so while seated talking to such a man, even when he is almost a stranger; in doing it, she says, a tightening of the muscles of the thighs and the slightest movement are sufficient. Ugly men (if not deformed), as well as men with the reputation of being roués,

greatly excite her sexually, more especially if of good social position, though this is not essential.

At the age of 18 she became hysterical, probably, she herself believes, in consequence of a great increase at that time of indulgence in masturbation. The doctors, apparently suspecting her habits, urged her parents to get her married early. She married, at the age of 20, a man about twice her own age.

As a child (and in a less degree still) she was very fond of watching dog-fights. This spectacle produced strong sexual feelings and usually orgasm, especially if much blood was shed during the fight. Clean cuts and wounds greatly attract her, whether on herself or a man. She has frequently slightly cut or scratched herself "to see the blood," and likes to suck the wound, thinking the taste "delicious." This produces strong sexual feelings and often orgasm, especially if at the time she thinks of some attractive man and imagines that she is sucking his blood. The sight of injury to a woman only very slightly affects her, and that, she thinks, only because of an involuntary association of ideas. Nor has the sight of suffering in illness any exciting effects, only that which is due to violence, and when there is a visible cause for the suffering, such as cuts and wounds. (Bruises, from the absence of blood, have only a slight effect.) The excitement is intensified if she imagines that she has herself inflicted the injury. She likes to imagine that the man wished to rape her, and that she fought him in order to make him more greatly value her favor, so wounding him.

Impersonal ideas of torture also excite her. She thinks Fox's Book of Martyrs "lovely," and the more horrible and bloody the tortures described the greater is the sexual excitement produced. The book excites her from the point of view of the torturer, not that of the victim. She has frequently masturbated while reading it.

So far as practicable she has sought to carry out these ideas in her relations with her husband. She has several times bitten him till the blood came and sucked the bite during coitus. She likes to bite him enough to make him wince. The pleasure is greatly heightened by thinking of various tortures, chiefly by cutting. She likes to have her husband talk to her, and she to him, of all

the tortures they could inflict on each other. She has, however, never actually tried to carry out these tortures. She would like to, but dares not, as she is sure he could not endure them. She has no desire for her husband to try them on her, although she likes to hear him talk about it.

She is at the same time fond of normal coitus, even to excess. She likes her husband to remain entirely passive during connection, so that he can continue in a state of strong erection for a long time. She can thus, she says, procure for herself the orgasm a number of times in succession, even nine or ten, quite easily. On one occasion she even had the orgasm twenty-six times within about one and a quarter hours, her husband during this time having two orgasms. (She is quite certain about the accuracy of this statement.) During this feat much talk about torture was indulged in, and it took place after a month's separation from her husband, during which she was careful not to masturbate, so that she might have "a real good time" when he came back. She acknowledges that on this occasion she was a "complete wreck" for a couple of days afterward, but states that usually ten or a dozen orgasms (or spasms, as she terms them) only make her "feel lively." She becomes frenzied with excitement during intercourse and insensible to everything but the pleasure of it.

She has never hitherto allowed anyone (except her husband after marriage) to know of her sadistic impulses, nor has she carried them out with anyone, though she would like to, if she dared. Nor has she allowed any man but her husband to have connection with her or to take any liberties.

Outbursts of sadism may occur episodically in fairly normal persons. Thus, Coutagne describes the case of a lad of 17--always regarded as quite normal, and without any signs of degeneracy, even on careful examination, or any traces of hysteria or alcoholism, though there was insanity among his cousins--who had had occasional sexual relations for a year or two, and on one occasion, being in a state of erection, struck the girl three times on the breast and abdomen with a kitchen knife bought for the purpose. He was much ashamed of his act immediately afterward, and, all the circumstances being taken into consideration, he was acquitted by the court.[104] Here we seem to have the obscure and latent fascination of blood, which is almost normal, germinating momentarily into an active impulse which is distinctly abnormal, though it produced little beyond

those incisions which Vatsyayana disapproved of, but still regarded as a part of courtship. One step more and we are amid the most outrageous and extreme of all forms of sexual perversion: with the heroes of De Sade's novels, who, in exemplification of their author's most cherished ideals, plan scenes of debauchery in which the flowing of blood is an essential element of coitus; with the Marshall Gilles de Rais and the Hungarian Countess Bathory, whose lust could only be satiated by the death of innumerable victims.

This impulse to stab--with no desire to kill, or even in most cases to give pain, but only to draw blood and so either stimulate or altogether gratify the sexual impulse--is no doubt the commonest form of sanguinary sadism. These women-stabbers have been known in France as piqueurs for nearly a century, and in Germany are termed Stecher or Messerstecher (they have been studied by Näcke, "Zur Psychologie der sadistischen Messerstecher," Archiv für Kriminal-Anthropologie, Bd. 35, 1909). A case of this kind where a man stabbed girls in the abdomen occurred in Paris in the middle of the eighteenth century, and in 1819 or 1820 there seems to have been an epidemic of piqueurs in Paris; as we learn from a letter of Charlotte von Schiller's to Knebel; the offenders (though perhaps there was only one) frequented the Boulevards and the Palais Royal and stabbed women in the buttocks or thighs; they were never caught. About the same time similar cases of a slighter kind occurred in London, Brussels, Hamburg, and Munich.

Stabbers are nearly always men, but cases of the same perversion in women are not unknown. Thus Dr. Kiernan informs me of an Irish woman, aged 40, and at the beginning of the menopause, who, in New York in 1909, stabbed five men with a hatpin. The motive was sexual and she told one of the men that she stabbed him because she "loved" him.

Gilles de Rais, who had fought beside Joan of Arc, is the classic example of sadism in its extreme form, involving the murder of youths and maidens. Bernelle considers that there is some truth in the contention of Huysmans that the association with Joan of Arc was a predisposing cause in unbalancing Gilles de Rais. Another cause was his luxurious habit of life. He himself, no doubt rightly, attached importance to the suggestions received in reading Suetonius. He appears to have been a sexually precocious

child, judging from an obscure passage in his confessions. He was artistic and scholarly, fond of books, of the society of learned men, and of music. Bernelle sums him up as "a pious warrior, a cruel and keen artist, a voluptuous assassin, an exalted mystic," who was at the same time unbalanced, a superior degenerate, and morbidly impulsive. (The best books on Gilles de Rais are the Abbé Bossard's Gilles de Rais, in which, however, the author, being a priest, treats his subject as quite sane and abnormally wicked; Huysmans's novel, La-Bas, which embodies a detailed study of Gilles de Rais, and F.H. Bernelle's Thèse de Paris, La Psychose de Gilles de Rais, 1910.)

The opinion has been hazarded that the history of Gilles de Rais is merely a legend. This view is not accepted, but there can be no doubt that the sadistic manifestations which occurred in the Middle Ages were mixed up with legendary and folk-lore elements. These elements centered on the conception of the werwolf, supposed to be a man temporarily transformed into a wolf with blood-thirsty impulses. (See, e.g., articles "Werwolf" and "Lycanthropy" in Encyclopædia Britannica.) France, especially, was infested with werwolves in the sixteenth century. In 1603, however, it was decided at Bordeaux, in a trial involving a werwolf, that lycanthropy was only an insane delusion. Dumas ("Les Loup-Garous," Journal de Psychologie Normale et Pathologique, May-June, 1907) argues that the medieval werwolves were sadists whose crimes were largely imaginative, though sometimes real, the predecessor of the modern Jack the Ripper. The complex nature of the elements making up the belief in the werwolf is emphasized by Ernest Jones, Der Alptraum, 1912.

Related to the werwolf, but distinct, was the vampire, supposed to be a dead person who rose from the dead to suck the blood of the living during sleep. By way of reprisal the living dug up, exorcised, and mutilated the supposed vampires. This was called vampirism. The name vampire was then transferred to the living person who had so treated a corpse. All profanation of the corpse, whatever its origin, is now frequently called vampirism (Epaulow, Vampirisme, Thèse de Lyon, 1901; id., "Le Vampire du Muy," Archives d'Anthropologie Criminelle, Sept., 1903). The earliest definite reference to necrophily is in Herodotus, who tells (bk. ii, ch. lxxxix) of an Egyptian who had connection with the corpse of a woman recently dead. Epaulow gives various old

cases and, at full length, the case which he himself investigated, of Ardisson, the "Vampire du Muy." W.A.F. Browne also has an interesting article on "Necrophilism" (Journal of Mental Science, Jan., 1875) which he regards as atavistic. When there is, in addition, mutilation of the corpse, the condition is termed necrosadism. There seems usually to be no true sadism in either necrosadism or necrophilism. (See, however, Bloch, Beiträge, vol. ii, p. 284 et seq.)

It must be said also that cases of rape followed by murder are quite commonly not sadistic. The type of such cases is represented by Soleilland, who raped and then murdered children. He showed no sadistic perversion. He merely killed to prevent discovery, as a burglar who is interrupted may commit murder in order to escape. (E. Dupré, "L'Affaire Soleilland," Archives d'Anthropologie Criminelle, Jan.-Feb., 1910.)

A careful and elaborate study of a completely developed sadist has been furnished by Lacassagne, Rousset, and Papillon ("L'Affaire Reidal," Archives d'Anthropologie Criminelle, Oct.-Nov., 1907). Reidal, a youth of 18, a seminarist, was a congenital sanguinary sadist who killed another youth and was finally sent to an asylum. From the age of 4 he had voluptuous ideas connected with blood and killing, and liked to play at killing with other children. He was of infantile physical development, with a pleasant, childish expression of face, very religious, and hated obscenity and immorality. But the love of blood and murder was an irresistible obsession and its gratification produced immense emotional relief.

Sadism generally has been especially studied by Lacassagne, Vacher l'Eventreur et les Crimes Sadiques, 1899. Zoösadism, or sadism toward animals, has been dealt with by P. Thomas, "Le Sadisme sur les Animaux," Archives d'Anthropologie Criminelle, Sept., 1903. Auto-sadism, or "auto-erotic cruelty," that is to say, injuries inflicted on a person by himself with a sexual motive, has been investigated by G. Bach (Sexuelle Verrirungen des Menschen und der Nature, p. 427); this condition seems, however, a form of algolagnia more masochistic than sadistic in character.

With regard to the medico-legal aspects, Kiernan ("Responsibility

in Active Allography," *_Medicine_*, April, 1903) sets forth the reasons in favor of the full and complete responsibility of sadists, and Harold Moyer comes to the same conclusion ("Is Sexual Perversion Insanity?" *_Alienist and Neurologist_*, May, 1907). See also Thoinot's *_Medico-legal Aspects of Moral Offenses_* (edited by Weysse, 1911), ch. xviii. While we are probably justified in considering the sadist as morally not insane in the technical sense, we must remember that he is, for the most part, highly abnormal from the outset. As Gaupp points out (*_Sexual-Probleme_*, Oct., 1909, p. 797), we cannot measure the influences which create the sadist and we must not therefore attempt to "punish" him, but we are bound to place him in a position where he will not injure society.

It is enough here to emphasize the fact that there is no solution of continuity in the links that bind the absolutely normal manifestations of sex with the most extreme violations of all human law. This is so true that in saying that these manifestations are violations of all human law we cannot go on to add, what would seem fairly obvious, that they are violations also of all natural law. We have but to go sufficiently far back, or sufficiently far afield, in the various zoölogical series to find that manifestations which, from the human point of view, are in the extreme degree abnormally sadistic here become actually normal. Among very various species wounding and rending normally take place at or immediately after coitus; if we go back to the beginning of animal life in the protozoa sexual conjugation itself is sometimes found to present the similitude, if not the actuality, of the complete devouring of one organism by another. Over a very large part of nature, as it has been truly said, "but a thin veil divides love from death." [105]

There is, indeed, on the whole, a point of difference. In that abnormal sadism which appears from time to time among civilized human beings it is nearly always the female who becomes the victim of the male. But in the normal sadism which occurs throughout a large part of nature it is nearly always the male who is the victim of the female. It is the male spider who impregnates the female at the risk of his life and sometimes perishes in the attempt; it is the male bee who, after intercourse with the queen, falls dead from that fatal embrace, leaving her to fling aside his entrails and calmly pursue her course. [106] If it may seem to some that the course of our inquiry leads us to contemplate with equanimity, as a natural phenomenon, a certain semblance of cruelty in man in his relations with woman, they may, if they will, reflect that this phenomenon is but a

very slight counterpoise to that cruelty which has been naturally exerted by the female on the male long even before man began to be.

[94] Iwan Bloch considers that it is the commonest of all sexual perversions, more prevalent even than homosexuality.

[95] It has no doubt been prominent in earlier civilization. A very pronounced masochist utterance may be found in an ancient Egyptian love-song written about 1200 B.C.: "Oh! were I made her porter, I should cause her to be wrathful with me. Then when I did but hear her voice, the voice of her anger, a child shall I be for fear." (Wiedemann, *Popular Literature in Ancient Egypt*, p. 9.) The activity and independence of the Egyptian women at the time may well have offered many opportunities to the ancient Egyptian masochist.

[97] It must not be supposed that the attraction of fur or of the whip is altogether accounted for by such a casual early experience as in Sacher-Masoch's case served to evoke it. The whip we shall have to consider briefly later on. The fascination exerted by fur, whether manifesting itself as love or fear, would appear to be very common in many children, and almost instinctive. Stanley Hall, in his "Study of Fears" (*American Journal of Psychology*, vol. viii, p. 213) has obtained as many as 111 well-developed cases of fear of fur, or, as he terms it, *doraphobia*, in some cases appearing as early as the age of 6 months, and he gives many examples. He remarks that the love of fur is still more common, and concludes that "both this love and fear are so strong and instinctive that they can hardly be fully accounted for without recourse to a time when association with animals was far closer than now, or perhaps when our remote ancestors were hairy." (Cf. "Erotic Symbolism," iv, in the fifth volume of these *Studies*.)

[101] I have elsewhere dealt with this point in discussing the special emotional tone of red (Havelock Ellis, "The Psychology of Red," *Popular Science Monthly*, August and September, 1900).

[102] It is probable that the motive of sexual murders is nearly always to shed blood, and not to cause death. Leppmann (*Bulletin Internationale de Droit Pénal*, vol. vi, 1896, p. 115) points out that such murders are

generally produced by wounds in the neck or mutilation of the abdomen, never by wounds of the head. T. Claye Shaw, who terms the lust for blood hemothymia, has written an interesting and suggestive paper ("A Prominent Motive in Murder," Lancet, June 19, 1909) on the natural fascination of blood. Blumröder, in 1830, seems to have been the first who definitely called attention to the connection between lust and blood.

[104] H. Coutagne, "Cas de Perversion Sanguinaire de l'Instinct Sexuel," Annales Médico-Psychologiques, July and August, 1893. D.S. Booth (Alienist and Neurologist, Aug., 1906) describes the case of a man of neurotic heredity who slightly stabbed a woman with a penknife when on his way to a prostitute.

[105] Kiernan appears to have been the first to suggest the bearing of these facts on sadism, which he would regard as the abnormal human form of phenomena which may be found at the very beginning of animal life, as, indeed, the survival or atavistic reappearance of a primitive sexual cannibalism. See his "Psychological Aspects of the Sexual Appetite," Alienist and Neurologist, April, 1891, and "Responsibility in Sexual Perversion," Chicago Medical Recorder, March, 1892. Penta has also independently developed the conception of the biological basis of sadism and other sexual perversions (I Pervertimenti Sessuali, 1893). It must be added that, as Remy de Gourmont points out (Promenades Philosophiques, 2d series, p. 273), this sexual cannibalism exerted by the female may have, primarily, no erotic significance: "She eats him because she is hungry and because when exhausted he is an easy prey."

[106] In the chapter entitled "Le Vol Nuptial" of his charming book on the life of bees Maeterlinck has given an incomparable picture of the tragic courtship of these insects.

III.

Flagellation as a Typical Illustration of Algolagnia--Causes of Connection between Sexual Emotion and Whipping--Physical Causes--Psychic Causes probably more Important--The Varied Emotional Associations of Whipping--Its Wide Prevalence.

The whole problem of love and pain, in its complementary sadistic and masochistic aspects, is presented to us in connection with the pleasure sometimes experienced in whipping, or in being whipped, or in witnessing or thinking about scenes of whipping. The association of sexual emotion with bloodshed is so extreme a perversion, it so swiftly sinks to phases that are obviously cruel, repulsive, and monstrous in an extreme degree, that it is necessarily rare, and those who are afflicted by it are often more or less imbecile. With whipping it is otherwise. Whipping has always been a recognized religious penance; it is still regarded as a beneficial and harmless method of chastisement; there is nothing necessarily cruel, repulsive, or monstrous in the idea or the reality of whipping, and it is perfectly easy and natural for an interest in the subject to arise in an innocent and even normal child, and thus to furnish a germ around which, temporarily at all events, sexual ideas may crystallize. For these reasons the connection between love and pain may be more clearly brought out in connection with whipping than with blood.

There is, by no means, any necessary connection between flagellation and the sexual emotions. If there were, this form of penance would not have been so long approved or at all events tolerated by the Church.[107]

As a matter of fact, indeed, it was not always approved or even tolerated. Pope Adrian IV in the eighth century forbade priests to beat their penitents, and at the time of the epidemic of flagellation in the thirteenth century, which was highly approved by many holy men, the abuses were yet so frequent that Clement VI issued a bull against these processions. All such papal prohibitions remained without effect. The association of religious flagellation with perverted sexual motives is shown by its condemnation in later ages by the Inquisition, which was accustomed to prosecute the priests who, in prescribing flagellation as a penance, exerted it personally, or caused it to be inflicted on the stripped penitent in his presence, or made a woman penitent discipline him, such offences being regarded as forms of "solicitation." [108] There seems even to be some reason to suppose that the religious flagellation mania which was so prevalent in the later Middle Ages, when processions of penitents, male and female, eagerly flogged themselves and each other, may have had something to do with the discovery of erotic flagellation, [109] which, at all events in Europe, seems scarcely to have been known before the sixteenth century. It must, in any case, have assisted to create a predisposition. The introduction of flagellation as a definitely

recognized sexual stimulant is by Eulenburg, in his interesting book, *_Sadismus und Masochismus_*, attributed to the Arabian physicians. It would appear to have been by the advice of an Arabian physician that the Duchess Leonora Gonzaga, of Mantua, was whipped by her mother to aid her in responding more warmly to her husband's embraces and to conceive.

Whatever the precise origin of sexual flagellation in Europe, there can be no doubt that it soon became extremely common, and so it remains at the present day. Those who possess a special knowledge of such matters declare that sexual flagellation is the most frequent of all sexual perversions in England.[110] This belief is, I know, shared by many people both inside and outside England. However this may be, the tendency is certainly common. I doubt if it is any or at all less common in Germany, judging by the large number of books on the subject of flagellation which have been published in German. In a catalogue of "interesting books" on this and allied subjects issued by a German publisher and bookseller, I find that, of fifty-five volumes, as many as seventeen or eighteen, all in German, deal solely with the question of flagellation, while many of the other books appear to deal in part with the same subject.[111] It is, no doubt, true that the large part which the rod has played in the past history of our civilization justifies a considerable amount of scientific interest in the subject of flagellation, but it is clear that the interest in these books is by no means always scientific, but very frequently sexual.

It is remarkable that, while the sexual associations of whipping, whether in slight or in marked degrees, are so frequent in modern times, they appear to be by no means easy to trace in ancient times. "Flagellation," I find it stated by a modern editor of the *_Priapeia_*, "so extensively practised in England as a provocation to venery, is almost entirely unnoticed by the Latin erotic writers, although, in the *_Satyricon_* of Petronius (ch. cxxxviii), Encolpius, in describing the steps taken by OEnothea to undo the temporary impotence to which he was subjected, says: 'Next she mixed nasturtium-juice with southern wood, and, having bathed my foreparts, she took a bunch of green nettles, and gently whipped my belly all over below the navel.'" It appears also that many ancient courtesans dedicated to Venus as ex-votos a whip, a bridle, or a spur as tokens of their skill in riding their lovers. The whip was sometimes used in antiquity, but if it aroused sexual emotions they seem to have passed unregarded. "We naturally know nothing," Eulenburg remarks (*_Sadismus und Masochismus_*, p. 72), "of the feelings of the priestess of

Artemis at the flagellation of Spartan youths; or what emotions inspired the priestess of the Syrian goddess under similar circumstances; or what the Roman Pontifex Maximus felt when he castigated the exposed body of a negligent vestal (as described by Plutarch) behind a curtain, and the 'plagosus Orbilius' only practised on children."

It was at the Renaissance that cases of abnormal sexual pleasure in flagellation began to be recorded. The earliest distinct reference to a masochistic flagellant seems to have been made by Pico della Mirandola, toward the end of the fifteenth century, in his *_Disputationes Adversus Astrologiam Divinatricem_*, bk. iii, ch. xxvii. Coelius Rhodiginus in 1516, again, narrated the case of a man he knew who liked to be severely whipped, and found this a stimulant to coitus. Otto Brunfels, in his *_Onomasticon_* (1534), art. "Coitus," refers to another case of a man who could not have intercourse with his wife until he had been whipped. Then, a century later, in 1643, Meibomius wrote *_De Usu Flagrorum in re Venerea_*, the earliest treatise on this subject, narrating various cases. Numerous old cases of pleasure in flagellation and urtication were brought together by Schurig in 1720 in his *_Spermatologia_*, pp. 253-258.

The earliest definitely described medical case of sadistic pleasure in the sight of active whipping which I have myself come across belongs to the year 1672, and occurs in a letter in which Nesterus seeks the opinion of Garmann. He knows intimately, he states, a very learned man--whose name, for the honor he bears him, he refrains from mentioning--who, whenever in a school or elsewhere he sees a boy unbreeched and birched, and hears him crying out, at once emits semen copiously without any erection, but with great mental commotion. The same accident frequently happens to him during sleep, accompanied by dreams of whipping. Nesterus proceeds to mention that this "*_laudatus vir_*" was also extremely sensitive to the odor of strawberries and other fruits, which produced nausea. He was evidently a neurotic subject. (L.C.F. Garmanni et Aliorum Virorum Clarissimorum, *_Epistolarum Centuria_*, Rostochi et Lipsiæ, 1714.)

In England we find that toward the end of the sixteenth century one of Marlowe's epigrams deals with a certain Francus who before intercourse with his mistress "sends for rods and strips himself

stark naked," and by the middle of the seventeenth century the existence of an association between flagellation and sexual pleasure seems to have been popularly recognized. In 1661, in a vulgar "tragicomedy" entitled The Presbyterian Lash, we find: "I warrant he thought that the tickling of the wench's buttocks with the rod would provoke her to lechery." That whipping was well known as a sexual stimulant in England in the eighteenth century is sufficiently indicated by the fact that in one of Hogarth's series representing the "Harlot's Progress" a birch rod hangs over the bed. The prevalence of sexual flagellation in England at the end of that century and the beginning of the nineteenth is discussed by Dühren (Iwan Bloch) in his Geschlechtsleben in England (1901-3), especially vol. ii, ch. vi.

While, however, the evidence regarding sexual flagellation is rare, until recent times whipping as a punishment was extremely common. It is even possible that its very prevalence, and the consequent familiarity with which it was regarded, were unfavorable to the development of any mysterious emotional state likely to act on the sexual sphere, except in markedly neurotic subjects. Thus, the corporal chastisement of wives by husbands was common and permitted. Not only was this so to a proverbial extent in eastern Europe, but also in the extreme west and among a people whose women enjoyed much freedom and honor. Cymric law allowed a husband to chastise his wife for angry speaking, such as calling him a cur; for giving away property she was not entitled to give away; or for being found in hiding with another man. For the first two offenses she had the option of paying him three kine. When she accepted the chastisement she was to receive "three strokes with a rod of the length of her husband's forearm and the thickness of his long finger, and that wheresoever he might will, excepting on the head"; so that she was to suffer pain only, and not injury. (R.B. Holt, "Marriage Laws and Customs of the Cymri," Journal of the Anthropological Institute, August-November, 1898, p. 162.)

"The Cymric law," writes a correspondent, "seems to have survived in popular belief in the Eastern and Middle States of the United States. In police-courts in New York, for example, it has been unsuccessfully pleaded that a man is entitled to beat his wife with a stick no thicker than his thumb. In Pennsylvania actual

acquittals have been rendered."

Among all classes children were severely whipped by their parents and others in authority over them. It may be recalled that in the twelfth century when Abelard became tutor to Heloise, then about 18 years of age, her uncle authorized him to beat her, if negligent in her studies. Even in the sixteenth century Jeanne d'Albert, who became the mother of Henry IV of France, at the age of 13½ was married to the Duke of Cleves, and to overcome her resistance to this union the Queen, her mother, had her whipped to such an extent that she thought she would die of it. The whip on this occasion was, however, only partially successful, for the Duke never succeeded in consummating the marriage, which was, in consequence, annulled. (Cabanès brings together numerous facts regarding the prevalence of flagellation as a chastisement in ancient France in the interesting chapter on "La Flagellation a la Cour et à la Ville" in his *_Indiscretions de l'Histoire_*, 1903.)

As to the prevalence of whipping in England evidence is furnished by Andrews, in the chapter on "Whipping and Whipping Posts," in his book on ancient punishments. It existed from the earliest times and was administered for a great variety of offenses, to men and women alike, for vagrancy, for theft, to the fathers and mothers of illegitimate children, for drunkenness, for insanity, even sometimes for small-pox. At one time both sexes were whipped naked, but from Queen Elizabeth's time only from the waist upward. In 1791 the whipping of female vagrants ceased by law. (W. Andrews, *_Bygone Punishments_*, 1899.)

It must, however, be remarked that law always lags far behind social feeling and custom, and flagellation as a common punishment had fallen into disuse or become very perfunctory long before any change was made in the law, though it is not absolutely extinct, even by law, today. There is even an ignorant and retrograde tendency to revive it. Thus, even in severe Commonwealth days, the alleged whipping with rods of a servant-girl by her master, though with no serious physical injury, produced a great public outcry, as we see by the case of the Rev. Zachary Crofton, a distinguished London clergyman, who was prosecuted in 1657 on the charge of whipping his servant-girl, Mary Cadman, because she lay in bed late in the

morning and stole sugar. This incident led to several pamphlets. In The Presbyterian, Lash or Noctroff's Maid Whipt (1661), a satire on Crofton, we read: "It is not only contrary to Gospel but good manners to take up a wench's petticoats, smock and all"; and in the doggerel ballad of "Bo-Peep," which was also written on the same subject, it is said that Crofton should have left his wife to chastise the maid. Crofton published two pamphlets, one under his own name and one under that of Alethes Noctroff (1657), in which he elaborately dealt with the charge as both false and frivolous. In one passage he offers a qualified defense of such an act: "I cannot but bewail the exceeding rudeness of our times to suffer such foolery to be prosecuted as of some high and notorious crime. Suppose it were (as it is not) true, may not some eminent congregational brother be found guilty of the same act? Is it not much short of drinking an health naked on a signpost? May it not be as theologically defended as the husband's correction of his wife?" This passage, and the whole episode, show that feeling in regard to this matter was at that time in a state of transition.

Flagellation as a penance, whether inflicted by the penitent himself or by another person, was also extremely common in medieval and later days. According to Walsingham ("Master of the Rolls' Collection," vol. i, p. 275), in England, in the middle of the fourteenth century, penitents, sometimes men of noble birth, would severely flagellate themselves, even to the shedding of blood, weeping or singing as they did so; they used cords with knots containing nails.

At a later time the custom of religious flagellation was more especially preserved in Spain. The Countess d'Aulnoy, who visited Spain in 1685, has described the flagellations practised in public at Madrid. After giving an account of the dress worn by these flagellants, which corresponds to that worn in Spain in Holy Week at the present time by the members of the Cofrarias, the face concealed by the high sugar-loaf head-covering, she continues: "They attach ribbons to their scourges, and usually their mistresses honor them with their favors. In gaining public admiration they must not gesticulate with the arm, but only move the wrist and hand; the blows must be given without haste, and the blood must not spoil the costume. They make terrible wounds on their shoulders, from which the blood flows in streams; they

march through the streets with measured steps; they pass before the windows of their mistresses, where they flagellate themselves with marvelous patience. The lady gazes at this fine sight through the blinds of her room, and by a sign she encourages him to flog himself, and lets him understand how much she likes this sort of gallantry. When they meet a good-looking woman they strike themselves in such a way that the blood goes on to her; this is a great honor, and the grateful lady thanks them.... All this is true to the letter."

The Countess proceeds to describe other and more genuine penitents, often of high birth, who may be seen in the street naked above the waist, and with naked feet on the rough and sharp pavement; some had swords passed through the skin of their body and arms, others heavy crosses that weighed them down. She remarks that she was told by the Papal Nuncio that he had forbidden confessors to impose such penances, and that they were due to the devotion of the penitents themselves. (*_Relation du Voyage d'Espagne_*, 1692, vol. ii, pp. 158-164.)

The practice of public self-flagellation in church during Lent existed in Spain and Portugal up to the early years of the nineteenth century. Descriptions of it will often be met with in old volumes of travel. Thus, I find a traveler through Spain in 1786 describing how, at Barcelona, he was present when, in Lent, at a Miserere in the Convent Church of San Felipe Neri on Friday evening the doors were shut, the lights put out, and in perfect darkness all bared their backs and applied the discipline, singing while they scourged themselves, ever louder and harsher and with ever greater vehemence until in twenty minutes' time the whole ended in a deep groan. It is mentioned that at Malaga, after such a scene, the whole church was in the morning sprinkled with blood. (Joseph Townsend, *_A Journey through Spain in 1786_*, vol. i, p. 122; vol. iii, p. 15.)

Even to our own day religious self-flagellation is practised by Spaniards in the Azores, in the darkened churches during Lent, and the walls are often spotted and smeared with blood at this time. (O.H. Howarth, "The Survival of Corporal Punishment," *_Journal Anthropological Institute_*, Feb., 1889.) In remote districts of Spain (as near Haro in Rioja) there are also brotherhoods who will flagellate themselves on Good Friday, but

not within the church. (Dario de Regoyos, *España Negra*, 1899, p. 72.)

When we glance over the history of flagellation and realize that, though whipping as a punishment has been very widespread and common, there have been periods and lands showing no clear knowledge of any sexual association of whipping, it becomes clear that whipping is not necessarily an algolagnic manifestation. It seems evident that there must be special circumstances, and perhaps a congenital predisposition, to bring out definitely the relationship of flagellation to the sexual impulse. Thus, Löwenfeld considers that only about 1 per cent, of people can be sexually excited by flagellation of the buttocks,[112] and Näcke also is decidedly of opinion that there can be no sexual pleasure in flagellation without predisposition, which is rare.[113] On these grounds many are of opinion that physical chastisement, provided it is moderate, seldom applied, and only to children who are quite healthy and vigorous, need not be absolutely prohibited.[114] But, however rare and abnormal a sexual response to actual flagellation may be in adults, we shall see that the general sexual association of whipping in the minds of children, and frequently of their elders, is by no means rare and scarcely abnormal.

What is the cause of the connection between sexual emotion and whipping? A very simple physical cause has been believed by some to account fully for the phenomena. It is known that strong stimulation of the gluteal region may, especially under predisposing conditions, produce or heighten sexual excitement, by virtue of the fact that both regions are supplied by branches of the same nerve.

There is another reason why whipping should exert a sexual influence. As Féré especially has pointed out, in moderate amount it has a tonic effect, and as such has a general beneficial result in stimulating the whole body. This fact was, indeed, recognized by the classic physicians, and Galen regarded flagellation as a tonic.[115] Thus, not only must it be said that whipping, when applied to the gluteal region, has a direct influence in stimulating the sexual organs, but its general tonic influence must naturally extend to the sexual system.

It is possible that we must take into account here a biological factor, such as we have found involved in other forms of sadism and masochism. In this connection a lady writes to me: "With regard to the theory which connects the desire for whipping with the way in which animals make love, where blows or pressure on

the hindquarters are almost a necessary preliminary to pleasure, have you ever noticed the way in which stags behave? Their does seem as timid as the males are excitable, and the blows inflicted on them by the horns of their mates to reduce them to submission must be, I should think, an exact equivalent to being beaten with a stick."

It is remarkable that in some cases the whip would even appear to have a psychic influence in producing sexual excitement in animals accustomed to its application as a stimulant to action. Thus, Professor Cornevin, of Lyons, describes the case of a Hungarian stallion, otherwise quite potent, in whom erection could only be produced in the presence of a mare in heat when a whip was cracked near him, and occasionally applied gently to his legs. (Cornevin, *_Archives d'Anthropologie Criminelle_*, January, 1896.)

Here, undoubtedly, we have a definite anatomical and physiological relationship which often serves as a starting-point for the turning of the sexual feelings in this direction, and will sometimes support the perversion when it has otherwise arisen. But this relationship, even if we regard it as a fairly frequent channel by which sexual emotion is aroused, will not suffice to account for most, or even many, of the cases in which whipping exerts a sexual fascination. In many, if not most, cases it is found that the idea of whipping asserts its sexual significance quite apart from any personal experience, even in persons who have never been whipped;[116] not seldom also in persons who have been whipped and who feel nothing but repugnance for the actual performance, attractive as it may be in imagination.

It is evident that we have to seek the explanation of this phenomenon largely in psychic causes. Whipping, whether inflicted or suffered, tends to arouse, vaguely but massively, the very fundamental and primitive emotions of anger and fear, which, as we have seen, have always been associated with courtship, and it tends to arouse them at an age when the sexual emotions have not become clearly defined, and under circumstances which are likely to introduce sexual associations. From their earliest years children have been trained to fear whipping, even when not actually submitted to it, and an unjust punishment of this kind, whether inflicted on themselves or others, frequently arouses intense anger, nervous excitement, or terror in the sensitive minds of children.[117] Moreover, as has been pointed out to me by a lady who herself in early life was

affected by the sexual associations of whipping, a child only sees the naked body of elder children when uncovered for whipping, and its sexual charm may in part be due to this cause. We further have to remark that the spectacle of suffering itself is, to some extent and under some circumstances, a stimulant of sexual emotion. It is evident that a number of factors contribute to surround whipping at a very early age with powerful emotional associations, and that these associations are of such a character that in predisposed subjects they are very easily led into a sexual channel.[118] Various lines of evidence support this conclusion. Thus, from several reliable quarters I learn that the sight of a boy being caned at school may produce sexual excitement in the boys who look on. The association of sexual emotion with whipping is, again, very liable to show itself in schoolmasters, and many cases have been recorded in which the flogging of boys, under the stress of this impulse, has been carried to extreme lengths. An early and eminent example is furnished by Udall, the humanist, at one time headmaster of Eton, who was noted for his habit of inflicting frequent corporal punishment for little or no cause, and who confessed to sexual practices with the boys under his care.[119]

Sanitchenko has called attention to the case of a Russian functionary, a school inspector, who every day had some fifty pupils flogged in his presence, as evidence of a morbid pleasure in such scenes. Even when no sexual element can be distinctly traced, scenes of whipping sometimes exert a singular fascination on some persons of sensitive emotional temperament. A friend, a clergyman, who has read many novels tells me that he has been struck by the frequency with which novelists describe such scenes with much luxury of detail; his list includes novels by well-known religious writers of both sexes. In some of these cases there is reason to believe that the writers felt this sexual association of whipping.

It is natural that an interest in whipping should be developed very early in childhood, and, indeed, it enters very frequently into the games of young children, and constitutes a much relished element of such games, more especially among girls. I know of many cases in which young girls between 6 and 12 years of age took great pleasure in games in which the chief point consisted in unfastening each other's drawers and smacking each other, and some of these girls, when they grew older, realized that there was an element of sexual enjoyment in their games. It has indeed, it seems, always been a child's game, and even an amusement of older persons, to play at smacking each other's nates. In *The Presbyter's Lash* in 1661 a young woman is represented as stating that she had done this as a child, and in ancient France it was a privileged custom on Innocents' Day

(December 28th) to smack all the young people found lying late in bed; it was a custom which, as Clement Marot bears witness, was attractive to lovers.

If we turn to the histories I have brought together in Appendix B we find various references to whipping more or less clearly connected with the rudimentary sexual feelings of childhood.

I am acquainted with numerous cases in which the idea of whipping, or the impulse to whip or be whipped, distinctly exists, though usually, when persisting to adult life, only in a rudimentary form. History I in the Appendix B presents a well-marked instance. I may quote the remarks in another case of a lady regarding her early feelings: "As a child the idea of being whipped excited me, but only in connection with a person I loved, and, moreover, one who had the right to correct me. On one occasion I was beaten with the back of a brush, and the pain was sufficient to overcome any excitement; so that, ever after, this particular form of whipping left me unaffected, though the excitement still remained connected with forms of which I had no experience."

Another lady states that when a little girl of 4 or 5 the servants used to smack her nates with a soft brush to amuse themselves (undoubtedly, as she now believes, this gave them a kind of sexual pleasure); it did not hurt her, but she disliked it. Her father used to whip her severely on the nates at this age and onward to the age of 13, but this never gave her any pleasure. When, however, she was about 9 she began in waking dreams to imagine that she was whipping somebody, and would finish by imagining that she was herself being whipped. She would make up stories of which the climax was a whipping, and felt at the same time a pleasurable burning sensation in her sexual parts; she used to prolong the preliminaries of the story to heighten the climax; she felt more pleasure in the idea of being whipped than of whipping, although she never experienced any pleasure from an actual whipping. These day-dreams were most vivid when she was at school, between the ages of 11 and 14. They began to fade with the growth of affection for real persons. But in dreams, even in adult life, she occasionally experienced sexual excitement accompanied by images of smacking.

Another correspondent, this time a man, writes: "I experienced the connection between sexual excitement and whipping long before I knew what sexuality meant or had any notion regarding the functions of the sexual organs. What I now know to be distinct sexual feeling used to occur whenever the idea of whipping arose or the mention of whipping was made in a way to arrest my attention. I well remember the strange, mysterious fascination it had, even apart from any actual physical excitement. I have been told by many men and a few women that it was the same with them. Even now the feeling exists sometimes, especially when reading about whipping."

The following confession, which I find recorded by a German manufacturer's wife, corresponds with those I have obtained in England: "When about 5 years old I was playing with a little girl friend in the park. Our governesses sat on a bench talking. For some reason--perhaps because we had wandered away too far and failed to hear a call to return--my friend aroused the anger of the governess in charge of her. That young lady, therefore, took her aside, raised her dress, and vigorously smacked her with the flat hand. I looked on fascinated, and possessed by an inexplicable feeling to which I naïvely gave myself up. The impression was so deep that the scene and the persons concerned are still clearly present to my mind, and I can even recall the little details of my companion's underclothing." When sexual associations are permanently brought into play through such an early incident it is possible that a special predisposition exists. (*Gesellschaft und Geschlecht*, Bd. ii, ht. 4, p. 120.)

It would certainly seem that we must look upon this association as coming well within the normal range of emotional life in childhood, although after puberty, when the sexual feelings become clearly defined, the attraction of whipping normally tends to be left behind as a piece of childishness, only surviving in the background of consciousness, if at all, to furnish a vaguely sexual emotional tone to the subject of whipping, but not affecting conduct, sometimes only emerging in erotic dreams.

This, however, is not invariably the case in persons who are organically abnormal. In such cases, and especially, it would seem, in highly sensitive and emotional children, the impress left by the fact or the image of whipping may be so strong that it affects not only definitely,

but permanently, the whole subsequent course of development of the sexual impulse. Régis has recorded a case which well illustrates the circumstances and hereditary conditions under which the idea of whipping may take such firm root in the sexual emotional nature of a child as to persist into adult life; at the same time the case shows how a sexual perversion may, in an intelligent person, take on an intellectual character, and it also indicates a rational method of treatment.

Jules P., aged 22, of good heredity on father's side, but bad on that of mother, who is highly hysterical, while his grandmother was very impulsive and sometimes pursued other women with a knife. He has one brother and one sister, who are somewhat morbid and original. He is himself healthy, intelligent, good looking, and agreeable, though with slightly morbid peculiarities. At the age of 4 or 5 he suddenly opened a door and saw his sister, then a girl of 14 or 15, kneeling, with her clothes raised and her head on her governess's lap, at the moment of being whipped for some offense. This trivial incident left a profound impression on his mind, and he recalls every detail of it, especially the sight of his sister's buttocks,--round, white, and enormous as they seemed to his childish eyes,--and that momentary vision gave a permanent direction to the whole of his sexual life. Always after that he desired to touch and pat his sister's gluteal regions. He shared her bed, and, though only a child, acquired great skill in attaining his ends without attracting her attention, lifting her night-gown when she slept and gently caressing the buttocks, also contriving to turn her over on to her stomach and then make a pillow of her hips. This went on until the age of 7, when he began to play with two little girls of the neighborhood, the eldest of whom was 10; he liked to take the part of the father and whip them. The older girl was big for her age, and he would separate her drawers and smack her with much voluptuous emotion; so that he frequently sought opportunities to repeat the experience, to which the girl willingly lent herself, and they were constantly together in dark corners, the girl herself opening her drawers to enable him to caress her thighs and buttocks with his hand until he became conscious of an erection. Sometimes he would gently use a whip. On one occasion she asked him if he would not now like to see her in front, but he declined.

One day, when 8 or 9 years old, being with a boy companion, he

came upon a picture of a monk being flagellated, and thereupon persuaded his companion to let himself be whipped; the boy enjoyed the experience, which was therefore often repeated. Jules P. himself, however, never took the slightest pleasure in playing the passive part. These practices were continued even after the friend became a conscript, when, however, they became very rare. Only once or twice has he ever done anything of this kind to girls who were strangers to him. Nor has he ever masturbated or had any desire for sexual intercourse. He contents himself with the pleasure of being occasionally able to witness scenes of whipping in public places--parks and gardens--or of catching glimpses of the thighs and buttocks of young girls or, if possible, women.

His principal enjoyment is in imagination. From the first he has loved to invent stories in which whippings were the climax, and at 13 such stories produced the first spontaneous emission. Thus, he imagines, for instance, a young girl from the country who comes up to Paris by train; on the way a lady is attracted by her, takes an interest in her, brings her home to dinner, and at last can no longer resist the temptation to take the girl in her arms and whip her amorously. He writes out these scenes and illustrates them with drawings, many of which Régis reproduces. He has even written comedies in which whipping plays a prominent part. He has, moreover, searched public libraries for references to flagellation, inserted queries in the Intermédiaire des Chercheurs et des Curieux, and thus obtained a complete bibliography of flagellation which is of considerable value. Régis is acquainted with these Archives de la Fessée, and states that they are carried on with great method and care. He is especially interested in the whipping of women by women. He considers that the pleasure of whippings should always be shared by the person whipped, and he is somewhat concerned to find that he has an increasing inclination to imagine an element of cruelty in the whipping. Emissions are somewhat frequent. According to the latest information, he is much better; he has entered into sexual relationship with a woman who is much in love with him, and to whom he has confided his peculiarities. With her aid and suggestions he has been able to have intercourse with her, at the moment of coitus whipping her with a harmless India-rubber tube. (E. Régis, "Un Cas de Perversion Sexuelle, a forme Sadique," Archives d'Anthropologie Criminelles, July, 1899.)

In a case also occurring in a highly educated man (narrated by Marandon de Montyel) a doctor of laws, brilliantly intellectual and belonging to a family in which there had been some insanity, when at school at the age of 11, saw for the first time a schoolfellow whipped on the nates, and experienced a new pleasure and emotion. He was never himself whipped at school, but would invent games with his sisters and playfellows in which whipping formed an essential part. At the age of 13 he teased a young woman, a cook, until she seized him and whipped him. He put his arms around her and experienced his first voluptuous spasm of sex. The love of flagellation temporarily died out, however, and gave place to masturbation and later to a normal attraction to women. But at the age of 32 the old ideas were aroused anew by a story his mistress told him. He suffered from various obsessions and finally committed suicide. (Marandon de Montyel, "Obsessions et Vie Sexuelle," *_Archives de Neurologie_*, Oct., 1904.)

In a case that has been reported to me, somewhat similar ideas played a part. The subject is a tall, well-developed man, aged 28, delicate in childhood, but now normal in health and physical condition, though not fond of athletics. His mental ability is much above the average, especially in scientific directions; he was brought up in narrow and strict religious views, but at an early age developed agnostic views of his own.

From the age of 6, and perhaps earlier, he practised masturbation almost every night. This was a habit which he carried on in all innocence. It was as invariable a preliminary, he states, to going to sleep as was lying down, and at this period he would have felt no hesitation in telling all about it had the question been asked. At the age of 12 or 13 he recognized the habit as abnormal, and fear of ridicule then caused him to keep silence and to avoid observation. In carrying it out he would lie on his stomach with the penis directed downward, and not up, and the thumb resting on the region above the root of the penis. There was desire for micturition after the act, and when that was satisfied sound sleep followed. When he realized that the habit was abnormal he began to make efforts to discontinue it, and these efforts have been continued up to the present. The chief obstacle has been the difficulty of sleep without carrying out the practice. Emissions first began to occur at the age of 13 and

at first caused some alarm. During the six following years indulgence was irregular, sometimes occurring every other night and sometimes with a week's intermission. Then at the age of 19 the habit was broken for a year, during which nocturnal emissions took place during sleep about every three weeks. Since this, shorter periods of non-indulgence have occurred, these periods always coinciding with unusual mental or physical strain, as of examinations. He has some degree of attraction for women; this is strongest during cessation from masturbation and tends to disappear when the habit is resumed. He has never had sexual intercourse because he prefers his own method of gratification and feels great abhorrence for professional prostitutes; he could not afford to marry. Any indecency or immorality, except (he observes) his own variety, disgusts him.

At the earliest period no mental images accompanied the act of masturbation. At about the age of 8, however, sexual excitement began to be constantly associated with ideas of being whipped. At or soon after this age only the fear of disgrace prevented him from committing serious childish offenses likely to be punished by a good whipping. Parents and masters, however, seem to have used corporal punishment very sparingly.

At first this desire was for whipping in general, without reference to the operator. Soon after the age of 10, however, he began to wish that certain boy friends should be the operators. At about the same time definite desire arose for closer contact with these friends and later for definite indecent acts which, however, the subject failed to specify; he probably meant mutual masturbation. These desires were under control, and the fear of ridicule seems to have been the chief restraining cause. At about the age of 15 he began to realize that such acts might be considered morally bad and wrong, and this led to reticence and careful concealment. Up to the age of 20 there were four definite attachments to persons of his own sex. There was a tendency, sometimes, to regard women as possible whippers, and this became stronger at 22, the images of the two sexes then mingling in his thoughts of flagellation. Latterly the mental accompaniments of masturbation have been less personal, lapsing into the mental picture of being whipped by an unknown and vague somebody. When definite it has always been a man, and preferably of the type of a schoolmaster. His desire has been for punishment by whips,

canes, or birches, especially upon the buttocks. He has always shrunk from the thought of the production of blood or bruises. He wishes, in mental contemplation, for a punishment sufficiently severe to make him anxious to stop it, and yet not able to stop it. He also takes pleasure in the idea of being tied up so as to be unable to move.

He has at times indulged in self-whipping, of no great severity.

In the preceding case we see a tendency to erotic self-flagellation which in a minor degree is not uncommon. Occasionally it becomes highly developed. Max Marcuse has presented such a case in elaborate detail (*_Zeitschrift für die Gesamte Neurologie_*, 1912, ht. 3, fully summarized in *_Sexual-Probleme_*, Nov., 1912, pp. 815-820). This is the case of a Catholic priest of highly neurotic heredity, who spontaneously began to whip himself at the age of 12, this self-flagellation being continued and accompanied by masturbation after the age of 15. Other associated perversions were Narcissism and nates fetichism, as well as homosexual phantasies. He experienced a certain pleasure (with erection, not ejaculation) in punishing his boy pupils. It is not uncommon for all forms of erotic flagellation to be associated with a homosexual element. I have elsewhere brought forward a case of this kind (the case of A.F., vol. ii of these *_Studies_*).

Significant is Rousseau's account of the origin of his own masochistic pleasure in whipping at the age of 8: "Mademoiselle Lambercier showed toward me a mother's affection and also a mother's authority, which she sometimes carried so far as to inflict on us the usual punishment of children when we had deserved it. For a long time she was content with the threat, and that threat of a chastisement which for me was quite new seemed very terrible; but after it had been executed I found the experience less terrible than the expectation had been; and, strangely enough, this punishment increased my affection for her who had inflicted it. It needed all my affection and all my natural gentleness to prevent me from seeking a renewal of the same treatment by deserving it, for I had found in the pain and even in the shame of it an element of sensuality which left more desire than fear of receiving the experience again from the same hand. It is true that, as in all this a precocious sexual element

was doubtless mixed, the same chastisement if inflicted by her brother would not have seemed so pleasant." He goes on to say that the punishment was inflicted a second time, but that that time was the last, Mademoiselle Lambercier having apparently noted the effects it produced, and, henceforth, instead of sleeping in her room, he was placed in another room and treated by her as a big boy. "Who would have believed," he adds, "that this childish punishment, received at the age of 8 from the hand of a young woman of 30, would have determined my tastes, my desires, my passions, for the rest of my life?" He remarks that this strange taste drove him almost to madness, but maintained the purity of his morals, and the joys of love existed for him chiefly in imagination. (J.J. Rousseau, *Les Confessions*, partie i, livre i.) It will be seen how all the favoring conditions of fear, shame, and precocious sexuality were here present in an extremely sensitive child destined to become the greatest emotional force of his century, and receptive to influences which would have had no permanent effect on any ordinary child. (When, as occasionally happens, the first sexual feelings are experienced under the stimulation of whipping in normal children, no permanent perversion necessarily follows; Moll mentions that he knows such cases, *Zeitschrift für Pädagogie, Psychiatrie, und Pathologie*, 1901.) It may be added that it is, perhaps, not fanciful to see a certain inevitableness in the fact that on Rousseau's highly sensitive and receptive temperament it was a masochistic germ that fell and fructified, while on Régis's subject, with his more impulsive ancestral antecedents, a sadistic germ found favorable soil.

It may be noted that in Régis's sadistic case the little girl who was the boy's playmate found scarcely less pleasure in the passive part of whipping than he found in the active. There is ample evidence to show that this is very often the case, and that the attractiveness of the idea of being whipped often even arises spontaneously in children. Lombroso (*La Donna Delinquente*, p. 404) refers to a girl of 7 who had voluptuous pleasure in being whipped, and Hammer (*Monatschrift für Harnkrankheiten*, 1906, p. 398) speaks of a young girl who similarly experienced pleasure in punishment by whipping. Krafft-Ebing records the case of a girl of between 6 and 8 years of age, never at that time having been whipped or seen anyone else whipped, who spontaneously acquired--how she did not know--the desire to be castigated in

this manner. It gave her very great pleasure to imagine a woman friend doing this to her. She never desired to be whipped by a man, though there was no trace of inversion, and she never masturbated until the age of 24, when a marriage engagement was broken off. At the age of 10 this longing passed away before it was ever actually realized. (Krafft-Ebing, *_Psychopathia Sexualis_*, eighth edition, p. 136.)

In the case of another young woman described by Krafft-Ebing--where there was neurasthenia with other minor morbid conditions in the family, but the girl herself appears to have been sound--the desire to be whipped existed from a very early age. She traced it to the fact that when she was 5 years old a friend of her father's playfully placed her across his knees and pretended to whip her. Since then she has always longed to be caned, but to her great regret the wish has never been realized. She longs to be the slave of a man whom she loves: "Lying in fancy before him, he puts one foot on my neck while I kiss the other. I revel in the idea of being whipped by him and imagine different scenes in which he beats me. I take the blows as so many tokens of love; he is at first extremely kind and tender, but then in the excess of his love he beats me. I fancy that to beat me for love's sake gives him the highest pleasure." Sometimes she imagines that she is his slave, but not his female slave, for every woman may be her husband's slave. She is of proud and independent nature in all other matters, and to imagine herself a man who consents to be a slave gives her a more satisfying sense of humiliation. She does not understand that these manifestations are of a sexual nature. (Krafft-Ebing, *_Psychopathia Sexualis_*, English translation of tenth edition, p. 189.)

Sometimes a woman desires to take the active part in whipping. Thus Marandon de Montyel records the case of a girl of 19, hereditarily neuropathic (her father was alcoholic), but very intelligent and good-hearted, who had never been whipped or seen anyone whipped. At this age, however, she happened to visit a married friend who was just about to punish her boy of 9 by whipping him with a wet towel. The girl spectator was much interested, and though the boy screamed and struggled she experienced a new sensation she could not define. "At every stroke," she said, "a strange shiver went through all my body

from my brain to my heels." She would like to have whipped him herself and felt sorry when it was over. She could not forget the scene and would dream of herself whipping a boy. At last the desire became irresistible and she persuaded a boy of 12, whom she was very fond of, and who was much attached to her, to let her whip him on the naked nates. She did this so ferociously that he at last fainted. She was overcome by grief and remorse. (Marandon de Montyel, *_Archives d'Anthropologie Criminelle_*, Jan., 1906, p. 30.)

Although masochism in a pronounced degree may be said to be rare in women, the love of active flagellation, and sadistic impulses generally are not uncommon among them. Bloch believes they are especially common among English women. Cases occur from time to time of extreme harshness, cruelty, degrading punishment, and semi-starvation inflicted upon children. The accused are most usually women, and when a man and woman in conjunction are accused it appears generally to have been the woman who played the more active part. But it is rarely demonstrated in these cases that the cruelty exercised had a definite sexual origin. There is nothing, for instance, to indicate true sadism in the famous English case in the eighteenth century of Mrs. Brownrigg (Bloch, *_Geschlechtsleben in England_*, vol. ii, p. 425). It may well be, however, in many of these cases that the real motive is sexual, although latent and unconscious. The normal sexual impulse in women is often obscured and disguised, and it would not be surprising if the perverse instinct is so likewise.

It is noteworthy that a passion for whipping may be aroused by contact with a person who desires to be whipped. This is illustrated by the following case which has been communicated to me: "K. is a Jew, about 40 years of age, apparently normal. Nothing is known of his antecedents. He is a manufacturer with several shops. S., an Englishwoman, aged 25, entered his service; she is illegitimate, believed to have been reared in a brothel kept by her mother, is prepossessing in appearance. On entering K.'s service S. was continually negligent and careless. This so provoked K. that on one occasion he struck her. She showed great pleasure and confessed that her blunder had been deliberately intended to arouse him to physical violence. At her suggestion K. ultimately consented to thrash her. This operation took place in K.'s office, S. stripping for the purpose, and the leather

driving band from a sewing-machine was used. S. manifested unmistakable pleasure during the flagellation, and connection occurred after it. These thrashings were repeated at frequent intervals, and K. found a growing liking for the operation on his own part. Once, at the suggestion of S., a girl of 13 employed by K. was thrashed by both K. and S. alternately. The child complained to her parents and K. made a money payment to them to avoid scandal, the parents agreeing to keep silence. Other women (Jewish tailoresses) employed by K. were subsequently thrashed by him. He asserts that they enjoyed the experience. Mrs. K., discovering her husband's infatuation for S., commenced divorce proceedings. S. consented to leave the country at K.'s request, but returned almost immediately and was kept in hiding until the decree was granted. The mutual infatuation of K. and S. continues, though K. asserts that he cares less for her than formerly. Flagellation has, however, now become a passion with him, though he declares that the practice was unknown to him before he met S. His great fear is that he will kill S. during one of these operations. He is convinced that S. is not an isolated case, and that all women enjoy flagellation. He claims that the experiences of the numerous women whom he has now thrashed bear out this opinion; one of them is a wealthy woman separated from her husband, and is now infatuated with K."

Flagellation, more especially in its masochistic form, is sometimes associated with true inversion. Moll presents the case of a young inverted woman of 26, showing, indeed, many other minor sexual anomalies, who is sexually excited when beaten with a switch. A whip would not do, and the blows must only be on the nates; she cannot imagine being beaten by a small woman. She has often in this way been beaten by a friend, who should be naked at the time, and must submit afterward to cunnilinctus. (Moll, Konträre Sexualempfindung third edition, p. 568.)

In the preceding case there were no masochistic ideas; it is likely that in such a case beating is desired largely on account of that purely physical effect to which attention has already been called. In the same way self-beating with a switch or whip has sometimes been spontaneously discovered as a method of self-excitement preliminary to masturbation. I am acquainted with a lady of much intellectual ability, sexually normal, who made this discovery at the age of 18, and practised it for a time.

Professor Reverdin, also, speaks of the case of a young girl under his care who, after having exhausted all the resources of her intelligence, finally discovered that the climax of enjoyment was best reached by violently whipping her own buttocks and thighs. She had invented for this purpose a whip composed of twelve cords each of which terminated in a large chestnut-burr provided with its spines. (A. Reverdin, *_Revue Médicale de la Suisse Romande_*, January 20, 1888, p. 17.)

FOOTNOTES:

[107] The discipline or scourge was classed with fasting as a method of mastering the flesh and of penance. See, e.g., Lea, *_History of Auricular Confession_*, vol. ii, p. 122. For many centuries bishops and priests used themselves to apply the discipline to their penitents. At first it was applied to the back; later, especially in the case of female penitents, it was frequently applied to the nates. Moreover, partial or complete nudity came to be frequently demanded, the humiliation thereby caused being pleasant in the sight of God.

[108] Dulaure, *_Des Divinités Génératrices_*, ch. xv; Lea, *_History of Sacerdotal Celibacy_*, 3d ed., vol. ii, p. 278; Kiernan, "Asceticism as an Auto-erotism," *_Alienist and Neurologist_*, Aug., 1911.

[109] This is the opinion of Löwenfeld, *_Ueber die Sexuelle Konstitution_*, p. 43.

[110] Thus, Dühren (Iwan Bloch) remarks (*_Der Marquis de Sade und Seine Zeit_*, 1901, p. 211): "It is well known that England is today the classic land of sexual flagellation." See the same author's *_Geschlechtsleben in England_*, vol. ii, ch. vi. In America it appears also to be common, and Kiernan mentions that in advertisements of Chicago "massage shops" there often appears the announcement: "Flagellation a Specialty." The reports of police inspectors in eighteenth century France show how common flagellation then was in Paris. It may be added that various men of distinguished intellectual ability of recent times and earlier are reported as addicted to passive flagellation; this was the case with Helvétius.

[111] A full bibliography of flagellation would include many hundred items. The more important works on this subject, in connection with the

sexual impulse, are enumerated by Eulenburg, in his *_Sadismus und Masochismus_*. An elaborate history of flagellation generally is now being written by Georg Collas, *_Geschichte des Flagellantismus_*, vol. i, 1912.

[112] Löwenfeld, *_Ueber die Sexuelle Konstitution_*, p. 43.

[113] *_Archiv für Kriminal-Anthropologie_*, 1909, p. 361. He brings forward the evidence of a reliable and cultured man who at one time sought to obtain the pleasures of passive sexual flagellation. But in spite of his expectation and good will the only result was to disperse every trace of sexual desire.

[114] E.g., Kiefer, *_Zeitschrift für Sexualwissenschaft_*, Aug., 1908.

[115] Féré, *_Revue de Médecine_*, August, 1900. In this paper Féré brings together many interesting facts concerning flagellation in ancient times.

[116] Schmidt-Heuert (*_Monatschrift für Harnkrankheiten_*, 1906, ht. 7) argues that it is not so much the actual use of the rod as playful, threatening and mysterious suggestions playing around it which nowadays gives it sexual fascination.

[117] Moll (*_Untersuchungen über die Libido Sexualis_*, Bd. 1, p. 18) points out that these emotions frequently suffice to cause sexual emissions in schoolboys.

[118] As Eulenburg truly points out, the circumstances attending the whipping of a woman may be sexually attractive, even in the absence of any morbid impulse. Such circumstances are "the sight of naked feminine charms and especially--in the usual mode of flagellation--of those parts which possess for the sexual epicure a peculiar esthetic attraction; the idea of treating a loved, or at all events desired, person as a child, of having her in complete subjection and being able to dispose of her despotically; and finally the immediate results of whipping: the changes in skin-color, the to and fro movements which simulate or anticipate the initial phenomena of coitus." (Eulenburg, *_Sexuale Neuropathie_*, p. 121.)

IV.

The Impulse to Strangle the Object of Sexual Desire--The Wish to be Strangled--Respiratory Disturbance the Essential Element in this Group of Phenomena--The Part Played by Respiratory Excitement in the Process of Courtship--Swinging and Suspension--The Attraction Exerted by the Idea of being Chained and Fettered.

There is another impulse which it may be worth while to consider briefly here, for the sake of the light it throws on the relationship between love and pain. I allude to the impulse to strangle the object of sexual desire, and to the corresponding craving to be strangled. Cases have been recorded in which this impulse was so powerful that men have actually strangled women at the moment of coitus.[120] Such cases are rare; but, as a mere idea, the thought of strangling a woman appears to be not infrequently associated with sexual emotion. We must probably regard it as, in the main,--with whatever subsidiary elements,--an aspect of that physical seizure, domination, and forcible embrace of the female which is one of the primitive elements of courtship.[121]

The corresponding idea--the pleasurable connection of the thought of being strangled with sexual emotion--appears to occur still more frequently, perhaps especially in women. Here we seem to have, as in the case of whipping, a combination of a physical with a psychic element. Not only is the idea attractive, but, as a matter of fact, strangulation, suffocation, or any arrest of respiration, even when carried to the extent of producing death, may actually provoke emission, as is observed after death by hanging.[122] It is noteworthy that, as Eulenburg remarks, the method of treating diseases of the spinal cord by suspension--a method much in vogue a few years ago--often produced sexual excitement.[123] In brothels, it is said, some of the clients desire to be suspended vertically by a cord furnished with pads.[124] A playful attempt to throttle her on the part of her lover is often felt by a woman as pleasurable, though it may not necessarily produce definite sexual excitement. Sometimes, however, this feeling becomes so strong that it must be regarded as an actual perversion, and I have been told of a woman who is indifferent to the ordinary sexual embrace; her chief longing is to be throttled, and she will do anything to have her neck squeezed by her lover till her eyeballs bulge.[125]

"I think if I could be left my present feelings," a lady writes,

"and be changed into a male imbecile,--that is, given a man's strength, but deprived, to a large extent, of reasoning power,--I might very likely act in the apparently cruel way they do. And this partly because many of their actions appeal to me on the passive side. The idea of being _strangled_ by a person I love does. The great sensitiveness of one's throat and neck come in here as well as the loss of breath. Once when I was about to be separated from a man I cared for I put his hands on my throat and implored him to kill me. It was a moment of madness, which helps me to understand the feelings of a person always insane. Even now that I am cool and collected I know that if I were deeply in love with a man who I thought was going to kill me, especially in that way, I would make no effort to save myself beforehand, though, of course, in the final moments nature would assert herself without my volition. What makes the horror of such cases in insanity is the fact of the love being left out. But I think I find no greater difficulty in picturing the mental attitude of a sadistic lunatic than that of a normal man who gets pleasure out of women for whom he has no love."

The imagined pleasure of being strangled by a lover brings us to a group of feelings which would seem to be not unconnected with respiratory elements. I refer to the pleasurable excitement experienced by some in suspension, swinging, restraint, and fetters. Strangulation is the extreme and most decided type of this group of imagined or real situations, in all of which a respiratory disturbance seems to be an essential element.[126]

In explaining these phenomena we have to remark that respiratory excitement has always been a conspicuous part of the whole process of tumescence and detumescence, of the struggles of courtship and of its climax, and that any restraint upon respiration, or, indeed, any restraint upon muscular and emotional activity generally, tends to heighten the state of sexual excitement associated with such activity.

I have elsewhere, when studying the spontaneous solitary manifestation of the sexual instinct (_Auto-erotism_, in vol. i of these _Studies_), referred to the pleasurable emotional, and sometimes sexual, effects of swinging and similar kinds of movement. It is possible that there is a certain significance in the frequency with which the eighteenth-century French painters, who lived at a time when the refinements of sexual emotion were carefully sought out, have painted women in the act of swinging.

Fragonard mentions that in 1763 a gentleman invited him into the country, with the request to paint his mistress, especially stipulating that she should be depicted in a swing. The same motive was common among the leading artists of that time. It may be said that this attitude was merely a pretext to secure a vision of ankles, but that result could easily have been attained without the aid of the swing.

I may here quote, as bearing on this and allied questions, a somewhat lengthy communication from a lady to whom I am indebted for many subtle and suggestive remarks on the whole of this group of manifestations:--

"With regard to the connection between swinging and suspension, perhaps the physical basis of it is the loss of breath. Temporary loss of breath with me produces excitement. Swinging at a height or a fall from a height would cause loss of breath; in a state of suspension the imagination would suggest the idea of falling and the attendant loss of breath. People suffering from lung disease are often erotically inclined, and anesthetics affect the breathing. Men also seem to like the idea of suspension, but from the active side. One man used to put his wife on a high swinging shelf when she displeased him, and my husband told me once he would like to suspend me to a crane we were watching at work, though I have never mentioned my own feeling on this point to him. Suspension is often mentioned in descriptions of torture. Beatrice Cenci was hung up by her hair and the recently murdered Queen of Korea was similarly treated. In Tolstoi's *My Husband and I* the girl says she would like her husband to hold her over a precipice. That passage gave me great pleasure.[127]

"The idea of slipping off an inclined plane gives me the same sensation. I always feel it on seeing Michael Angelo's 'Night,' though the slipping look displeases me artistically. I remember that when I saw the 'Night' first I did feel excited and was annoyed, and it seemed to me it was the slipping-off look that gave it; but I think I am now less affected by that idea. Certain general ideas seem to excite one, but the particular forms under which they are presented lose their effect and have to be varied. The sentence mentioned in Tolstoi leaves me now quite cold, but if I came across the same idea elsewhere, expressed differently, then it would excite me. I am very capricious in the small

things, and I think women are so more than men. The idea of slipping down a plank formerly produced excitement with me; now it has a less vivid effect, though the idea of loss of breath still produces excitement. The idea of the plank does not now affect me unless there is a certain amount of drapery. I think, therefore, that the feeling must come in part from the possibility of the drapery catching on some roughness of the surface of the slope, and so producing pressure on the sexual organs. The effect is still produced, however, even without any clothing, if the slope is supposed to end in a deep drop, so that the idea of falling is strongly presented. I cannot recollect any early associations that would tend to explain these feelings, except that jumping from a height, which I used frequently to do as a child, has a tendency to create excitement.

"With me, I may add, it is when I cannot express myself, or am trying to understand what I feel is beyond my grasp, that the first stage of sexual excitement results. For instance, I never get excited in thinking over sexual questions, because my ideas, correct or incorrect, are fairly clear and definite. But I often feel sexually excited over that question of the inheritance of acquired characteristics, not because I can't decide between the two sets of evidence, but because I don't feel confident of having fully grasped the true significance of either. This feeling of want of power, mental or physical, always has the same effect. I feel it if my eyes are blindfolded or my hands tied. I don't like to see the Washington Post dance, in which the man stands behind the woman and holds her hands, on that account. If he held her wrists the feeling would be stronger, as her apparent helplessness would be increased. The nervous irritability that is caused by being under restraint seems to manifest itself in that way, while in the case of mental disability the excitement, which should flow down a mental channel, being checked, seems to take a physical course instead.

"Possibly this would help to explain masochistic sexual feelings. A physical cause working in the present would be preferable as an explanation to a psychological cause to be traced back through heredity to primitive conditions. I believe such feelings are very common in men as well as in women, only people do not care to admit them, as a rule."

The idea of being chained and fettered appears to be not uncommonly associated with pleasurable sexual feelings, for I have met with numerous cases in both men and women, and it not infrequently coexists with a tendency to inversion. It often arises at a very early age, and it is of considerable interest because we cannot account for its frequency by any chance association nor by any actual experiences. It would appear to be a purely psychic fantasia founded on the elementary physical fact that restraint of emotion, like suspension, produces a heightening of emotion. In any case the spontaneous character of such ideas and emotions in children of both sexes suffices to show that they must possess a very definite organic basis.

In one of the histories (X) contained in Appendix B at the end of the present volume a lady describes how, as a child, she reveled in the idea of being chained and tortured, these ideas appearing to rise spontaneously. In another case, that of A.N. (for the most part reproduced in "Erotic Symbolism," in vol. v of these Studies), whose ideals are inverted and who is also affected by boot-fetichism, the idea of fetters is very attractive. In this case self-excitement was produced at a very early age, without the use of the hands, by strapping the legs together. We can, however, scarcely explain away the idea of fetters in this case as merely the result of an early association, for it may well be argued that the idea led to this method of self-excitement. "The mere idea of fetters," this subject writes, "produces the greatest excitement, and the sight of pictures representing such things is a temptation. The reading of books dealing with prison life, etc., anywhere where physical restraint is treated of, is a temptation. The temptation is aggravated when the picture represents the person booted. I suppose all this will have been intensified in my case by my practices as a child. But why should a child of 6 do such things unless it were a natural instinct in him? Nobody showed me; I have never mentioned such things to anyone. I used to read historical romances for the pleasure of reading of people being put in prison, in fetters, and tortured, and always envied them. I feel now that I should like to undergo the sensation. If I could get anyone to humor me without losing their self-respect, I should jump at the opportunity. I have been most powerfully excited by visiting an old Australian convict-ship, where all the means of restraint are shown; I have been attracted to it night after night, wanting, but not daring to ask, to be allowed to have a practical experience."

Stcherbak, of Warsaw, has recorded a case which resembles that of A.N., but there was no inversion and the attraction of fetters was active rather than passive; the subject desired to fether and not to be fettered. It is possible that this difference is not fundamental, though Stcherbak regards the case as one of fetichism of sadistic origin ("Contribution à l'Etude des Perversions Sexuelles," *_Archives de Neurologie_*, Oct., 1907). The subject was a highly intelligent though neurasthenic youth, who from the age of 5 had been deeply interested in criminals who were fettered and sent to prison. The fate of Siberian prisoners was a frequent source of prolonged meditations. It was the fettering which alone interested him, and he spent much time in trying to imagine the feelings of the fettered prisoners, and he often imagined that he was himself a prisoner in fetters. (This seems to indicate that the impulse was in its origin masochistic as much as sadistic, and better described as algolagnia than as sadism.) He delighted in stories and pictures of fettered persons. At the age of 15 the sex of the fettered person became important and he was interested chiefly in fettered women. A new element also appeared; he was attracted to well-dressed women and especially to those wearing elegant shoes, delighting to imagine them fettered. He fastened his own feet together with chains, attempting to walk about his room in this condition, but experienced comparatively little pleasure in this way. At the age of 15 he met a lady 10 years older than himself and of great intelligence. As he began to know her more intimately she allowed him to take liberties with her; he fastened her hands behind her back, and this caused him a violent but delicious emotion which he had never experienced before. Next time he fastened her feet together as well as her hands; as he did so her shoes slightly touched his sexual organs; this caused erection and ejaculation, accompanied by the most acute sexual pleasure he had ever felt. He had no wish to see her naked or to uncover himself, and as long as this relationship lasted he had no abnormal thoughts at other times, or in connection with other people. He never masturbated, and his sexual dreams were of fettered men or women. Stcherbak discusses the case at length and considers that it is essentially an example of sadism, on the ground that the impulse of fettering was prompted by the desire to humiliate. There is, however, no evidence of any such desire, and, as a matter of fact, no humiliation was effected. The primary and fundamental

element in this and similar cases is an almost abstract sexual fascination in the idea of restraint, whether endured, inflicted, or merely witnessed or imagined; the feet become the chief focus of this fascination, and the basis on which a foot-fetichism or shoe-fetichism tends to arise, because restraint of the feet produces a more marked effect than restraint of the hands.

FOOTNOTES:

[120] An attenuated and symbolic form of this impulse is seen in the desire to strangle birds with the object of stimulating or even satisfying sexual desire. Prostitutes are sometimes acquainted with men who bring a live pigeon with them to be strangled just before intercourse. Lanphear, of St. Louis (*_Alienist and Neurologist_*, May, 1907, p. 204) knew a woman, having learned masturbation in a convent school, who was only excited and not satisfied by coitus with her husband, and had to rise from bed, catch and caress a chicken, and finally wring its neck, whereupon orgasm occurred.

[121] Even young girls, however, may experience pleasure in the playful attempt to strangle. Thus a lady speaking of herself at the time of puberty, when she was in the habit of masturbating, writes (*_Sexual-Probleme_*, Aug., 1909, p. 636): "I acquired a desire to seize people, especially girls, by the throat, and I enjoyed their way of screaming out."

[122] Godard observed that when animals are bled, or felled, as well as strangled, there is often abundant emission, rich in spermatozoa, but without erection, though accompanied by the same movements of the tail as during copulation. Robin (art. "Fécondation," *_Dictionnaire Encyclopédique des Sciences Médicales_*), who quotes this observation, has the following remarks on this subject: "Ejaculation occurring at the moment when the circulation, maintained artificially, stops is a fact of significance. It shows how congestive conditions--or inversely anemic conditions--constitute organic states sufficient to set in movement the activity of the nerve-centers, as is the case for muscular contractility.... Everything leads us to believe that at the moment when the motor nervous action takes place the corresponding sensitive centers also come into play." It must be added that Minovici, in his elaborate study of death by hanging ("Etude sur la Pendaison," *_Archives d'Anthropologie Criminelle_*, 1905, especially p. 791 et seq.), concludes

that the turgescence of penis and flow of spermatic fluid (sometimes only prostatic secretion) usually observed in these cases is purely passive and generally, though not always, of post-mortem occurrence. There is, therefore, no sexual pleasure in death by hanging, and persons who have been rescued at the last moment have experienced no voluptuous sensations. This was so even in the case, referred to by Minovici, of a man who hanged himself solely with the object of producing sexual pleasure.

[123] Eulenburg, *_Sexuale Neuropathie_*, p. 114.

[124] Bernaldo de Quirós and Llanos Aguilaniedo (*_La Mala Vida en Madrid_*, p. 294) knew the case of a man who found pleasure in lying back on an inclined couch while a prostitute behind him pulled at a slipknot until he was nearly suffocated; it was the only way in which he could attain sexual gratification.

[125] Arrest of respiration, it may be noted, may accompany strong sexual excitement, as it may some other emotional states; one recalls passages in the *_Arabian Nights_* in which we are told of ladies who at the sight of a very beautiful youth "felt their reason leave them, yearned to embrace the marvelous youth, and *_ceased breathing_*." Inhibited respiration is indeed, as Stevens shows ("Study of Attention," *_American Journal of Psychology_*, Oct., 1905), a characteristic of all active attention.

[126] The exact part played by the respiration and even the circulation in constituting emotional states is still not clear, although various experiments have been made; see, e.g., Angell and Thompson, "A Study of the Relations between Certain Organic Processes and Consciousness," *_Psychological Review_*, January, 1899. A summary statement of the relations of the respiration and circulation to emotional states will be found in Külpe's *_Outlines of Psychology_*, part i, section 2, § 37.

[127] The words alluded to by my correspondent are as follows: "I needed a struggle; what I needed was that feeling should guide life, and not that life should guide feeling. I wanted to go with him to the edge of an abyss and say: 'Here a step and I will throw myself over; and here a motion and I have gone to destruction'; and for him, turning pale, to seize me in his strong arms, hold me back over it till my heart grew cold within me, and then carry me away wherever he pleased." The whole of the passage in which these lines occur is of considerable psychological interest. In one English translation the story is entitled *_Family Happiness_*.

V.

Pain, and Not Cruelty, the Essential Element in Sadism and Masochism--Pain Felt as Pleasure--Does the Sadist Identify Himself with the Feelings of his Victim?--The Sadist often a Masochist in Disguise--The Spectacle of Pain or Struggle as a Sexual Stimulant.

In the foregoing rapid survey of the great group of manifestations in which the sexual emotions come into intimate relationship with pain, it has become fairly clear that the ordinary division between "sadism" and "masochism," convenient as these terms may be, has a very slight correspondence with facts. Sadism and masochism may be regarded as complementary emotional states; they cannot be regarded as opposed states.[128] Even De Sade himself, we have seen, can scarcely be regarded as a pure sadist. A passage in one of his works expressing regret that sadistic feeling is rare among women, as well as his definite recognition of the fact that the suffering of pain may call forth voluptuous emotions, shows that he was not insensitive to the charm of masochistic experience, and it is evident that a merely blood-thirsty vampire, sane or insane, could never have retained, as De Sade retained, the undying devotion of two women so superior in heart and intelligence as his wife and sister-in-law. Had De Sade possessed any wanton love of cruelty, it would have appeared during the days of the Revolution, when it was safer for a man to simulate blood-thirstiness, even if he did not feel it, than to show humanity. But De Sade distinguished himself at that time not merely by his general philanthropic activities, but by saving from the scaffold, at great risk to himself, those who had injured him. It is clear that, apart from the organically morbid twist by which he obtained sexual satisfaction in his partner's pain,--a craving which was, for the most part, only gratified in imaginary visions developed to an inhuman extent under the influence of solitude,--De Sade was simply, to those who knew him, "*un aimable mauvais sujet*" gifted with exceptional intellectual powers. Unless we realize this we run the risk of confounding De Sade and his like with men of whom Judge Jeffreys was the sinister type.

It is necessary to emphasize this point because there can be no doubt that De Sade is really a typical instance of the group of perversions he represents, and when we understand that it is pain only, and not cruelty,

that is the essential in this group of manifestations we begin to come nearer to their explanation. The masochist desires to experience pain, but he generally desires that it should be inflicted in love; the sadist desires to inflict pain, but in some cases, if not in most, he desires that it should be felt as love. How far De Sade consciously desired that the pain he sought to inflict should be felt as pleasure it may not now be possible to discover, except by indirect inference, but the confessions of sadists show that such a desire is quite commonly essential.

I am indebted to a lady for the following communication on the foregoing aspect of this question: "I believe that, when a person takes pleasure in inflicting pain, he or she imagines himself or herself in the victim's place. This would account for the transmutability of the two sets of feelings. This might be particularly so in the case of men. A man may not care to lower his dignity and vanity by putting himself in subjection to a woman, and he might fear she would feel contempt for him. By subduing her and subjecting her to passive restraint he would preserve, even enhance, his own power and dignity, while at the same time obtaining a reflected pleasure from what he imagined she was feeling.

"I think that when I get pleasure out of the idea of subduing another it is this reflected pleasure I get. And if this is so one could thus feel more kindly to persons guilty of cruelty, which has hitherto always seemed the one unpardonable sin. Even criminals, if it is true that they are themselves often very insensitive, may, in the excitement of the moment, imagine that they are only inflicting trifling pain, as it would be to them, and that their victim's feelings are really pleasurable. The men I have known most given to inflicting pain are all particularly tender-hearted when their passions are not in question. I cannot understand how (as in a case mentioned by Krafft-Ebing) a man could find any pleasure in binding a girl's hands except by imagining what he supposed were her feelings, though he would probably be unconscious that he put himself in her place.

"As a child I exercised a good deal of authority and influence over my youngest sister. It used to give me considerable pleasure to be somewhat arbitrary and severe with her, but, though I never admitted it to myself or to her, I knew instinctively that she took pleasure in my treatment. I used to give her childish

lessons, over which I was very strict. I invented catechisms and chapters of the Bible in which elder sisters were exhorted to keep their juniors under discipline, and younger sisters were commanded to give implicit submission and obedience. Some parts of the Imitation lent themselves to this sort of parody, which never struck me as in any way irreverent. I used to give her arbitrary orders to 'exercise her in obedience,' as I told her, and I used to punish her if she disobeyed me. In all this I was, though only half consciously, guided through my own feelings as to what I should have liked in her place. For instance, I would make her put down her playthings and come and repeat a lesson; but, though she was in appearance having her will subdued to mine, I always chose a moment when I foresaw she would soon be tired of play. There was sufficient resistance to make restraint pleasurable, not enough to render it irksome. In my punishments I acted on a similar principle. I used to tie her hands behind her (like the man in Krafft-Ebing's case), but only for a few moments; I once shut her in a sort of cupboard-room, also for a very short time. On two or three occasions I completely undressed her, made her lie down on the bed, tied her hands and feet to the bedstead, and gave her a slight whipping. I did not wish to hurt her, only to inflict just enough pain to produce the desire to move or resist. My pleasure, a very keen one, came from the imagined excitement produced by the thwarting of this desire. (Are not your own words--that 'emotion' is 'motion in a more or less arrested form'--an epigrammatic summary of all this, though in a somewhat different connection?) I did not undress her from any connection of nakedness with sexual feeling, but simply to enhance her feeling of helplessness and defenselessness under my hands. If I were a man and the woman I loved were refractory I should undress her before finding fault with her. A woman's dress symbolizes to her the protection civilization affords to the weak and gives her a fictitious strength. Naked, she is face to face with primitive conditions, her weakness opposed to the man's power. Besides, the sense of shame at being naked under the eyes of a man who regarded her with displeasure would extend itself to her offense and give him a distinct, though perhaps unfair, advantage. I used the bristle side of a brush to chastise her with, as suggesting the greatest amount of severity with the least possible pain. In fact, my idea was to produce the maximum of emotion with the minimum of actual discomfort.

"You must not, however, suppose that at the time I reasoned about it at all in this way. I was very fond of her, and honestly believed I was doing it for her good. Had I realized then, as I do now, that my sole aim and object was physical pleasure, I believe my pleasure would have ceased; in any case I should not have felt justified in so treating her. Do I at all persuade you that my pleasure was a reflection of hers? That it was, I think, is clear from the fact that I only obtained it when she was willing to submit. Any real resistance or signs that I was overpassing the boundary of pleasure in her and urging on pain without excitement caused me to desist and my own pleasure to cease.

"I disclaim all altruism in my dealings with my sister. What occurs appears to me to be this: A situation appeals to one in imagination and one at once desires to transfer it to the realms of fact, being one's self one of the principal actors. If it is the passive side which appeals to one, one would prefer to be passive; but if that is not obtainable then one takes the active part as next best. In either case, however, it is the realization of the imagined situation that gives the pleasure, not the other person's pleasure as such, although his or her supposed pleasure creates the situation. If I were a man it would afford me great delight to hold a woman over a precipice, even if she disliked it. The idea appeals to me so strongly that I could not help imagining her pleasure, though I might know she got none, and even though she made every demonstration of fear and dislike of it. The situation so often imagined would have become a fact. It seems to me I have to say a thing is and is not in the same breath, but the confusion is only in the words.

"Let me give you another example: I have a tame pigeon which has a great affection for me. It sits on my shoulder and squats down with its wings out as birds do when courting, pecking me to make me take notice of it, and flickering its wings. I like to hold it so that it can't move its wings, because I imagine this increases its excitement. If it struggles, or seems to dislike my holding it, I let it go.

"In an early engagement (afterward broken off) my fiancé used to take an evident pleasure in telling me how he would punish me if I disobeyed him when we were married. Though we had but little

in common mentally, I was frequently struck with the similarity between his ideas and what my own had been in regard to my sister. He used his authority over me most capriciously. On one occasion he would not let me have any supper at a dance. On another he objected to my drinking black coffee. No day passed without a command or prohibition on some trifling point. Whenever he saw, though, that I really disliked the interference or made any decided resistance, which happened very seldom, he let me have my own way at once. I cannot but think, when I recall the various circumstances, that he got a certain pleasure, as I had done with my sister, by an almost unconscious transference of my feelings to himself.

"I find, too, that, when I want a man to say or do to me what would cause me pleasure and he does not gratify me, I feel an intense longing to change places, to be the man and make him, as the woman, feel what I want to feel. Combined with this is a sense of irritation at not being gratified and a desire to punish him for my deprivation, for his stupidity in not saying or doing the right thing. I don't feel any anger at a man not caring for me, but only for not divining my feelings when he does care.

"Now let me take another case: that of the man who used to experience pleasure when surprising a woman making water. (Cf. _Archives d'Anthropologie Criminelle_, Nov. 15, 1900.) Here the woman's embarrassment appears to be a factor; but it seems to me there must be more than this, as confusion might be produced in so many other ways, as if she were found bathing, or undressed, though it might not be so acute. In reality, I fancy she would be checked in what she was doing, and that the man, perhaps unconsciously, imagined this check and a resulting excitement. That such a check does sometimes produce excitement I know from experience in traveling. If the bladder is not emptied before connection the pleasure is often more intense. Long before I understood these things at all I was struck by this quotation: 'Cette volupté que ressentent les bords de la mer, d'être toujours pleins sans jamais déborder?' What would be the effect on a man of a sudden check at the supreme moment of sexual pleasure? In reality, I suppose, pain, as the nerves would be at their full tension and unable to respond to any further stimulus; but, in imagination, one's nerves are not at their highest tension, and one imagines an increase or, at any rate, a

prolongation of the pleasurable sensations. Something of all this, some vague _reflection_ of the woman's possible sensations, seems to enter in the man's feelings in surprising the woman. In any case his pleasure in her confusion seems to me a reflection of her feelings, for the sense of shame and embarrassment before a man is very exciting, and doubly so if one realizes that the man enjoys it. Ouida speaks of the 'delicious shame' experienced by 'Folle Farine.'

"It seems to me that whenever we are affected by another's emotion we do practically, though unconsciously, put ourselves in his place; but we are not always able to gauge accurately its intensity or to allow for differences between ourselves and another, and, in the case of pain, it is doubly difficult, as we can never recall the pain itself, but only the mental effects upon us of the pain. We cannot even recall the feeling of heat when we are cold, or _vice versa_, with any degree of vividness.

"A woman tells me of a man who frequently asks her if she would not like him to whip her. He is greatly disappointed when she says she gets no pleasure from it, as it would give him so much to do it. He cannot believe she experiences none, because he would enjoy being whipped so keenly if he were a girl. In another case the man thinks the woman _must_ enjoy suffering, _because_ he would get intense pleasure from inflicting it! Why is this, unless he would like it if a woman, and confuses in his mind the two personalities? All the men I know who are sadistically inclined admit that if they were women they would like to be harshly treated.

"Of course, I quite see there may be many complications; a man's natural anger at resistance may come in, and also simple, not sexual, pleasure in acts of crushing, etc. I always feel inclined to crush anything very soft or a person with very pretty thick hair, to rub together two shining surfaces, two bits of satin, etc., apart from any feelings of excitement. My explanation only refers to that part of sadism which is sexual enjoyment of another's pain."

That the foregoing view holds good as regards the traces of sadism found within the normal limits of sexual emotion has already been stated. We may also believe that it is true in many

genuinely perverse cases. In this connection reference may be made to an interesting case, reported by Moll, of a married lady 23 years of age, with pronounced sadistic feelings. She belongs to a normal family and is herself apparently quite healthy, a tall and strongly built person, of feminine aspect, fond of music and dancing, of more than average intelligence. Her perverse inclinations commenced obscurely about the age of 14, when she began to be dominated by the thought of the pleasure it would be to strike and torture a man, but were not clearly defined until the age of 18, while at an early age she was fond of teasing and contradicting men, though she never experienced the same impulse toward women. She has never, except in a very slight degree, actually carried her ideas into practice, either with her husband or anyone else, being restrained, she says, by a feeling of shame. Coitus, though frequently practised, gives her no pleasure, seems, indeed, somewhat disgusting to her, and has never produced orgasm. Her own ideas, also, though very pleasurable to her, have not produced definite sexual excitement, except on two or three occasions, when they had been combined with the influence of alcohol. She frankly regrets that modern social relationship makes it impossible for her to find sexual satisfaction in the only way in which such satisfaction would be possible to her.

Her chief delight would be to torture the man she was attached to in every possible way; to inflict physical pain and mental pain would give her equal pleasure. "I would bite him till the blood came, as I have often done to my husband. At that moment all sympathy for him would disappear." She frequently identifies her imaginary lover with a real man to whom she feels that she could be much more attracted than she is to her husband. She imagines to herself that she makes appointments with this lover, and that she reaches the rendezvous in her carriage, but only after her lover has been waiting for her a very long time in the cold. Then he must feel all her power, he must be her slave with no will of his own, and she would torture him with various implements as seemed good to her. She would use a rod, a riding-whip, bind him and chain him, and so on. But it is to be noted that she declares "_this could, in general, only give me enjoyment if the man concerned endured such torture with a certain pleasure_. He must, indeed, writhe with pain, but at the same time be in a state of sexual ecstasy, followed by satisfaction." His pleasure must not,

however, be so great that it overwhelms his pain; if it did, her own pleasure would vanish, and she has found witty her husband that when in kissing him her bites have given him much pleasure she has at once refrained.

It is further noteworthy that only the pain she herself had inflicted would give her pleasure. If the lover suffered pain from an accident or a wound she is convinced that she would be full of sympathy for him. Outside her special sexual perversion she is sympathetic and very generous. (Moll, *„Konträre Sexualempfindung“*, 1899, pp. 507-510.)

This case is interesting as an uncomplicated example of almost purely ideal sadism. It is interesting to note the feelings of the sadist subject toward her imaginary lover's feelings. It is probably significant that, while his pleasure is regarded as essential, his pain is regarded as even more essential, and the resulting apparent confusion may well be of the very essence of the whole phenomenon. The pleasure of the imaginary lover must be secured or the manifestation passes out of the sexual sphere; but his pleasure must, at all costs, be conciliated with his pain, for in the sadist's eyes the victim's pain has become a vicarious form of sexual emotion. That, at the same time, the sadist desires to give pleasure rather than pain finds confirmation in the fact that he often insists on pleasure being feigned even though it is not felt. Some years ago a rich Jewish merchant became notorious for torturing girls with whom he had intercourse; his performances acquired for him the title of *„l'homme qui pique“*, and led to his prosecution. It was his custom to spend some hours in sticking pins into various parts of the girl's body, but it was essential that she should wear a smiling face throughout the proceedings. (Hamon, *„La France Sociale et Politique“*, 1891, p. 445 et seq.)

We have thus to recognize that sadism by no means involves any love of inflicting pain outside the sphere of sexual emotion, and is even compatible with a high degree of general tender-heartedness. We have also to recognize that even within the sexual sphere the sadist by no means wishes to exclude the victim's pleasure, and may even regard that pleasure as essential to his own satisfaction. We have, further, to recognize that, in view of the close connection between sadism and masochism, it is highly probable that in some cases the sadist is really a disguised masochist and

enjoys his victim's pain because he identifies himself with that pain.

But there is a further group of cases, and a very important group, on account of the light it throws on the essential nature of these phenomena, and that is the group in which the thought or the spectacle of pain acts as a sexual stimulant, without the subject identifying himself clearly either with the inflicter or the sufferer of the pain. Such cases are sometimes classed as sadistic; but this is incorrect, for they might just as truly be called masochistic. The term *algolagnia* might properly be applied to them (and Eulenburg now classes them as "ideal *algolagnia*"), for they reveal an undifferentiated connection between sexual excitement and pain not developed into either active or passive participation. Such feelings may arise sporadically in persons in whom no sadistic or masochistic perversion can be said to exist, though they usually appear in individuals of neurotic temperament. Casanova describes an instance of this association which came immediately under his own eyes at the torture and execution of Damiens in 1757.[129] W.G. Stearns knew a man (having masturbated and had intercourse to excess) who desired to see his wife delivered of a child, and finally became impotent without this idea. He witnessed many deliveries and especially obtained voluptuous gratification at the delivery of a primipara when the suffering was greatest.[130] A very trifling episode may, however, suffice. In one case known to me a man, neither sadistic nor masochistic in his tendencies, when sitting looking out of his window saw a spider come out of its hole to capture and infold a fly which had just been caught in its web; as he watched the process he became conscious of a powerful erection, an occurrence which had never taken place under such circumstances before.[131] Under favoring conditions some incident of this kind at an early age may exert a decisive influence on the sexual life. Tambroni, of Ferrara, records the case of a boy of 11 who first felt voluptuous emotions on seeing in an illustrated journal the picture of a man trampling on his daughter; ever afterward he was obliged to evoke this image in masturbation or coitus.[132] An instructive case has been recorded by Féré. In this case a lady of neurotic heredity on one side, and herself liable to hysteria, experienced her first sexual crisis at the age of 13, not long after menstruation had become established, and when she had just recovered from an attack of chorea. Her old nurse, who had remained in the service of the family, had a ne'er-do-well son who had disappeared for some years and had just now suddenly returned and thrown himself, crying and sobbing, at the knees of his mother, who thrust him away. The young girl accidentally witnessed this scene. The cries and the sobs provoked in her a sexual excitement she had never experienced before. She rushed away in surprise to the next

room, where, however, she could still hear the sobs, and soon she was overcome by a sexual orgasm. She was much troubled at this occurrence, and at the attraction which she now experienced for a man she had never seen before and whom she had always looked upon as a worthless vagabond. Shortly afterward she had an erotic dream concerning a man who sobbed at her knees. Later she again saw the nurse's son, but was agreeably surprised to find that, though a good-looking youth, he no longer caused her any emotion, and he disappeared from her mind, though the erotic dreams concerning an unknown sobbing man still occurred rather frequently. During the next ten years she suffered from various disorders of more or less hysterical character, and, although not disinclined to the idea of marriage, she refused all offers, for no man attracted her. At the age of 23, when staying in the Pyrenees, she made an excursion into Spain, and was present at a bull-fight. She was greatly excited by the charges of the bull, especially when the charge was suddenly arrested.[133] She felt no interest in any of the men who took part in the performance or were present; no man was occupying her imagination. But she experienced sexual sensations and accompanying general exhilaration, which were highly agreeable. After one bull had charged successively several times the orgasm took place. She considered the whole performance barbarous, but could not resist the desire to be present at subsequent bull-fights, a desire several times gratified, always with the same results, which were often afterward repeated in dreams. From that time she began to take an interest in horse-races, which she now found produced the same effect, though not to the same degree, especially when there was a fall. She subsequently married, but never experienced sexual satisfaction except under these abnormal circumstances or in dreams.[134]

As the foregoing case indicates, horses, and especially running or struggling horses, sometimes have the same effect in stimulating the sexual emotions, especially on persons predisposed by neurotic heredity, as we have found that the spectacle of pain possesses. A medical correspondent in New Zealand tells me of a patient of his own, a young carpenter of 26, not in good health, who had never masturbated or had connection with a woman. He lived in a room overlooking a livery-stable yard where was kept, among other animals, a large black horse. Nearly every night he had a dream in which he seemed to be pursuing this large black horse, and when he caught it, which he invariably did, there was a copious emission. A holiday in the country and tonic treatment dispelled the dreams and reduced the nocturnal emissions to normal frequency. Féré has recorded a case of a boy, of neuropathic heredity, who, when 14 years of age, was one day about to practise mutual masturbation with another boy

of his own age. They were seated on a hillside overlooking a steep road, and at this moment a heavy wagon came up the road drawn by four horses, which struggled painfully up, encouraged by the cries and the whip of the driver. This sight increased the boy's sexual excitement, which reached its climax when one of the horses suddenly fell. He had never before experienced such intense excitement, and always afterward a similar spectacle of struggling horses produced a similar effect.[135]

In this connection reference may be made to the frequency with which dreams of struggling horses occur in connection with disturbance or disease of the heart. In such cases it is clear that the struggling horses seem to dream-consciousness to embody and explain the panting struggles to which the heart is subjected. They become, as it were, a visual symbol of the cardiac oppression. In much the same way, it would appear, under the influence of sexual excitement, in which cardiac disturbance is one of the chief constituent elements, the struggling horses became a sexual symbol, and, having attained that position, they are henceforth alone adequate to produce sexual excitement.

FOOTNOTES:

[128] This opinion appears to be in harmony with the conclusions of Eulenburg, who has devoted special study to De Sade, and points out that the ordinary conception of "sadism" is much too narrow. (Eulenburg, *_Sexuale Neuropathie_*, 1895, p. 110 et seq.)

[129] Casanova, *_Mémoires_*, vol. viii, pp. 74-76. Goncourt in his *_Journal_*, under date of April, 1862 (vol. ii, p. 27), tells a story of an Englishman who engaged a room overlooking a scaffold where a murderer was to be hanged, proposing to take a woman with him and to avail himself of the excitement aroused by the scene. This scheme was frustrated by the remission of the death penalty.

[130] *_Alienist and Neurologist_*, May, 1907, p. 204.

[131] This spectacle of the spider and the fly seems indeed to be specially apt to exert a sexual influence. I have heard of a precisely similar case in a man of intellectual distinction, and another in a lady who acknowledged to a feeling of "exquisite pleasure," on one occasion, at the mere sound of the death agony of a fly in a spider's web.

[132] Quoted by Obici and Marchesini, *_Le Amicizie di Collegio_*, p. 245.

[133] It may be noted that we have already several times encountered this increase of excitement produced by arrest of movement. The effect is produced whether the arrest is witnessed or is actually experienced. "A man can increase a woman's excitement," a lady writes, "by forbidding her to respond in any way to his caresses. It is impossible to remain quite passive for more than a few seconds, but, during these few, excitement is considerably augmented." In a similar way I have been told of a man of brilliant intellectual ability who very seldom has connection with a woman without getting her to compress with her hand the base of the urethral canal to such an extent as to impede the passage of the semen. On withdrawal of the hand copious emission occurs, but it is the shock of the arrest caused by the constriction which gives him supreme pleasure. He has practised this method for years without evil results.

VI.

Why is Pain a Sexual Stimulant?--It is the Most Effective Method of Arousing Emotion--Anger and Fear the Most Powerful Emotions--Their Biological Significance in Courtship--Their General and Special Effects in Stimulating the Organism--Grief as a Sexual Stimulant--The Physiological Mechanism of Fatigue Renders Pain Pleasurable.

We have seen that the distinction between "sadism" and "masochism" cannot be maintained; not only was even De Sade himself something of a masochist and Sacher-Masoch something of a sadist, but between these two extreme groups of phenomena there is a central group in which the algolagnia is neither active nor passive. "Sadism" and "masochism" are simply convenient clinical terms for classes of manifestations which quite commonly occur in the same person. We have further found that--as might have been anticipated in view of the foregoing result--it is scarcely correct to use the word "cruelty" in connection with the phenomena we have been

considering. The persons who experience these impulses usually show no love of cruelty outside the sphere of sexual emotion; they may even be very intolerant of cruelty. Even when their sexual impulses come into play they may still desire to secure the pleasure of the persons who arouse their sexual emotions, even though it may not be often true that those who desire to inflict pain at these moments identify themselves with the feelings of those on whom they inflict it. We have thus seen that when we take a comprehensive survey of all these phenomena a somewhat general formula will alone cover them. Our conclusion so far must be that under certain abnormal circumstances pain, more especially the mental representation of pain, acts as a powerful sexual stimulant.

The reader, however, who has followed the discussion to this point will be prepared to take the next and final step in our discussion and to reach a more definite conclusion. The question naturally arises: By what process does pain or its mental representation thus act as a sexual stimulant? The answer has over and over again been suggested by the facts brought forward in this study. Pain acts as a sexual stimulant because it is the most powerful of all methods for arousing emotion.

The two emotions most intimately associated with pain are anger and fear. The more masculine and sthenic emotion of anger, the more passive and asthenic emotion of fear, are the fundamental animal emotions through which, on the psychic side, the process of natural selection largely works. Every animal in some degree owes its survival to the emotional reaction of anger against weaker rivals, to the emotional reaction of fear against stronger rivals. To this cause we owe it that these two emotions are so powerfully and deeply rooted in the whole zoölogical series to which we belong. But anger and fear are not less fundamental in the sexual life. Courtship on the male's part is largely a display of combativity, and even the very gestures by which the male seeks to appeal to the female are often those gestures of angry hostility by which he seeks to intimidate enemies. On the female's part courtship is a skillful manipulation of her own fears, and, as we have seen elsewhere, when studying the phenomena of modesty, that fundamental attitude of the female in courtship is nothing but an agglomeration of fears.

The biological significance of the emotions is now well recognized. "In general," remarks one of the shrewdest writers on animal psychology, "we may say that emotional states are, under natural conditions, closely associated with behavior of biological value--with tendencies that are beneficial in

self-preservation and race preservation--with actions that promote survival, and especially with the behavior which clusters round the pairing and parental instincts. The value of the emotions in animals is that they are an indirect means of furthering survival." (Lloyd Morgan, *_Animal Behavior_*, p. 293.) Emotional aptitudes persist not only by virtue of the fact that they are still beneficial, but because they once were; that is to say, they may exist as survivals. In this connection I may quote from a suggestive paper on "Teasing and Bullying," by F.L. Burk; at the conclusion of this study, which is founded on a large body of data concerning American children, the author asks: "Accepting for the moment the theories of Spencer and Ribot upon the transmission of rudimentary instincts, is it possible that the movements which comprise the chief elements of bullying, teasing, and the egotistic impulses in general of the classes cited--pursuing, throwing down, punching, striking, throwing missiles, etc.--are, from the standpoint of consciousness, broken neurological fragments, which are parts of old chains of activity involved in the pursuit, combat, capture, torture, and killing of men and enemies?... Is not this hypothesis of transmitted fragments of instincts in accord with the strangely anomalous fact that children are at one moment seemingly cruel and at the next affectionate and kind, vibrating, as it were, between two worlds, egotistic and altruistic, without conscious sense of incongruity?" (F.L. Burk, "Teasing and Bullying," *_Pedagogical Seminary_*, April, 1897.)

The primitive connection of the special emotions of anger and fear with the sexual impulse has been well expressed by Colin Scott in his remarkable study of "Sex and Art": "If the higher forms of courting are based on combat, among the males at least anger must be intimately associated with love. And below both of these lies the possibility of fear. In combat the animal is defeated who is first afraid. Competitive exhibition of prowess will inspire the less able birds with a deterring fear. Young grouse and woodcock do not enter the lists with the older birds, and sing very quietly. It is the same with the very oldest birds. Audubon says that the old maids and bachelors of the Canada goose move off by themselves during the courting of the younger birds. In order to succeed in love, fear must be overcome in the male as well as in the female. Courage is the essential male virtue, love is its outcome and reward. The strutting, crowing, dancing, and

singing of male birds and the preliminary movements generally of animals must gorge the neuromotor and muscular systems with blood and put them in better fighting trim. The effects of this upon the feelings of the animal himself must be very great. Hereditary tendencies swell his heart. He has 'the joy that warriors feel.' He becomes regardless of danger, and sometimes almost oblivious of his surroundings. This intense passionateness must react powerfully on the whole system, and more particularly on those parts which are capable, such as the brain, of using up a great surplus of blood, and on the naturally erethic functions of sex. The flood of anger or fighting instinct is drained off by the sexual desires, the antipathy of the female is overcome, and sexual union successfully ensues.... Courting and combat shade into one another, courting tending to take the place of the more basal form of combat. The passions which thus come to be associated with love are those of fear and anger, both of which, by arousing the whole nature and stimulating the nutritive sources from which they flow, come to increase the force of the sexual passion to which they lead up and in which they culminate and are absorbed," (Colin Scott, "Sex and Art," *American Journal of Psychology*, vol. vii, No. 2, pp. 170 and 215.)

It must be remembered that fear is an element liable to arise in all courtship on one side or the other. It is usually on the side of the female, but not invariably. Among spiders, for instance, it is usually the male who feels fear, and very reasonably, for he is much weaker than the female. "Courtship by the male spider" says T.H. Montgomery ("The Courtship of Araneads," *American Naturalist*, March, 1910, p. 166), "results from a combination of the state of desire for and fear of the female." It is by his movements of fear that he advertises himself to the female as a male, and it is by the same movements that he is unconsciously impelled to display prominently his own ornamentation.

We are thus brought to those essential facts of primitive courtship with which we started. But we are now able to understand more clearly how it is that alien emotional states became abnormally associated with the sexual life. Normally the sexual impulse is sufficiently reinforced by the ordinary active energies of the organism which courtship itself arouses, energies which, while they may be ultimately in part founded on anger and fear, rarely allow these emotions to be otherwise than latent. Motion, it may be said, is more prominent than emotion.

Even normally a stimulant to emotional activities is pleasurable, just as motion itself is pleasurable. It may even be useful, as was noted long ago by Erasmus Darwin; he tells of a friend of his who, when painfully fatigued by riding, would call up ideas arousing indignation, and thus relieve the fatigue, the indignation, as Darwin pointed out, increasing muscular activity.[136]

It is owing to this stimulating action that discomfort, even pain, may be welcomed on account of the emotional waves they call up, because they "lash into movement the dreary calm of the sea's soul," and produce that alternation of pain and enjoyment for which Faust longed. Groos, who recalls this passage in his very thorough and profound discussion of the region wherein tragedy has its psychological roots, points out that it is the overwhelming might of the storm itself, and not the peace of calm after the storm, which appeals to us. In the same way, he observes, even surprise and shock may also be pleasurable, and fear, though the most depressing of emotional states, by virtue of the joy produced by strong stimuli is felt as attractive; we not only experience an impulse of pleasure in dominating our environment, but also have pleasure in being dominated and rendered helpless by a higher power.[137] Hirn, again, in his work on the origins of art, has an interesting chapter on "The Enjoyment of Pain," a phenomenon which he explains by its resultant reactions in increase of outward activity, of motor excitement. Anger, he observes elsewhere, is "in its active stage a decidedly pleasurable emotion. Fear, which in its initial stage is paralyzing and depressing, often changes in time when the first shock has been relieved by motor reaction.... Anger, fear, sorrow, notwithstanding their distinctly painful initial stage, are often not only not avoided, but even deliberately sought." [138]

In the ordinary healthy organism, however, although the stimulants of strong emotion may be vaguely pleasurable, they do not have more than a general action on the sexual sphere, nor are they required for the due action of the sexual mechanism. But in a slightly abnormal organism--whether the anomaly is due to a congenital neuropathic condition, or to a possibly acquired neurasthenic condition, or merely to the physiological inadequacy of childhood or old age--the balance of nervous energy is less favorable for the adequate play of the ordinary energies in courtship. The sexual impulse is itself usually weaker, even when, as often happens, its irritability assumes the fallacious appearance of strength. It has become unusually sensitive to unusual stimuli and

also, it is possible,--perhaps as a result of those conditions,--more liable to atavistic manifestations. An organism in this state becomes peculiarly apt to seize on the automatic sources of energy generated by emotion. The parched sexual instinct greedily drinks up and absorbs the force it obtains by applying abnormal stimuli to its emotional apparatus. It becomes largely, if not solely, dependent on the energy thus secured. The abnormal organism in this respect may become as dependent on anger or fear, and for the same reason, as in other respects it may become dependent on alcohol.

We see the process very well illustrated by the occasional action of the emotion of anger. In animals the connection between love and anger is so close that even normally, as Groos points out, in some birds the sight of an enemy may call out the gestures of courtship.[139] As Krafft-Ebing remarks, both love and anger "seek their object, try to possess themselves of it, and naturally exhaust themselves in a physical effect on it; both throw the psychomotor sphere into the most intense excitement, and by means of this excitement reach their normal expression." [140] Féré has well remarked that the impatience of desire may itself be regarded as a true state of anger, and Stanley Hall, in his admirable study of anger, notes that "erethism of the breasts or sexual parts" was among the physical manifestations of anger occurring in some of his cases, and in one case a seminal emission accompanied every violent outburst.[141] Thus it is that anger may be used to reinforce a weak sexual impulse, and cases have been recorded in which coitus could only be performed when the man had succeeded in working himself up into an artificial state of anger.[142] On the other hand, Féré has recorded a case in which the sexual excitement accompanying delayed orgasm was always transformed into anger, though without any true sadistic manifestations.[143]

As a not unexpected complementary phenomenon to this connection of anger and sexual emotion in the male, it is sometimes found that the spectacle of masculine anger excites pleasurable emotion in women. The case has been recorded of a woman who delighted in arousing anger for the pleasure it gave her, and who advised another woman to follow her example and excite her husband's anger, as nothing was so enjoyable as to see a man in a fury of rage[144]; Lombroso mentions a woman who was mostly frigid, but experienced sexual feelings when she heard anyone swearing; and a medical friend tells me of a lady considerably past middle age who experienced sexual erethism after listening to a heated argument between her husband and a friend on religious topics. The case has also been recorded of a masochistic man who found sexual satisfaction in masturbating while a

woman, by his instructions, addressed him in the lowest possible terms of abuse.[145] Such a feeling doubtless underlies that delight in teasing men which is so common among young women. Stanley Hall, referring to the almost morbid dread of witnessing manifestations of anger felt by many women, remarks: "In animals, females are often described as watching with complacency the conflict of rival males for their possession, and it seems probable that the intense horror of this state, which many females report, is associated more or less unconsciously with the sexual rage which has followed it." [146] The dread may well be felt at least as much as regards the emotional state in themselves as in the males.

Even when the emotion aroused is disgust it may still act as a sexual stimulant. Stcherbak has narrated the instructive case of a very intelligent and elegant married lady of rather delicate constitution, an artist of some talent, who never experienced any pleasure in sexual intercourse, but ever since sexual feelings first began to be manifested at all (at the age of 18) has only experienced them in relation to disgusting things. Anything that is repulsive, like vomit, etc., causes vague but pleasurable feelings which she gradually came to recognize as sexual. The sight of a crushed frog will cause very definite sexual sensations. She has had many admirers and she has observed that a declaration of love by a disagreeable or even repulsive man sexually excites her, though she has no desire for sexual intercourse with him.[147]

After all that has gone before it is easy to see how the emotion of fear may act in an analogous manner to anger. Just as anger may reinforce the active forms of the sexual impulse to which it is allied, so fear may reinforce the passive forms of that impulse. The following observations, written by a lady, very well show how we may thus explain the sexual attractiveness of whipping: "The fascination of whipping, which has always greatly puzzled me, seems to be a sort of hankering after the stimulus of fear. In a wild state animals live in constant fear. In civilized life one but rarely feels it. A woman's pleasure in being afraid of a husband or lover may be an equivalent of a man's love of adventure; and the fear of children for their parents may be the dawning of the love of adventure. In a woman this desire of adventure receives a serious check when she begins to realize what she might be subjected to by a man if she gratified it. Excessive fear is demoralizing, but it seems to me that the idea of being whipped gives a sense of fear which is not excessive. It is almost the only kind of pain (physical) which is inflicted on children or women by persons whom they can love and trust, and with a moral object. Any other

kind of bodily ill treatment suggests malignity and may rouse resentment, and, in extreme cases, an excess of fear which goes beyond the limits of pleasurable excitement. Given a hereditary feeling of this sort, I think it is helped by the want of actual experience, as the association with excitement is freed from the idea of pain as such." In his very valuable and suggestive study of fears, Stanley Hall, while recognizing the evil of excessive fear, has emphasized the emotional and even the intellectual benefits of fear, and the great part played by fear in the evolution of the race as "the rudimentary organ on the full development and subsequent reduction of which many of the best things in the soul are dependent." "Fears that paralyze some brains," he remarks, "are a good tonic for others. In some form and degree all need it always. Without the fear apparatus in us, what a wealth of motive would be lost!"[148]

It is on the basis of this tonic influence of fear that in some morbidly sensitive natures fear acts as a sexual stimulant. Cullerre has brought together a number of cases in both men and women, mostly neurasthenic, in which fits of extreme anxiety and dread, sometimes of a religious character and often in highly moral people, terminate in spontaneous orgasm or in masturbation.[149]

Professor Gurlitt mentions that his first full sexual emission took place in class at school, when he was absorbed in writing out the life of Aristides and very anxious lest he should not be able to complete it within the set time.[150]

Dread and anxiety not only excite sexual emotion, but in the more extreme morbid cases they may suppress and replace it. Terror, say Fliess, is transmuted coitus, and Freud believes that the neurosis of anxiety always has a sexual cause, while Ballet, Capgras, Löwenfeld, and others, though not regarding a sexual traumatism as the only cause, still regard it as frequent.

It is worthy of note that not only fear, but even so depressing an emotion as grief, may act as a sexual stimulant, more especially in women. This fact is not sufficiently recognized, though probably everyone can recall instances from his personal knowledge, such cases being generally regarded as inexplicable. It is, however, not more surprising that grief should be transformed into sexual emotion than that (as in a case recorded by Stanley Hall) it should manifest itself as anger. In any case we have to bear in mind the frequency of this psychological transformation in the presence of cases which might otherwise seem to call for a cynical

interpretation.

The case has been recorded of an English lady of good social position who fell in love with an undertaker at her father's funeral and insisted on marrying him. It is known that some men have been so abnormally excited by the funeral trappings of death that only in such surroundings have they been able to effect coitus. A case has been recorded of a physician of unimpeachable morality who was unable to attend funerals, even of his own relatives, on account of the sexual excitement thus aroused. Funerals, tragedies at the theater, pictures of martyrdom, scenes of execution, and trials at the law-courts have been grouped together as arousing pleasure in many people, especially women. (C.F. von Schlichtegroll, *Sacher-Masoch und der Masochismus*, pp. 30-31.) Wakes and similar festivals may here find their psychological basis, and funerals are an unquestionable source of enjoyment among some people, especially of so-called "Celtic" race. The stimulating reaction after funerals is well known to many, and Leigh Hunt refers to this (in his *Autobiography*) as affecting the sincerely devoted friends who had just cremated Shelley.

It may well be, as Kiernan has argued (*Alienist and Neurologist*, 1891; *ibid.*, 1902, p. 263), that in the disturbance of emotional balance caused by grief the primitive instincts become peculiarly apt to respond to stimulus, and that in the aboulia of grief the mind is specially liable to become the prey to obsessions.

"When my child died at the age of 6 months," a correspondent writes, "I had a violent paroxysm of weeping and for some days I could not eat. When I kissed the dead boy for the last time (I had never seen a corpse before) I felt I had reached the depths of misery and could never smile or have any deep emotions again. Yet that night, though my thoughts had not strayed to sexual subjects since the child's death, I had a violent erection. I felt ashamed to desire carnal things when my dead child was still in the house, and explained to my wife. She was sympathetic, for her idea was that our common grief had intensified my love for her. I feel convinced, however, that my desire was the result of a stimulus propagated to the sexual centers from the centers affected by my grief, the transference of my emotion from one set

of nerves to another. I do not perhaps express my meaning clearly."

How far the emotional influence of grief entered into the following episode it is impossible to say, for here it is probable that we are mainly concerned with one of those almost irresistible impulses by which adolescent girls are sometimes overcome. The narrative is from the lips of a reliable witness, a railway guard, who, some thirty years ago, when a youth of 18, in Cornwall, lodged with a man and woman who had a daughter of his own age. Some months later, when requiring a night's lodging, he called at the house, and was greeted warmly by the woman, who told him her husband had just died and that she and her daughter were very nervous and would be glad if he would stay the night, but that as the corpse occupied the other bedroom he would have to share their bed ("We don't think very much of that among us," my informant added). He agreed, and went to bed, and when, a little later, the two women also came to bed, the girl, at her own suggestion, lay next to the youth. Nothing happened during the night, but in the morning, when the mother went down to light the fire, the daughter immediately threw off the bedclothes, exposing her naked person, and before the youth had realized what was happening she had drawn him over on to her. He was so utterly surprised that nothing whatever happened, but the incident made a life-long impression on him.

In this connection reference may be made to the story of the Ephesian matron in Petronius; the story of the widow, overcome by grief, who watches by her husband's tomb, and very speedily falls into the arms of the soldier who is on guard. This story, in very various forms, is found in China and India, and has occurred repeatedly in European literature during the last two thousand years. The history of the wanderings of this story has been told by Grisebach (Eduard Grisebach, *Die Treulose Witwe*, third edition, 1877). It is not probable, however, that all the stories of this type are actually related; in any case it would seem that their vitality is due to the fact that they have been found to show a real correspondence to life; one may note, for instance, the curious tone of personal emotion with which George Chapman treated this theme in his play, *Widow's Tears*.

It may be added that, in explaining the resort to pain as an emotional

stimulus, we have to take into account not only the biological and psychological considerations here brought forward, but also the abnormal physiological conditions under which stimuli usually felt as painful come specially to possess a sexually exciting influence. The neurasthenic and neuropathic states may be regarded as conditions of more or less permanent fatigue. It is true that under the conditions we are considering there may be an extreme sensitiveness to stimuli not usually felt as of sexual character, a kind of hyperesthesia; but hyperesthesia, it has well been said, is nothing but the beginning of anesthesia.[151] Sergeant Bertrand, the classical example of necrophily,[152] began to masturbate at the age of 9, stimulating a sexual impulse which may have been congenitally feeble by accompanying thoughts of ill-treating women. It was not till subsequently that he began to imagine that the women were corpses. The sadistic thoughts were only incidents in the emotional evolution, and the real object throughout was to procure strong emotion and not to inflict cruelty. Some observations of Féré's as to the conditions which influence the amount of muscular work accomplished with the ergograph are instructive from the present point of view: "Although sensibility diminishes in the course of fatigue," Féré found that "there are periods during which the excitability increases before it disappears. As fatigue increases, the perception of the intercurrent excitation is retarded; an odor is perceived as exciting before it is perceived as a differentiated sensation; the most fetid odors arouse feelings of well-being before being perceived as odors, and their painful quality only appears afterward, or is not noticed at all." And after recording a series of results with the ergograph obtained under the stimulus of unpleasant odors he remarks: "We are thus struck by two facts: the diminution of work during painful excitation, and its increase when the excitation has ceased. When the effects following the excitation have disappeared the diminution is more rapid than in the ordinary state. When the fatigue is manifested by a notable diminution, if the same excitation is brought into action again, no diminution is produced, but a more or less durable increase, exactly as though there had been an agreeable excitation. Moreover, the stimulus which appears painful in a state of repose loses that painful character either partially or completely when acting on the same subject in a more and more fatigued state." Féré defines a painful stimulus as a strong excitation which causes displays of energy which the will cannot utilize; when, as a result of diminished sensibility, the excitants are attenuated, the will can utilize them, and so there is no pain.[153] These experiments had no reference to the sexual instinct, but it will be seen at once that they have an extremely significant bearing on the subject before us, for they show us the mechanism of the process by which in an abnormal organism

pain becomes a sexual stimulant.

VII.

Summary of Results Reached--The Joy of Emotional Expansion--The Satisfaction of the Craving for Power--The Influence of Neurasthenic and Neuropathic Conditions--The Problem of Pain in Love Largely Constitutes a Special Case of Erotic Symbolism.

It may seem to some that in our discussion of the relationships of love and pain we have covered a very wide field. This was inevitable. The subject is peculiarly difficult and complex, and if we are to gain a real insight into its nature we must not attempt to force the facts to fit into

any narrow and artificial formulas of our own construction. Yet, as we have unraveled this seemingly confused mass of phenomena it will not have escaped the careful reader that the apparently diverse threads we have disentangled run in a parallel and uniform manner; they all have a like source and they all converge to a like result. We have seen that the starting-point of the whole group of manifestations must be found in the essential facts of courtship among animal and primitive human societies. Pain is seldom very far from some of the phases of primitive courtship; but it is not the pain which is the essential element in courtship, it is the state of intense emotion, of tumescence, with which at any moment, in some shape or another, pain may, in some way or another, be brought into connection. So that we have come to see that in the phrase "love and pain" we have to understand by "pain" a state of intense emotional excitement with which pain in the stricter sense may be associated, but is by no means necessarily associated. It is the strong emotion which exerts the irresistible fascination in the lover, in his partner, or in both. The pain is merely the means to that end. It is the lever which is employed to bring the emotional force to bear on the sexual impulse. The question of love and pain is mainly a question of emotional dynamics.

In attaining this view of our subject we have learned that any impulse of true cruelty is almost outside the field altogether. The mistake was indeed obvious and inevitable. Let us suppose that every musical instrument is sensitive and that every musical performance involves the infliction of pain on the instrument. It would then be very difficult indeed to realize that the pleasure of music lies by no means in the infliction of pain. We should certainly find would-be scientific and analytical people ready to declare that the pleasure of music is the pleasure of giving pain, and that the emotional effects of music are due to the pain thus inflicted. In algolagnia, as in music, it is not cruelty that is sought; it is the joy of being plunged among the waves of that great primitive ocean of emotions which underlies the variegated world of our everyday lives, and pain--a pain which, as we have seen, is often deprived so far as possible of cruelty, though sometimes by very thin and feeble devices--is merely the channel by which that ocean is reached.

If we try to carry our inquiry beyond the point we have been content to reach, and ask ourselves why this emotional intoxication exerts so irresistible a fascination, we might find a final reply in the explanation of Nietzsche--who regarded this kind of intoxication as of great significance both in life and in art--that it gives us the consciousness of energy and the satisfaction of our craving for power.[154] To carry the

inquiry to this point would be, however, to take it into a somewhat speculative and metaphysical region, and we have perhaps done well not to attempt to analyze further the joy of emotional expansion. We must be content to regard the profound satisfaction of emotion as due to a widespread motor excitement, the elements of which we cannot yet completely analyze.[155]

It is because the joy of emotional intoxication is the end really sought that we have to regard the supposed opposition between "sadism" and "masochism" as unimportant and indeed misleading. The emotional value of pain is equally great whether the pain is inflicted, suffered, witnessed, or merely exists as a mental imagination, and there is no reason why it should not coexist in all these forms in the same person, as, in fact, we frequently find it.

The particular emotions which are invoked by pain to reinforce the sexual impulse are more especially anger and fear, and, as we have seen, these two very powerful and primitive emotions are--on the active and passive sides, respectively--the emotions most constantly brought into play in animal and early human courtship; so that they naturally constitute the emotional reservoirs from which the sexual impulse may still most easily draw. It is not difficult to show that the various forms in which "pain"--as we must here understand pain--is employed in the service of the sexual impulse are mainly manifestations or transformations of anger or fear, either in their simple or usually more complex forms, in some of which anger and fear may be mingled.

We thus accept the biological origin of the psychological association between love and pain; it is traceable to the phenomena of animal courtship. We do not on this account exclude the more direct physiological factor. It may seem surprising that manifestations that have their origin in primeval forms of courtship should in many cases coincide with actual sensations of definite anatomical base today, and still more surprising that these traditional manifestations and actual sensations should so often be complementary to each other in their active and passive aspects: that is to say, that the pleasure of whipping should be matched by the pleasure of being whipped, the pleasure of mock strangling by the pleasure of being so strangled, that pain inflicted is not more desirable than pain suffered. But such coincidence is of the very essence of the whole group of phenomena. The manifestations of courtship were from the first conditioned by physiological facts; it is not strange that they should always tend to run *_pari passu_* with physiological facts. The

manifestations which failed to find anchorage in physiological relationships might well tend to die out. Even under the most normal circumstances, in healthy persons of healthy heredity, the manifestations we have been considering are liable to make themselves felt. Under such circumstances, however, they never become of the first importance in the sexual process; they are often little more than play. It is only under neurasthenic or neuropathic conditions--that is to say, in an organism which from acquired or congenital causes, and usually perhaps both, has become enfeebled, irritable, "fatigued"--that these manifestations are liable to flourish vigorously, to come to the forefront of sexual consciousness, and even to attain such seriously urgent importance that they may in themselves constitute the entire end and aim of sexual desire. Under these pathological conditions, pain, in the broad and special sense in which we have been obliged to define it, becomes a welcome tonic and a more or less indispensable stimulant to the sexual system.

It will not have escaped the careful reader that in following out our subject we have sometimes been brought into contact with manifestations which scarcely seem to come within any definition of pain. This is undoubtedly so, and the references to these manifestations were not accidental, for they serve to indicate the real bearings of our subject. The relationships of love and pain constitute a subject at once of so much gravity and so much psychological significance that it was well to devote to them a special study. But pain, as we have here to understand it, largely constitutes a special case of what we shall later learn to know as erotic symbolism: that is to say, the psychic condition in which a part of the sexual process, a single idea or group of ideas, tends to assume unusual importance, or even to occupy the whole field of sexual consciousness, the part becoming a symbol that stands for the whole. When we come to the discussion of this great group of abnormal sexual manifestations it will frequently be necessary to refer to the results we have reached in studying the sexual significance of pain.

FOOTNOTES:

[154] See, for instance, the section "Zur Physiologie der Kunst" in Nietzsche's fragmentary work, *Der Wille zur Macht*, Werke, Bd. xv. Groos (*Spiele der Menschen*, p. 89) refers to the significance of the fact that nearly all races have special methods of procuring intoxication. Cf. Partridge's study of the psychology of alcohol (*American Journal of Psychology*, April, 1900). "It is hard to imagine," this writer remarks of

intoxicants, "what the religious or social consciousness of primitive man would have been without them."

[155] The muscular element is the most conspicuous in emotion, though it is not possible, as a careful student of the emotions (H.R. Marshall, Pain, Pleasure, and Æsthetics, p. 84) well points out, "to limit the physical activities involved with the emotions to such effects of voluntary innervation or alteration of size of blood-vessels or spasm of organic muscle, as Lange seems to think determines them; nor to increase or decrease of muscle-power, as Féré's results might suggest; nor to such changes, in relation of size of capillaries, in voluntary innervation, in respiratory and heart functioning, as Lehmann has observed. Emotions seem to me to be coincidents of reactions of the whole organism tending to certain results."

THE SEXUAL IMPULSE IN WOMEN.

A special and detailed study of the normal characters of the sexual impulse in men seems unnecessary. I have elsewhere discussed various aspects of the male sexual impulse, and others remain for later discussion. But to deal with it broadly as a whole seems unnecessary, if only because it is predominantly open and aggressive. Moreover, since the constitution of society has largely been in the hands of men, the nature of the sexual impulse in men has largely been expressed in the written and unwritten codes of social law. The sexual instinct in women is much more elusive. This, indeed, is involved at the outset in the organic psychological play of male and female, manifesting itself in the phenomena of modesty and courting. The same elusiveness, the same mocking mystery, meet us throughout when we seek to investigate the manifestations of the sexual impulse in women. Nor is it easy to find any full and authentic record of a social state clearly founded in sexual matters on the demands of woman's nature.

An illustration of our ignorance and bias in these matters is furnished by the relationship of marriage, celibacy, and divorce to suicide in the two sexes. There can be no doubt that the sexual emotions of women have a profound influence in determining suicide. This is indicated, among other facts, by a comparison of

the suicide-rate in the sexes according to age; while in men the frequency of suicide increases progressively throughout life, in women there is an arrest after the age of 30; that is to say, when the period of most intense sexual emotion has been passed. This phenomenon is witnessed among peoples so unlike as the French, the Prussians, and the Italians. Now, how do marriage and divorce affect the sexual liability to suicide? We are always accustomed to say that marriage protects women, and it is even asserted that men have self-sacrificingly maintained the institution of marriage mainly for the benefit of women. Professor Durkheim, however, who has studied suicide elaborately from the sociological standpoint, so far as possible eliminating fallacies, has in recent years thrown considerable doubt on the current assumption. He shows that if we take the tendency to suicide as a test, and eliminate the influence of children, who are an undoubted protection to women, it is not women, but men, who are protected by marriage, and that the protection of women from suicide increases regularly as divorces increase. After discussing these points exhaustively, "we reach a conclusion," he states, "considerably removed from the current view of marriage and the part it plays. It is regarded as having been instituted for the sake of the wife and to protect her weakness against masculine caprices. Monogamy, especially, is very often presented as a sacrifice of man's polygamous instincts, made in order to ameliorate the condition of woman in marriage. In reality, whatever may have been the historical causes which determined this restriction, it is man who has profited most. The liberty which he has thus renounced could only have been a source of torment to him. Woman had not the same reasons for abandoning freedom, and from this point of view we may say that in submitting to the same rule it is she who has made the sacrifice." (E. Durkheim, *Le Suicide*, 1897, pp. 186-214, 289-311.)

There is possibly some significance in the varying incidence of insanity in unmarried men and unmarried women as compared with the married. At Erlangen, for example, Hagen found that among insane women the preponderance of the single over the married is not nearly so great as among insane men, marriage appearing to exert a much more marked prophylactic influence in the case of men than of women. (F.W. Hagen, *Statistische Untersuchungen über Geisteskrankheiten*, 1876, p. 153.) The phenomena are here,

however, highly complex, and, as Hagen himself points out, the prophylactic influence of marriage, while very probable, is not the only or even the chief factor at work.

It is worth noting that exactly the same sexual difference may be traced in England. It appears that, in ratio to similar groups in the general population (taking the years 1876-1900, inclusive), the number of admissions to asylums is the same for both sexes among married people (i.e., 8.5), but for the single it is larger among the men (4.8 to 4.5), as also it is among the widowed (17.9 to 13.9) (_Fifty-sixth Annual Report of the Commissioners in Lunacy, England and Wales_, 1902, p. 141). This would seem to indicate that when living apart from men the tendency to insanity is less in women, but is raised to the male level when the sexes live together in marriage.

Much the same seems to hold true of criminality. It was long since noted by Horsley that in England marriage decidedly increases the tendency to crime in women, though it decidedly decreases it in men. Prinzing has shown (_Zeitschrift für Sozialwissenschaft_, Bd. ii, 1899) that this is also the case in Germany.

Similarly marriage decreases the tendency of men to become habitual drunkards and increases that of women. Notwithstanding the fact that the average age of the men is greater than that of the women, the majority of the men admitted to the inebriate reformatories under the English Inebriates Acts are single; the majority of the women are married; of 865 women so admitted 32 per cent, were single, 50 per cent, married, and 18 per cent, widows. (_British Medical Journal_, Sept. 2, 1911, p. 518.)

It thus happens that even the elementary characters of the sexual impulse in women still arouse, even among the most competent physiological and medical authorities,--not least so when they are themselves women,--the most divergent opinions. Its very existence even may be said to be questioned. It would generally be agreed that among men the strength of the sexual impulse varies within a considerable range, but that it is very rarely altogether absent, such total absence being abnormal and probably more or less pathological. But if applied to women, this statement is by no means always accepted. By many, sexual anesthesia is considered natural in women, some even declaring that any other opinion would be degrading to

women; even by those who do not hold this opinion it is believed that there is an unnatural prevalence of sexual frigidity among civilized women. On these grounds it is desirable to deal generally with this and other elementary questions of allied character.

I.

The Primitive View of Women--As a Supernatural Element in Life--As Peculiarly Embodying the Sexual Instinct--The Modern Tendency to Underestimate the Sexual Impulse in Women--This Tendency Confined to Recent Times--Sexual Anæsthesia--Its Prevalence--Difficulties in Investigating the Subject--Some Attempts to Investigate it--Sexual Anesthesia must be Regarded as Abnormal--The Tendency to Spontaneous Manifestations of the Sexual Impulse in Young Girls at Puberty.

From very early times it seems possible to trace two streams of opinion regarding women: on the one hand, a tendency to regard women as a supernatural element in life, more or less superior to men, and, on the other hand, a tendency to regard women as especially embodying the sexual instinct and as peculiarly prone to exhibit its manifestations.

In the most primitive societies, indeed, the two views seem to be to some extent amalgamated; or, it should rather be said, they have not yet been differentiated; and, as in such societies it is usual to venerate the generative principle of nature and its embodiments in the human body and in human functions, such a co-ordination of ideas is entirely rational. But with the development of culture the tendency is for this homogeneous conception to be split up into two inharmonious tendencies. Even apart from Christianity and before its advent this may be noted. It was, however, to Christianity and the Christian ascetic spirit that we owe the complete differentiation and extreme development which these opposing views have reached. The condemnation of sexuality involved the glorification of the virgin; and indifference, even contempt, was felt for the woman who exercised sexual functions. It remained open to anyone, according to his own temperament, to identify the typical average woman with the one or with the other type; all the fund of latent sexual emotion which no ascetic rule can crush out of the human heart assured the picturesque idealization alike of the angelic and the diabolic types of

woman. We may trace the same influence subtly lurking even in the most would-be scientific statements of anthropologists and physicians today.[156]

It may not be out of place to recall at this point, once more, the fact, fairly obvious indeed, that the judgments of men concerning women are very rarely matters of cold scientific observation, but are colored both by their own sexual emotions and by their own moral attitude toward the sexual impulse. The ascetic who is unsuccessfully warring with his own carnal impulses may (like the voluptuary) see nothing in women but incarnations of sexual impulse; the ascetic who has subdued his own carnal impulses may see no elements of sex in women at all. Thus the opinions regarding this matter are not only tinged by elements of primitive culture, but by elements of individual disposition. Statements about the sexual impulses of women often tell us less about women than about the persons who make them.

The curious manner in which for men women become incarnations of the sexual impulse is shown by the tendency of both general and personal names for women to become applicable to prostitutes only. This is the case with the words "garce" and "fille" in French, "Mädchen" and "Dirne" in German, as well as with the French "catin" (Catherine) and the German "Metze" (Mathilde). (See, e.g., R. Kleinpaul, *Die Räthsel der Sprache*, 1890, pp. 197-198.)

At the same time, though we have to recognize the presence of elements which color and distort in various ways the judgments of men regarding women, it must not be hastily assumed that these elements render discussion of the question altogether unprofitable. In most cases such prejudices lead chiefly to a one-sided solution of facts, against which we can guard.

While, however, these two opposing currents of opinion are of very ancient origin, it is only within quite recent times, and only in two or three countries, that they have led to any marked difference of opinion regarding the sexual aptitude of women. In ancient times men blamed women for concupiscence or praised them for chastity, but it seems to have been reserved for the nineteenth century to state that women are apt to be congenitally incapable of experiencing complete sexual satisfaction, and peculiarly liable to sexual anesthesia. This idea appears to have been

almost unknown to the eighteenth century. During the last century, however, and more especially in England, Germany, and Italy, this opinion has been frequently set down, sometimes even as a matter of course, with a tincture of contempt or pity for any woman afflicted with sexual emotions.

In the treatise *_On Generation_* (chapter v), which until recent times was commonly ascribed to Hippocrates, it is stated that men have greater pleasure in coitus than women, though the pleasure of women lasts longer, and this opinion, though not usually accepted, was treated with great respect by medical authors down to the end of the seventeenth century. Thus A. Laurentius (Du Laurens), after a long discussion, decides that men have stronger sexual desire and greater pleasure in coitus than women. (*_Historia Anatomica Humani Corporis_*, 1599, lib. viii, quest, ii and vii.)

About half a century ago a book entitled *_Functions and Disorders of the Reproductive Organs_*, by W. Acton, a surgeon, passed through many editions and was popularly regarded as a standard authority on the subjects with which it deals. This extraordinary book is almost solely concerned with men; the author evidently regards the function of reproduction as almost exclusively appertaining to men. Women, if "well brought up," are, and should be, he states, in England, absolutely ignorant of all matters concerning it. "I should say," this author again remarks, "that the majority of women (happily for society) are not very much troubled with sexual feeling of any kind." The supposition that women do possess sexual feelings he considers "a vile aspersion."

In the article "Generation," contained in another medical work belonging to the middle of the nineteenth century,--Rees's *_Cyclopedia_*,--we find the following statement: "That a mucous fluid is sometimes found in coition from the internal organs and vagina is undoubted; but this only happens in lascivious women, or such as live luxuriously."

Gall had stated decisively that the sexual desires of men are stronger and more imperious than those of women. (*_Fonctions du Cerveau_*, 1825, vol. iii, pp. 241-271.)

Raciborski declared that three-fourths of women merely endure the approaches of men. (*_De la Puberté chez la Femme_*, 1844, p. 486.)

"When the question is carefully inquired into and without prejudice," said Lawson Tait, "it is found that women have their sexual appetites far less developed than men." (Lawson Tait, "Remote Effects of Removal of the Uterine Appendages," Provincial Medical Journal, May, 1891.) "The sexual instinct is very powerful in man and comparatively weak in women," he stated elsewhere (Diseases of Women, 1889, p. 60).

Hammond stated that, leaving prostitutes out of consideration, it is doubtful if in one-tenth of the instances of intercourse they [women] experience the slightest pleasurable sensation from first to last (Hammond, Sexual Impotence, p. 300), and he considered (p. 281) that this condition was sometimes congenital.

Lombroso and Ferrero consider that sexual sensibility, as well as all other forms of sensibility, is less pronounced in women, and they bring forward various facts and opinions which seem to them to point in the same direction. "Woman is naturally and organically frigid." At the same time they consider that, while erethism is less, sexuality is greater than in men. (Lombroso and Ferrero, La Donna Delinquente, la Prostituta, e la Donna Normale, 1893, pp. 54-58.)

"It is an altogether false idea," Fehling declared, in his rectorial address at the University of Basel in 1891, "that a young woman has just as strong an impulse to the opposite sex as a young man.... The appearance of the sexual side in the love of a young girl is pathological." (H. Fehling, Die Bestimmung der Frau, 1892, p. 18.) In his Lehrbuch der Frauenkrankheiten the same gynecological authority states his belief that half of all women are not sexually excitable.

Krafft-Ebing was of opinion that women require less sexual satisfaction than men, being less sensual. (Krafft-Ebing, "Ueber Neurosen und Psychosen durch sexuelle Abstinenz," Jahrbücher für Psychiatrie, 1888, Bd. viii, ht. I and 2.)

"In the normal woman, especially of the higher social classes," states Windscheid, "the sexual instinct is acquired, not inborn; when it is inborn, or awakes by itself, there is abnormality. Since women do not know this instinct before marriage, they do

not miss it when they have no occasion in life to learn it." (F. Windscheid, "Die Beziehungen zwischen Gynäkologie und Neurologie," Zentralblatt für Gynäkologie, 1896, No. 22; quoted by. Moll, Libido Sexualis, Bd. i, p. 271.)

"The sensuality of men," Moll states, "is in my opinion very much greater than that of women." (A. Moll, Die Konträre Sexualempfindung, third edition, 1899, p. 592.)

"Women are, in general, less sensual than men," remarks Näcke, "notwithstanding the alleged greater nervous supply of their sexual organs." (P. Näcke, "Kritisches zum Kapitel der Sexualität," Archiv für Psychiatrie, 1899, p. 341.)

Löwenfeld states that in normal young girls the specifically sexual feelings are absolutely unknown; so that desire cannot exist in them. Putting aside the not inconsiderable proportion of women in whom this absence of desire may persist and be permanent, even after sexual relationships have begun, thus constituting absolute frigidity, in a still larger number desire remains extremely moderate, constituting a state of relative frigidity. He adds that he cannot unconditionally support the view of Fürbringer, who is inclined to ascribe sexual coldness to the majority of German married women. (L. Löwenfeld, Sexualleben und Nervenleiden, 1899, second edition, p. 11.)

Adler, who discusses the question at some length, decides that the sexual needs of women are less than those of men, though in some cases the orgasm in quantity and quality greatly exceeds that of men. He believes, not only that the sexual impulse in women is absolutely less than in men, and requires stronger stimulation to arouse it, but that also it suffers from a latency due to inhibition, which acts like a foreign body in the brain (analogous to the psychic trauma of Breuer and Freud in hysteria), and demands great skill in the man who is to awaken the woman to love. (O. Adler, Die Mangelhafte Geschlechtsempfindung des Weibes, 1904, pp. 47, 126 et seq.; also enlarged second edition, 1911; id., "Die Frigide Frau," Sexual-Probleme, Jan., 1912.)

It must not, however, be supposed that this view of the natural tendency of women to frigidity has everywhere found acceptance. It is not only an

opinion of very recent growth, but is confined, on the whole, to a few countries.

"Turn to history," wrote Brierre de Boismont, "and on every page you will be able to recognize the predominance of erotic ideas in women." It is the same today, he adds, and he attributes it to the fact that men are more easily able to gratify their sexual impulses. (_Des Hallucinations_, 1862, p. 431.)

The laws of Manu attribute to women concupiscence and anger, the love of bed and of adornment.

The Jews attributed to women greater sexual desire than to men. This is illustrated, according to Knobel (as quoted by Dillmann), by _Genesis_, chapter iii, v. 16.

In Greek antiquity the romance and sentiment of love were mainly felt toward persons of the same sex, and were divorced from the more purely sexual feelings felt for persons of opposite sex. Theognis compared marriage to cattle-breeding. In love between men and women the latter were nearly always regarded as taking the more active part. In all Greek love-stories of early date the woman falls in love with the man, and never the reverse. Æschylus makes even a father assume that his daughters will misbehave if left to themselves. Euripides emphasized the importance of women; "The Euripidean woman who 'falls in love' thinks first of all: 'How can I seduce the man I love?'" (E.F.M. Benecke, _Antimachus of Colophon and the Position of Women in Greek Poetry_, 1896, pp. 34, 54.)

The most famous passage in Latin literature as to the question of whether men or women obtain greater pleasure from sexual intercourse is that in which Ovid narrates the legend of Tiresias (_Metamorphoses_, iii, 317-333). Tiresias, having been both a man and a woman, decided in favor of women. This passage was frequently quoted down to the eighteenth century.

In a passage quoted from a lost work of Galen by the Arabian biographer, Abu-l-Faraj, that great physician says of the Christians "that they practice celibacy, that even many of their women do so." So that in Galen's opinion it was more difficult for a woman than for a man to be continent.

The same view is widely prevalent among Arabic authors, and there is an Arabic saying that "The longing of the woman for the penis is greater than that of the man for the vulva."

In China, remarks Dr. Coltman, "when an old gentleman of my acquaintance was visiting me my little daughter, 5 years old, ran into the room, and, climbing upon my knee, kissed me. My visitor expressed his surprise, and remarked: 'We never kiss our daughters when they are so large; we may when they are very small, but not after they are 3 years old,' said he, 'because it is apt to excite in them bad emotions.'" (Coltman, *The Chinese*, 1900, p. 99.)

The early Christian Fathers clearly show that they regard women as more inclined to sexual enjoyment than men. That was, for instance, the opinion of Tertullian (*De Virginibus Velandis*, chapter x), and it is clearly implied in some of St. Jerome's epistles.

Notwithstanding the influence of Christianity, among the vigorous barbarian races of medieval Europe, the existence of sexual appetite in women was not considered to be, as it later became, a matter to be concealed or denied. Thus in 1068 the ecclesiastical historian, Ordericus Vitalis (himself half Norman and half English), narrates that the wives of the Norman knights who had accompanied William the Conqueror to England two years earlier sent over to their husbands to say that they were consumed by the fierce names of desire ("sæva libidinis face urebantur"), and that if their husbands failed to return very shortly they proposed to take other husbands. It is added that this threat brought a few husbands back to their wanton ladies ("lascivis dominabus suis").

During the medieval period in Europe, largely in consequence, no doubt, of the predominance of ascetic ideals set up by men who naturally regarded woman as the symbol of sex, the doctrine of the incontinence of woman became firmly fixed, and it is unnecessary and unprofitable to quote examples. It is sufficient to mention the very comprehensive statement of Jean de Meung (in the *Roman de la Rose*, 9903):--

"Toutes estes, serés, ou fûtes
De fait ou de volonté putes."

The satirical Jean de Meung was, however, a somewhat extreme and untypical representative of his age, and the fourteenth century Johannes de Sancto Amando (Jean de St. Amand) gives a somewhat more scientifically based opinion (quoted by Pagel, *Neue litterarische Beiträge zur Mittelalterlichen Medicin*, 1896, p. 30) that sexual desire is stronger in women than in men.

Humanism and the spread of the Renaissance movement brought in a spirit more sympathetic to women. Soon after, especially in Italy and France, we begin to find attempts at analyzing the sexual emotions, which are not always without a certain subtlety. In the seventeenth century a book of this kind was written by Venette. In matters of love, Venette declared, "men are but children compared to women. In these matters women have a more lively imagination, and they usually have more leisure to think of love. Women are much more lascivious and amorous than men." This is the conclusion reached in a chapter devoted to the question whether men or women are the more amorous. In a subsequent chapter, dealing with the question whether men or women receive more pleasure from the sexual embrace, Venette concludes, after admitting the great difficulty of the question, that man's pleasure is greater, but woman's lasts longer. (N. Venette, *De la Génération de l'Homme ou Tableau de l'Amour Conjugal*, Amsterdam, 1688.)

At a much earlier date, however, Montaigne had discussed this matter with his usual wisdom, and, while pointing out that men have imposed their own rule of life on women and their own ideals, and have demanded from them opposite and contradictory virtues,--a statement not yet antiquated,--he argues that women are incomparably more apt and more ardent in love than men are, and that in this matter they always know far more than men can teach them, for "it is a discipline that is born in their veins." (Montaigne, *Essais*, book iii, chapter v.)

The old physiologists generally mentioned the appearance of sexual desire in girls as one of the normal signs of puberty. This may be seen in the numerous quotations brought together by Schurig, in his *Parthenologia*, cap. ii.

A long succession of distinguished physicians throughout the seventeenth century discussed at more or less length the relative amount of sexual desire in men and women, and the relative degree of their pleasure in coitus. It is remarkable that, although they usually attach great weight to the supposed opinion of Hippocrates in the opposite sense, most of them decide that both desire and pleasure are greater in women.

Plazzonus decides that women have more sources of pleasure in coitus than men because of the larger extent of surface excited; and if it were not so, he adds, women would not be induced to incur the pains and risks of pregnancy and childbirth. (Plazzonus, *_De Partibus Generationi Inservientibus_*, 1621, lib. ii, cap. xiii.)

"Without doubt," says Ferrand, "woman is more passionate than man, and more often torn by the evils of love." (Ferrand, *_De la Maladie d'Amour_*, 1623, chapter ii.)

Zacchia, mainly on *_a priori_* grounds, concludes that women have more pleasure in coitus than men. (Zacchia, *_Quæstiones Medico-legales_*, 1630, lib. iii, quest, vii.)

Sinibaldus, discussing whether men or women have more salacity, decides in favor of women. (J.B. Sinibaldus, *_Geneanthropeia_*, 1642, lib. ii, tract. ii, cap. v.)

Hornius believed that women have greater sexual pleasure than men, though he mainly supported his opinion by the authority of classical poets. (Hornius, *_Historic Naturalis_*, 1670, lib. iii, cap. i.)

Nenter describes what we may now call women's affectability, and considers that it makes them more prone than men to the sexual emotions, as is shown by the fact that, notwithstanding their modesty, they sometimes make sexual advances. This greater proneness of women to the sexual impulse is, he remarks, entirely natural and right, for the work of generation is mainly carried on by women, and love is its basis: "generationis fundamentum est amor." (G.P. Nenter, *_Theoria Hominis Sani_*, 1714, cap. v, memb. ii.)

The above opinions of seventeenth-century physicians are quoted from the original sources. Schurig, in his *_Gynæcologia_*, (pp. 46-50 and 71-81), quotes a number of passages on this subject from medical authorities of the same period, on which I have not drawn.

Sénancour, in his fine and suggestive book on love, first published in 1806, asks: "Has sexual pleasure the same power on the sex which less loudly demands it? It has more, at all events in some respects. The very vigor and laboriousness of men may lead them to neglect love, but the constant cares of maternity make women feel how important it must ever be to them. We must remember also that in men the special emotions of love only have a single focus, while in women the organs of lactation are united to those of conception. Our feelings are all determined by these material causes." (Sénancour, *_De l'Amour_*, fourth edition, 1834, vol. i, p. 68.) A later psychologist of love, this time a woman, Ellen Key, states that woman's erotic demands, though more silent than man's, are stronger. (Ellen Key, *_Ueber Liebe und Ehe_*, p. 138.)

Michael Ryan considered that sexual enjoyment "is more delicious and protracted" in women, and ascribed this to a more sensitive nervous system, a finer and more delicate skin, more acute feelings, and the fact that in women the *mammæ* are the seat of a vivid sensibility in sympathy with the uterus. (M. Ryan, *_Philosophy of Marriage_*, 1837, p. 153.)

Busch was inclined to think women have greater sexual pleasure than men. (D.W.H. Busch, *_Das Geschlechtsleben des Weibes_*, 1839, vol. i, p. 69.) Kobelt held that the anatomical conformation of the sexual organs in women led to the conclusion that this must be the case.

Guttceit, speaking of his thirty years' medical experience in Russia, says: "In Russia at all events, a girl, as very many have acknowledged to me, cannot resist the ever stronger impulses of sex beyond the twenty-second or twenty-third year. And if she cannot do so in natural ways she adopts artificial ways. The belief that the feminine sex feels the stimulus of sex less than the male is quite false." (Guttceit, *_Dreissig Jahre Praxis_*,

1873, theil i, p. 313.)

In Scandinavia, according to Vedeler, the sexual emotions are at least as strong in women as in men (Vedeler, "De Impotentia Feminarum," *_Norsk Magazin for Laegevidenskaben_*, March, 1894). In Sweden, Dr. Eklund, of Stockholm, remarking that from 25 to 33 per cent. of the births are illegitimate, adds: "We hardly ever hear anyone talk of a woman having been seduced, simply because the lust is at the worst in the woman, who, as a rule, is the seducing party." (Eklund, *_Transactions of the American Association of Obstetricians_*, Philadelphia, 1892, p. 307.)

On the opposite side of the Baltic, in the Königsberg district, the same observation has been made. Intercourse before marriage is the rule in most villages of this agricultural district, among the working classes, with or without intention of subsequent marriage; "the girls are often the seducing parties, or at least very willing; they seek to bind their lovers to them and compel them to marriage." In the Köslin district of Pomerania, where intercourse between the girls and youths is common, the girls come to the youths' rooms even more frequently than the youths to the girls'. In some of the Dantzic districts the girls give themselves to the youths, and even seduce them, sometimes, but not always, with a view of marriage. (Wittenberg, *_Die geschlechtsittlichen Verhalten der Landbewohner im Deutschen Reiche_*, 1895, Bd. i, pp. 47, 61, 83.)

Mantegazza devoted great attention to this point in several of the works he published during fifty years, and was decidedly of the opinion that the sexual emotions are much stronger in women than in men, and that women have much more enjoyment in sexual intercourse. In his *_Fisiologia del Piacere_* he supports this view, and refers to the greater complexity of the genital apparatus in women (as well as its larger surface and more protected position), to what he considers to be the keener sensibility of women generally, to the passivity of women, etc.; and he considers that sexual pleasure is rendered more seductive to women by the mystery in which it is veiled for them by modesty and our social habits. In a more recent work (*_Fisiologia della Donna_*, cap. viii) Mantegazza returns to this subject, and remarks that long experience, while confirming his early opinion, has modified it to the extent that he now believes that, as

compared with men, the sexual emotions of women vary within far wider limits. Among men few are quite insensitive to the physical pleasures of love, while, on the other hand, few are thrown by the violence of its emotional manifestations into a state of syncope or convulsions. Among women, while some are absolutely insensitive, others (as in cases with which he was acquainted) are so violently excited by the paradise of physical love that, after the sexual embrace, they faint or fall into a cataleptic condition for several hours.

"Physical sex is a larger factor in the life of the woman.... If this be true of the physical element, it is equally true of the mental element." (Dr. Elizabeth Blackwell, *The Human Element in Sex*, fifth edition, 1894, p. 47.)

"In the female sex," remarks Clouston, "reproduction is a more dominant function of the organism than in the male, and has far larger, if not more intense, relationships to feeling, judgment, and volition." (Clouston, *Neuroses of Development*, 1891.)

"It may be said," Marro states, "that in woman the visceral system reacts, if not with greater intensity, certainly in a more general manner, to all the impressions, having a sexual basis, which dominate the life of woman, if not as sexual emotions properly so called, as related emotions closely dependent on the reproductive instinct." (A. Marro, *La Pubertà*, 1898, p. 233.)

Forel also believed (*Die Sexuelle Frage*, p. 274) that women are more erotic than men.

The gynecologist Kisch states his belief that "The sexual impulse is so powerful in women that at certain periods of life its primitive force dominates her whole nature, and there can be no room left for reason to argue concerning reproduction; on the contrary, union is desired even in the presence of the fear of reproduction or when there can be no question of it." He regards absence of sexual feeling in women as pathological. (Kisch, *Sterilität des Weibes*, second edition, pp. 205-206.) In his later work (*The Sexual Life of Woman*) Kisch again asserts that sexual impulse always exists in mature women (in the absence of organic sexual defect and cerebral disease), though it varies in strength and may be repressed. In adolescent girls, however, it

is weaker than in youths of the same age. After she has had sexual experiences, Kisch maintains, a woman's sexual emotions are just as powerful as a man's, though she has more motives than a man for controlling them.

Eulenburg is of the same opinion as Kisch, and sharply criticises the loose assertion of some authorities who have expressed themselves in an opposite sense. (A. Eulenburg, *Sexuale Neuropathie*, pp. 88-90; the same author has dealt with the point in the *Zukunft*, December 2, 1893.)

Kossmann states that the opinion as to the widespread existence of frigidity among women is a fable. (Kossmann, *Allgemeine Gynäcologie*, 1903, p. 362.)

Bloch concludes that "in most cases the sexual coldness of women is in fact only apparent, either due to the concealment of glowing sexuality beneath the veil of outward reticence prescribed by conventional morality, or else to the husband who has not succeeded in arousing erotic sensations which are complicated and with difficulty awakened.... The sexual sensibility of women is certainly different from that of men, but in strength it is at least as great." (Iwan Bloch, *Das Sexualleben unserer Zeit* 1907, ch. v.)

Nyström, also, after devoting a chapter to the discussion of the causes of sexual coldness in women, concludes: "My conviction, founded on experience, is, that only a small number of women would be without sexual feeling if sound views and teaching prevailed in respect to the sexual life, if due weight were given to inner devotion and tender caresses as the preliminaries of love in marriage, and if couples who wish to avoid pregnancy would adopt sensible preventive methods instead of *coitus interruptus*." (A. Nyström, *Das Geschlechtsleben und seine Gesetze*, eighth edition, 1907, p. 177.)

We thus find two opinions widely current: one, of world-wide existence and almost universally accepted in those ages and centers in which life is lived most nakedly, according to which the sexual impulse is stronger in women than in men; another, now widely prevalent in many countries, according to which the sexual instinct is distinctly weaker in women, if, indeed, it may not be regarded as normally absent altogether. A third view

is possible: it may be held that there is no difference at all. This view, formerly not very widely held, is that of the French physiologist, Beaunis, as it is of Winckel; while Rohleder, who formerly held that sexual feeling tends to be defective in women, now believes that men and women are equal in sexual impulse.

At an earlier period, however, Donatus (*_De Medica Historia Mirabili_*, 1613, lib. iv, cap. xvii) held the same view, and remarked that sometimes men and sometimes women are the more salacious, varying with the individual. Roubaud (*_De l'Impuissance_*, 1855, p. 38) stated that the question is so difficult as to be insoluble.

In dealing with the characteristics of the sexual impulse in women, it will be seen, we have to consider the prevalence in them of what is commonly termed (in its slightest forms) frigidity or hyphedonia, and (in more complete form) sexual anesthesia or anaphrodism, or erotic blindness, or anhedonia.[157]

Many modern writers have referred to the prevalence of frigidity among women. Shufeldt believes (*_Pacific Medical Journal_*, Nov., 1907) that 75 per cent, of married women in New York are afflicted with sexual frigidity, and that it is on the increase; it is rare, however, he adds, among Jewish women. Hegar gives 50 per cent, as the proportion of sexually anesthetic women; Fürbringer says the majority of women are so. Effertz (quoted by Löwenfeld, *_Sexualleben und Nervenleiden_*, p. 11, apparently with approval) regards 10 per cent, among women generally as sexually anesthetic, but only 1 per cent, men. Moll states (Eulenburg's *_Encyclopädie_*, fourth edition, art. "Geschlechtstrieb") that the prevalence of sexual anesthesia among German women varies, according to different authorities, from 10 to 66 per cent. Elsewhere Moll (*_Konträre Sexualempfindung_*, third edition, 1890, p. 510) emphasizes the statement that "sexual anesthesia in women is much more frequent than is generally supposed." He explains that he is referring to the physical element of pleasure and satisfaction in intercourse, and of desire for intercourse. He adds that the psychic side of love is often more conspicuous in women than in men. He cannot agree with Sollier that this kind of sexual frigidity is a symptom of hysteria. Féré (*_L'Instinct Sexuel_*, second edition, p. 112), in referring to the greater frequency of sexual anesthesia in women, remarks that it is often

associated with neuropathic states, as well as with anomalies of the genital organs, or general troubles of nutrition, and is usually acquired. Some authors attribute great importance to amenorrhea in this connection; one investigator has found that in 4 out of 14 cases of absolute amenorrhea sexual feeling was absent. Löwenfeld, again (*_Sexualleben und Nervenleiden_*), referring to the common misconception that nervous disorder is associated with increased sexual desire, points out that nervously degenerate women far more often display frigidity than increased sexual desire. Elsewhere (*_Ueber die Sexuelle Konstitution_*) Löwenfeld says it is only among the upper classes that sexual anesthesia is common. Campbell Clark, also, showed some years ago that, in young women with a tendency to chlorosis and a predisposition to insanity, defects of pelvic and mammary development are very prevalent. (*_Journal of Mental Science_*, October, 1888.)

As regards the older medical authors, Schurig (*_Spermatologia_*, 1720, p. 243, and *_Gynæcologia_*, 1730, p. 81) brought together from the literature and from his own knowledge cases of women who felt no pleasure in coitus, as well as of some men who had erections without pleasure.

There is, however, much uncertainty as to what precisely is meant by sexual frigidity or anesthesia. All the old medical authors carefully distinguish between the heat of sexual desire and the actual presence of pleasure in coitus; many modern writers also properly separate *_libido_* from *_voluptas_*, since it is quite possible to experience sexual desires and not to be able to obtain their gratification during sexual intercourse, and it is possible to hold, with Mantegazza, that women naturally have stronger sexual impulses than men, but are more liable than men to experience sexual anesthesia. But it is very much more difficult than most people seem to suppose, to obtain quite precise and definite data concerning the absence of either *_voluptas_* or *_libido_* in a woman. Even if we accept the statement of the woman who asserts that she has either or both, the statement of their absence is by no means equally conclusive and final. As even Adler--who discusses this question fully and has very pronounced opinions about it--admits, there are women who stoutly deny the existence of any sexual feelings until such feelings are actually discovered.[158] Some of the most marked characteristics of the sexual impulse in women, moreover,--its association with modesty, its comparatively late development, its seeming passivity, its need of

stimulation,--all combine to render difficult the final pronouncement that a woman is sexually frigid. Most significant of all in this connection is the complexity of the sexual apparatus in women and the corresponding psychic difficulty--based on the fundamental principle of sexual selection--of finding a fitting mate. The fact that a woman is cold with one man or even with a succession of men by no means shows that she is not apt to experience sexual emotions; it merely shows that these men have not been able to arouse them. "I recall two very striking cases," a distinguished gynecologist, the late Dr. Engelmann, of Boston, wrote to me, "of very attractive young married women--one having had a child, the other a miscarriage--who were both absolutely cold to their husbands, as told me by both husband and wife. They could not understand desire or passion, and would not even believe that it existed. Yet, both these women with other men developed ardent passion, all the stronger perhaps because it had been so long latent." In such cases it is scarcely necessary to invoke Adler's theory of a morbid inhibition, or "foreign body in consciousness," which has to be overcome. We are simply in the presence of the natural fact that the female throughout nature not only requires much loving, but is usually fastidious in the choice of a lover. In the human species this natural fact is often disguised and perverted. Women are not always free to choose the man whom they would prefer as a lover, nor even free to find out whether the man they prefer sexually fits them; they are, moreover, very often extremely ignorant of the whole question of sex, and the victims of the prejudice and false conventions they have been taught. On the one hand, they are driven into an unnatural primness and austerity; on the other hand, they rebound to an equally unnatural facility or even promiscuity. Thus it happens that the men who find that a large number of women are not so facile as they themselves are, and as they have found a large number of women to be, rush to the conclusion that women tend to be "sexually anesthetic." If we wish to be accurate, it is very doubtful whether we can assert that a woman is ever absolutely without the aptitude for sexual satisfaction.[159] She may unquestionably be without any conscious desire for actual coitus. But if we realize to how large an extent woman is a sexual organism, and how diffused and even unconscious the sexual impulses may be, it becomes very difficult to assert that she has never shown any manifestation of the sexual impulse. All we can assert with some degree of positiveness in some cases is that she has not manifested sexual gratification, more particularly as shown by the occurrence of the orgasm, but that is very far indeed from warranting us to assert that she never will experience such gratification or still less that she is organically incapable of experiencing it.[160] It is therefore quite impossible to follow Adler when he asks us to accept the existence

of a condition which he solemnly terms *_anæsthesia sexualis completa idiopathica_*, in which there is no mechanical difficulty in the way or psychic inhibition, but an "absolute" lack of sexual sensibility and a complete absence of sexual inclination.[161]

It is instructive to observe that Adler himself knows no "pure" case of this condition. To find such a case he has to go back nearly two centuries to Madame de Warens, to whom he devotes a whole chapter. He has, moreover, had the courage in writing this chapter to rely entirely on Rousseau's *_Confessions_*, which were written nearly half a century later than the episodes they narrated, and are therefore full of inaccuracies, besides being founded on an imperfect and false knowledge of Madame de Warens's earlier life, and written by a man who was, there can be no doubt, not able to arouse women's passions. Adler shows himself completely ignorant of the historical investigations of De Montet, Mugnier, Ritter, and others which, during recent years, have thrown a flood of light on the life and character of Madame de Warens, and not even acquainted with the highly significant fact that she was hysterical.[162] This is the basis of "fact" on which we are asked to accept *_anæsthesia sexualis completa idiopathica!_*[163]

"In dealing with the alleged absence of the sexual impulse," a well-informed medical correspondent writes from America, "much caution has to be used in accepting statements as to its absence, from the fact that most women fear by the admission to place themselves in an impure category. I am also satisfied that influx of women into universities, etc., is often due to the sexual impulse causing restlessness, and that this factor finds expression in the prurient prudishness so often presenting itself in such women, which interferes with coeducation. This is becoming especially noticeable at the University of Chicago, where prudishness interferes with classical, biological, sociological, and physiological discussion in the classroom. There have been complaints by such women that a given professor has not left out embryological facts not in themselves in any way implying indelicacy. I have even been informed that the opinion is often expressed in college dormitories that embryological facts and discussions should be left out of a course intended for both sexes." Such prudishness, it is scarcely necessary to remark, whether found in women or men, indicates a mind that has become morbidly sensitive to sexual impressions. For the healthy mind embryological and allied facts have no emotionally sexual

significance, and there is, therefore, no need to shun them.

Kolischer, of Chicago ("Sexual Frigidity in Women," American Journal of Obstetrics, Sept., 1905), points out that it is often the failure of the husband to produce sexual excitement in the wife which leads to voluntary repression of sexual sensation on her part, or an acquired sexual anesthesia. "Sexual excitement," he remarks, "not brought to its natural climax, the reaction leaves the woman in a very disagreeable condition, and repeated occurrences of this kind may even lead to general nervous disturbances. Some of these unfortunate women learn to suppress their sexual sensation so as to avoid all these disagreeable sequelæ. Such a state of affairs is not only unfortunate, because it deprives the female partner of her natural rights, but it is also to be deplored because it practically brings down such a married woman to the level of the prostitute."

In illustration of the prevalence of inhibitions of various kinds, from without and from within, in suppressing or disguising sexual feeling in women, I may quote the following observations by an American lady concerning a series of women of her acquaintance:--

"Mrs. A. This woman is handsome and healthy. She has never had children, much to the grief of herself and her husband. The man is also handsome and attractive. Mrs. A. once asked me if love-making between me and my husband ever originated with me. I replied it was as often so as not, and she said that in that event she could not see how passion between husband and wife could be regulated. When I seemed not to be ashamed of the matter, but rather to be positive in my views that it should be so, she at once tried to impress me with the fact that she did not wish me to think she 'could not be aroused.' This woman several times hinted that she had learned a great amount that was not edifying at boarding school, and I always felt that, with proper encouragement, she would have retailed suggestive stories.

"Mrs. B. This woman lives to please her husband, who is a spoiled man. She gave birth to a child soon after marriage, but was left an invalid for some years. She told me coition always hurt her, and she said it made her sick to see her husband nude. I was therefore surprised, years afterward, to hear her say, in reply

to a remark of another person, 'Yes; women are not only as passionate as men, I am sure they are more so.' I therefore questioned the lack of passion she had on former occasions avowed, or else felt convinced her improvement in health had made intercourse pleasant.

"Miss C. A teacher. She is emotional and easily becomes hysterical. Her life has been one of self-sacrifice and her rearing most Puritanical. She told me she thought women did not crave sexual satisfaction unless it had been aroused in them. I consider her one who physically is injured by not having it.

"Mrs. D. After being married a few years this person told me she thought intercourse 'horrid.' Some years after this, however, she fell in love with a man not her husband, which caused their separation. She always fancied men in love with her, and she told me that she and her husband tried to live without intercourse, fearing more children, but they could not do it; she also told of trying to refrain, for the same purpose, until safe parts of the menstrual month, but that 'was just the time she cared least for it.' These remarks made me doubt the sincerity of the first.

"Mrs. E. said she enjoyed intercourse as well as her husband, and she 'didn't see why she should not say so.' This same woman, whether using a current phrase or not, afterward said her husband 'did not bother her very often.'

"Mrs. F., the mother of several children, was married to a man she neither loved nor respected, but she said that when a strange man touched her it made her tremble all over.

"Mrs. G., the mother of many children, divorced on account of the dissipation, drinking and otherwise, of her husband. She is of the creole type, but large and almost repulsive. She is a brilliant talker and she supports herself by writing. She has fallen in love with a number of young men, 'wildly, madly, passionately,' as one of them told me, and I am sure she suffers greatly from the lack of satisfaction. She would no doubt procure it if it were possible.

"I believe," the writer concludes, "women are as passionate as men, but the enforced restraint of years possibly smothers it.

The fear of having children and the methods to prevent conception are, I am sure, potent factors in the injury to the emotions of married women. Perhaps the lack of intercourse acts less disastrously upon a woman because of the renewed feeling which comes after each menstrual period."

As bearing on the causes which have led to the disguise and misinterpretation of the sexual impulse in women I may quote the following communication from another lady:--

"I do think the coldness of women has been greatly exaggerated. Men's theoretically ideal woman (though they don't care so much about it in practice) is passionless, and women are afraid to admit that they have any desire for sexual pleasure. Rousseau, who was not very straight-laced, excuses the conduct of Madame de Warens on the ground that it was not the result of passion: an aggravation rather than a palliation of the offense, if society viewed it from the point of view of any other fault. Even in the modern novels written by the 'new woman' the longing for maternity, always an honorable sentiment, is dragged in to veil the so-called 'lower' desire. That some women, at any rate, have very strong passions and that great suffering is entailed by their repression is not, I am sure, sufficiently recognized, even by women themselves.

"Besides the 'passionless ideal' which checks their sincerity, there are many causes which serve to disguise a woman's feelings to herself and make her seem to herself colder than she really is. Briefly these are:--

"1. Unrecognized disease of the reproductive organs, especially after the birth of children. A friend of mine lamented to me her inability to feel pleasure, though she had done so before the birth of her child, then 3 years old. With considerable difficulty I persuaded her to see a doctor, who told her all the reproductive organs were seriously congested; so that for three years she had lived in ignorance and regret for her husband's sake and her own.

"2. The dread of recommencing, once having suffered them, all the pains and discomforts of child-bearing.

"3. Even when precautions are taken, much bother and anxiety is involved, which has a very dampening effect on excitement.

"4. The fact that men will never take any trouble to find out what specially excites a woman. A woman, as a rule, is at some pains to find out the little things which particularly affect the man she loves,--it may be a trick of speech, a rose in her hair, or what not,--and she makes use of her knowledge. But do you know one man who will take the same trouble? (It is difficult to specify, as what pleases one person may not another. I find that the things that affect me personally are the following: [_a_] Admiration for a man's mental capacity will translate itself sometimes into direct physical excitement. [_b_] Scents of white flowers, like tuberose or syringa. [_c_] The sight of fireflies. [_d_] The idea or the reality of suspension. [_e_] Occasionally absolute passivity.)

"5. The fact that many women satisfy their husbands when themselves disinclined. This is like eating jam when one does not fancy it, and has a similar effect. It is a great mistake, in my opinion, to do so, except very rarely. A man, though perhaps cross at the time, prefers, I believe, to gratify himself a few times, when the woman also enjoys it, to many times when she does not.

"6. The masochistic tendency of women, or their desire for subjection to the man they love. I believe no point in the whole question is more misunderstood than this. Nearly every man imagines that to secure a woman's love and respect he must give her her own way in small things, and compel her obedience in great ones. Every man who desires success with a woman should exactly reverse that theory."

When we are faced by these various and often conflicting statements of opinion it seems necessary to obtain, if possible, a definite basis of objective fact. It would be fairly obvious in any case, and it becomes unquestionable in view of the statements I have brought together, that the best-informed and most sagacious clinical observers, when giving an opinion on a very difficult and elusive subject which they have not studied with any attention and method, are liable to make unguarded assertions; sometimes, also, they become the victims of ethical or pseudoethical prejudices, so as to be most easily influenced by that class

of cases which happens to fit in best with their prepossessions.[164] In order to reach any conclusions on a reasonable basis it is necessary to take a series of unselected individuals and to ascertain carefully the condition of the sexual impulse in each.

At present, however, this is extremely difficult to do at all satisfactorily, and quite impossible, indeed, to do in a manner likely to yield absolutely unimpeachable results. Nevertheless, a few series of observations have been made. Thus, Dr. Harry Campbell[165] records the result of an investigation, carried on in his hospital practice, of 52 married women of the poorer class; they were not patients, but ordinary, healthy working-class women, and the inquiry was not made directly, but of the husbands, who were patients. Sexual instinct was said to be present in 12 cases before marriage, and absent in 40; in 13 of the 40 it never appeared at all; so that it altogether appeared in 39, or in the ratio of something over 75 per cent. Among the 12 in whom it existed before marriage it was said to have appeared in most with puberty; in 3, however, a few years before puberty, and in 2 a few years later. In 2 of those in whom it appeared before puberty, menstruation began late; in the third it rose almost to nymphomania on the day preceding the first menstruation. In nearly all the cases desire was said to be stronger in the husband than in the wife; when it was stronger in the wife, the husband was exceptionally indifferent. Of the 13 in whom desire was absent after marriage, 5 had been married for a period under two years, and Campbell remarks that it would be wrong to conclude that it would never develop in these cases, for in this group of cases the appearance of sexual instinct was sometimes a matter of days, sometimes of years, after the date of marriage. In two-thirds of the cases there was a diminution of desire, usually gradual, at the climacteric; in the remaining third there was either no change or exaltation of desire. The most important general result, Campbell concludes, is that "the sexual instinct is very much less intense in woman than in man," and to this he elsewhere adds a corollary that "the sexual instinct in the civilized woman is, I believe, tending to atrophy."

An eminent gynecologist, the late Dr. Matthews Duncan, has (in his work on Sterility in Women) presented a table which, although foreign to this subject, has a certain bearing on the matter. Matthews Duncan, believing that the absence of sexual desire and of sexual pleasure in coitus are powerful influences working for sterility, noted their presence or absence in a number of cases, and found that, among 191 sterile women between the ages of 15 and 45, 152, or 79 per cent., acknowledged the presence of

sexual desire; and among 196 sterile women (mostly the same cases), 134, or 68 per cent., acknowledged the presence of sexual pleasure in coitus. Omitting the cases over 35 years of age, which were comparatively few, the largest proportion of affirmative answers, both as regards sexual pleasure and sexual desire, was from between 30 and 34 years of age. Matthews Duncan assumes that the absence of sexual desire and sexual pleasure in women is thoroughly abnormal.[166]

An English non-medical author, in the course of a thoughtful discussion of sexual phenomena, revealing considerable knowledge and observation,[167] has devoted a chapter to this subject in another of its aspects. Without attempting to ascertain the normal strength of the sexual instinct in women, he briefly describes 11 cases of "sexual anesthesia" in Women (in 2 or 3 of which there appears, however, to be an element of latent homosexuality) from among the circle of his own friends. This author concludes that sexual coldness is very common among English women, and that it involves questions of great social and ethical importance.

I have not met with any series of observations made among seemingly healthy and normal women in other countries; there are, however, various series of somewhat abnormal cases in which the point was noted, and the results are not uninteresting. Thus, in Vienna at Krafft-Ebing's psychiatric clinic, Gattel (*Ueber die sexuellen Ursachen der Neurasthenie und Angstneurose*, 1898) carefully investigated the cases of 42 women, mostly at the height of sexual life,--i.e., between 20 and 35,--who were suffering from slight nervous disorders, especially neurasthenia and mild hysteria, but none of them from grave nervous or other disease. Of these 42, at least 17 had masturbated, at one time or another, either before or after marriage, in order to obtain relief of sexual feelings. In the case of 4 it is stated that they do not obtain sexual satisfaction in marriage, but in these cases only *coitus interruptus* is practised, and the fact that the absence of sexual satisfaction was complained of seems to indicate an aptitude for experiencing it. These 4 cases can therefore scarcely be regarded as exceptions. In all the other cases sexual desire, sexual excitement, or sexual satisfaction is always clearly indicated, and in a considerable proportion of cases it is noted that the sexual impulse is very strongly developed. This series is valuable, since the facts of the sexual life are, as far as possible, recorded with much precision. The significance of the facts varies, however, according to the view

taken as to the causation of neurasthenia and allied conditions of slight nervous disorder. Gattel argues that sexual irregularities are a peculiarly fruitful, if not invariable, source of such disorders; according to the more commonly accepted view this is not so. If we accept the more usual view, these women fairly correspond to average women of lower class; if, however, we accept Gattel's view, they may possess the sexual instinct in a more marked degree than average women.

In a series of 116 German women in whom the operation of removing the ovaries was performed, Pfister usually noted briefly in what way the sexual impulse was affected by the operation ("Die Wirkung der Castration auf den Weiblichen Organismus," *_Archiv für Gynäkologie_*, 1898, p. 583). In 13 cases (all but 3 unmarried) the presence of sexual desire at any time was denied, and 2 of these expressed disgust of sexual matters. In 12 cases the point is left doubtful. In all the other cases sexual desire had once been present, and in 2 or 3 cases it was acknowledged to be so strong as to approach nymphomania. In about 30 of these (not including any in which it was previously very strong) it was extinguished by castration, in a few others it was diminished, and in the rest unaffected. Thus, when we exclude the 12 cases in which the point was not apparently investigated, and the 10 unmarried women, in whom it may have been latent or unavowed, we find that, of 94 married women, 91 women acknowledged the existence of sexual desire and only 3 denied it.

Schröter, again in Germany, has investigated the manifestations of the sexual impulse among 402 insane women in the asylum at Eichberg in Rheingau. ("Wird bei jungen Unverheiratheten zur Zeit der Menstruation stärkere sexuelle Erregtheit beobachtet?" *_Allgemeine Zeitschrift für Psychiatrie_*, vol. lvi, 1899, pp. 321-333.) There is no reason to suppose that the insane represent a class of the community specially liable to sexual emotion, although its manifestations may become unrestrained and conspicuous under the influence of insanity; and at the same time, while the appearance of such manifestations is evidence of the aptitude for sexual emotions, their absence may be only due to disease, seclusion, or to an intact power of self-control.

Of the 402 women, 166 were married and 236 unmarried. Schröter divided them into four groups: (1) those below 20; (2) those

between 20 and 30; (3) those between 30 and 40; (4) those from 40 to the menopause. The patients included persons from the lowest class of the population, and only about a quarter of them could fairly be regarded as curable. Thus the manifestations of sexuality were diminished, for with advance of mental disease sexual manifestations cease to appear. Schröter only counted those cases in which the sexual manifestations were decided and fairly constant at the menstrual epoch; if not visibly manifested, sexual feeling was not taken into account. Sexual phenomena accompanied the entry of the menstrual epoch in 141 cases: i.e., in 20 (or in the proportion of 72 per cent.) of the first group, consisting entirely of unmarried women; in 33 (or 28 per cent.) of the second group; in 55 (or 35 per cent.) of the third group; and in 33 (or 33 per cent.) of the fourth group. It was found that 181 patients showed no sexual phenomena at any time, while 80 showed sexual phenomena frequently between the menstrual epochs, but only in a slight degree, and not at all during the period. At all ages sexual manifestations were more prevalent among the unmarried than among the married, though this difference became regularly and progressively less with increase in age.

Schröter inclines to think that sexual excitement is commoner among insane women belonging to the lower social classes than in those belonging to the better classes. Among 184 women in a private asylum, only 13 (6.13 per cent.) showed very marked and constant excitement at menstrual periods. He points out, however, that this may be due to a greater ability to restrain the manifestations of feeling.

There is some interest in Schröter's results, though they cannot be put on a line with inquiries made among the sane; they only represent the prevalence of the grossest and strongest sexual manifestations when freed from the restraints of sanity.

As a slight contribution toward the question, I have selected a series of 12 cases of women of whose sexual development I possess precise information, with the following results: In 2 cases distinct sexual feeling was experienced spontaneously at the age of 7 and 8, but the complete orgasm only occurred some years after puberty; in 5 cases sexual feeling appeared spontaneously for a few months to a year after the appearance of menstruation, which began between 12 and 14 years of age,

usually at 13; in another case sexual feeling first appeared shortly after menstruation began, but not spontaneously, being called out by a lover's advances; in the remaining 4 cases sexual emotion never became definite and conscious until adult life (the ages being 26, 27, 34, 35), in 2 cases through being made love to, and in 2 cases through self-manipulation out of accident or curiosity. It is noteworthy that the sexual feelings first developed in adult life were usually as strong as those arising at puberty. It may be added that, of these 12 women, 9 had at some time or another masturbated (4 shortly after puberty, 5 in adult life), but, except in 1 case, rarely and at intervals. All belong to the middle class, 2 or 3 leading easy, though not idle, lives, while all the others are engaged in professional or other avocations often involving severe labor. They differ widely in character and mental ability; but, while 2 or 3 might be regarded as slightly abnormal, they are all fairly healthy.

I am inclined to believe that the experiences of the foregoing group are fairly typical of the social class to which they belong. I may, however, bring forward another series of 35 women, varying in age from 18 to 40 (with 2 exceptions all over 25), and in every respect comparable with the smaller group, but concerning whom my knowledge, though reliable, is usually less precise and detailed. In this group 5 state that they have never experienced sexual emotion, these being all unmarried and leading strictly chaste lives; in 18 cases the sexual impulse may be described as strong, or is so considered by the subject herself; in 9 cases it is only moderate; in 3 it is very slight when evoked, and with difficulty evoked, in 1 of these only appearing two years after marriage, in another the exhaustion and worry of household cares being assigned for its comparative absence. It is noteworthy that all the more highly intelligent, energetic women in the series appear in the group of those with strong sexual emotions, and also that severe mental and physical labor, even when cultivated for this purpose, has usually had little or no influence in relieving sexual emotion.

An American physician in the State of Connecticut sends me the following notes concerning a series of 13 married women, taken, as they occurred, in obstetric practice. They are in every way respectable and moral women:--

"Mrs. A. says that her husband does not give her sufficient sexual attention, as he fears they will have more children than he can properly care for. Mrs. B. always enjoys intercourse; so does Mrs. C. Mrs. D. is easily excited and very fond of sexual

attention. Mrs. E. likes intercourse if her husband is careful not to hurt her. Mrs. F. never had any sexual desire until after second marriage, but it is now very urgent at times. Mrs. G. is not easily excited, but has never objected to her husband's attention. Mrs. H. would prefer to have her husband exhibit more attention. Mrs. I. never refused her husband, but he does not trouble her much. Mrs. J. thinks that three or four times a week is satisfactory, but would not object to nightly intercourse. Mrs. K. does not think that her husband could give her more than she would like. Mrs. L. would prefer to live with a woman if it were not for sexual intercourse. Mrs. M., aged 40, says that her husband, aged 65, insists upon intercourse three times every night, and that he keeps her tired and disgusted. She each time has at least one orgasm, and would not object to reasonable attention."

It may be remarked that, while these results in English women of the middle class are in fair agreement with the German and Austrian observations I have quoted, they differ from Campbell's results among women of the working class in London. This discrepancy is, perhaps, not difficult to explain. While the conditions of upper-class life may possibly be peculiarly favorable to the development of the sexual emotions, among the working classes in London, where the stress of the struggle for existence under bad hygienic conditions is so severe, they may be peculiarly unfavorable. It is thus possible that there really are a smaller number of women experiencing sexual emotion among the class dealt with by Campbell than among the class to which my series belong.[168]

A more serious consideration is the method of investigation. A working man, who is perhaps unintelligent outside his own work, and in many cases married to a woman who is superior in refinement, may possibly be able to arouse his wife's sexual emotions, and also able to ascertain what those emotions are, and be willing to answer questions truthfully on this point, to the best of his ability, but he is by no means a witness whose evidence is final. While, however, Campbell's facts may not be quite unquestionable, I am inclined to agree with his conclusion, and Mantegazza's, that there is a very great range of variation in this matter, and that there is no age at which the sexual impulse in women may not appear. A lady who has received the confidence of very many women tells me that she has never found a woman who was without sexual feeling. I should myself be inclined to say that it is extremely difficult to find a woman who is without the aptitude for sexual emotion, although a great

variety of circumstances may hinder, temporarily or permanently, the development of this latent aptitude. In other words, while the latent sexual aptitude may always be present, the sexual impulse is liable to be defective and the aptitude to remain latent, with consequent deficiency of sexual emotion, and absence of sexual satisfaction.

This is not only indicated by the considerable proportion of my cases in which there is only moderate or slight sexual feeling. I have ample evidence that in many cases the element of pain, which may almost be said to be normal in the establishment of the sexual function, is never merged, as it normally is, in pleasurable sensations on the full establishment of sexual relationships. Sometimes, no doubt, this may be due to dyspareunia. Sometimes there may be an absolute sexual anesthesia, whether of congenital or hysterical origin. I have been told of the case of a married lady who has never been able to obtain sexual pleasure, although she has had relations with several men, partly to try if she could obtain the experience, and partly to please them; the very fact that the motives for sexual relationships arose from no stronger impulse itself indicates a congenital defect on the psychic as well as on the physical side. But, as a rule, the sexual anesthesia involved is not absolute, but lies in a disinclination to the sexual act due to various causes, in a defect of strong sexual impulse, and an inaptitude for the sexual orgasm.

I am indebted to a lady who has written largely on the woman question, and is herself the mother of a numerous family, for several letters in regard to the prevalence among women of sexual coldness, a condition which she regards as by no means to be regretted. She considers that in all her own children the sexual impulse is very slightly developed, the boys being indifferent to women, the girls cold toward men and with no desire to marry, though all are intelligent and affectionate, the girls showing a very delicate and refined kind of beauty. (A large selection of photographs accompanied this communication.) Something of the same tendency is said to mark the stocks from which this family springs, and they are said to be notable for their longevity, healthiness, and disinclination for excesses of all kinds. It is scarcely necessary to remark that a mother, however highly intelligent, is by no means an infallible judge as to the presence or absence in her children of so shy, subtle, and

elusive an impulse as that of sex. At the same time I am by no means disposed to question the existence in individuals, and even in families or stocks, of a relatively weak sexual impulse, which, while still enabling procreation to take place, is accompanied by no strong attraction to the opposite sex and no marked inclination for marriage. (Adler, op. cit., p. 168, found such a condition transmitted from mother to daughter.) Such persons often possess a delicate type of beauty. Even, however, when the health is good there seems usually to be a certain lack of vitality.

It seems to me that a state of sexual anesthesia, relative or absolute, cannot be considered as anything but abnormal. To take even the lowest ground, the satisfaction of the reproductive function ought to be at least as gratifying as the evacuation of the bowels or bladder; while, if we take, as we certainly must, higher ground than this, an act which is at once the supreme fact and symbol of love and the supreme creative act cannot under normal conditions be other than the most pleasurable of all acts, or it would stand in violent opposition to all that we find in nature.

How natural the sexual impulse is in women, whatever difficulties may arise in regard to its complete gratification, is clearly seen when we come to consider the frequency with which in young women we witness its more or less instinctive manifestations. Such manifestations are liable to occur in a specially marked manner in the years immediately following the establishment of puberty, and are the more impressive when we remember the comparatively passive part played by the female generally in the game of courtship, and the immense social force working on women to compel them to even an unnatural extension of that passive part. The manifestations to which I allude not only occur with most frequency in young girls, but, contrary to the common belief, they seem to occur chiefly in innocent and unperverted girls. The more vicious are skillful enough to avoid the necessity for any such open manifestations. We have to bear this in mind when confronted by flagrant sexual phenomena in young girls.

"A young girl," says Hammer ("Ueber die Sinnlichkeit gesunder Jungfrauen," *Die Neue Generation*, Aug., 1911), "who has not previously adopted any method of self-gratification experiences at the beginning of puberty, about the time of the first menstruation and the sprouting of the pubic hair, in the absence of all stimulation by a man, spontaneous sexual tendencies of

both local and psychic nature. On the psychic side there is a feeling of emptiness and dissatisfaction, a need of subjection and of serving, and, if the opportunity has so far been absent, the craving to see masculine nudity and to learn the facts of procreation. Side by side with these wishes, there are at the same time inhibitory desires, such as the wish to keep herself pure, either for a man whom she represents to herself as the 'ideal,' or for her parents, who must not be worried, or as a member of a chosen people in whose spirit she must live and die, or out of love to Jesus or to some saint. On the physical side, there is the feeling of fresh power and energy, of enterprise; the agreeable tension of the genital regions, which easily become moist. Then there is the feeling of overirritability and excess of tension, and the need of relieving the tension through pinches, blows, tight lacing, and so forth. If the girl remains innocent of sex satisfaction, there takes place during sleep, at regular intervals of about three days, more or less the relief and emission of the tense glands, not corresponding to the menstrual period, but to intercourse, and serving better than sexual instruction to represent to her the phenomena of intercourse. If at this period actual intercourse takes place, it is, as a rule, free from pain, as also is the introduction of the speculum. Without any seduction from without, the chaste girl now frequently finds a way to relieve the excessive tension without the aid of a man. It is self-abuse that leads gradually to the production of pain in defloration. The menstrual phenomena correspond to birth; self-gratification or relief during sleep to intercourse." This statement of the matter is somewhat too absolute and unqualified. Under the artificial conditions of civilization the inhibitory influences of training speedily work powerfully, and more or less successfully, in banishing sexual phenomena into the subconscious, sometimes to work all the mischief there which Freud attributes to them. It must also be said (as I have pointed out in the discussion of Auto-erotism in another volume) that sexual dreams seem to be the exception rather than the rule in innocent girls. It remains true that sexual phenomena in girls at puberty must not be regarded as morbid or unnatural. There is also very good reason for believing (even apart from the testimony of so experienced a gynecologist as Hammer) that on the physical side sexual processes tend to be accomplished with a facility that is often lost in later years with prolonged chastity. This is true alike of intercourse and of

childbirth. (See vol. vi of these Studies, ch. xii.)

Even, however, in the case of adults the active part played by women in real life in matters of love by no means corresponds to the conventional ideas on these subjects. No doubt nearly every woman receives her sexual initiation from an older and more experienced man. But, on the other hand, nearly every man receives his first initiation through the active and designed steps taken by an older and more experienced woman. It is too often forgotten by those who write on these subjects that the man who seduces a woman has usually himself in the first place been "seduced" by a woman.

A well-known physician in Chicago tells me that on making inquiry of 25 middle-class married men in succession he found that 16 had been first seduced by a woman. An officer in the Indian Medical Service writes to me as follows: "Once at a club in Burma we were some 25 at table and the subject of first intercourse came up. All had been led astray by servants save 2, whom their sisters' governesses had initiated. We were all men in the 'service,' so the facts may be taken to be typical of what occurs in our stratum of society. All had had sexual relations with respectable unmarried girls, and most with the wives of men known to their fathers, in some instances these being old enough to be their lovers' mothers. Apparently up to the age of 17 none had dared to make the first advances, yet from the age of 13 onward all had had ample opportunity for gratifying their sexual instincts with women. Though all had been to public schools where homosexuality was known to occur, yet (as I can assert from intimate knowledge) none had given signs of inversion or perversion in Burma."

In Russia, Tchlenoff, investigating the sexual life of over 2000 Moscow students of upper and middle class (Archives d'Anthropologie Criminelle, Oct.-Nov., 1908), found that in half of them the first coitus took place between 14 and 17 years of age; in 41 per cent, with prostitutes, in 39 per cent, with servants, and in 10 per cent, with married women. In 41 per cent, the young man declared that he had taken the initiative, in 25 per cent, the women took it, and in 23 per cent, the incitement came from a comrade.

The histories I have recorded in Appendix B (as well as in the two following volumes of these Studies) very well illustrate

the tendency of young girls to manifest sexual impulses when freed from the constraint which they feel in the presence of adult men and from the fear of consequences. These histories show especially how very frequently nurse-maids and servant-girls effect the sexual initiation of the young boys intrusted to them. How common this impulse is among adolescent girls of low social class is indicated by the fact that certainly the majority of middle-class men can recall instances from their own childhood. (I here leave out of account the widespread practice among nurses of soothing very young children in their charge by manipulating the sexual organs.)

A medical correspondent, in emphasizing this point, writes that "many boys will tell you that, if a nurse-girl is allowed to sleep in the same room with them, she will attempt sexual manipulations. Either the girl gets into bed with the boy and pulling him on to her tickles the penis and inserts it into the vulva, making the boy imitate sexual movements, or she simply masturbates the child, to get him excited and interested, often showing him the female sexual opening in herself or in his sisters, teaching him to finger it. In fact, a nurse-girl may ruin a boy, chiefly, I think, because she has been brought up to regard the sexual organs as a mystery, and is in utter ignorance about them. She thus takes the opportunity of investigating the boy's penis to find out how it works, etc., in order to satisfy her curiosity. I know of a case in which a nurse in a fashionable London Square garden used to collect all the boys and girls (gentlemen's children) in a summer-house when it grew dark, and, turning up her petticoats, invite all the boys to look at and feel her vulva, and also incite the older boys of 12 or 14 to have coitus with her. Girls are afraid of pregnancy, so do not allow an adult penis to operate. I think people should take on a far higher class of nurses, than they do."

"Children ought never to be allowed, under any circumstances whatever," wrote Lawson Tait (*Diseases of Women*, 1889, p. 62), "to sleep with servants. In every instance where I have found a number of children affected [by masturbation] the contagion has been traced to a servant." Freud has found (*Neurologisches Centralblatt*, No. 10, 1896) that in cases of severe youthful hysteria the starting point may frequently be traced to sexual manipulations by servants, nurse-girls, and governesses.

"When I was about 8 or 9," a friend writes, "a servant-maid of our family, who used to carry the candle out of my bedroom, often drew down the bedclothes and inspected my organs. One night she put the penis in her mouth. When I asked her why she did it her answer was that 'sucking a boy's little dangle' cured her of pains in her stomach. She said that she had done it to other little boys, and declared that she liked doing it. This girl was about 16; she had lately been 'converted.' Another maid in our family used to kiss me warmly on the naked abdomen when I was a small boy. But she never did more than that. I have heard of various instances of servant-girls tampering with boys before puberty, exciting the penis to premature erection by manipulation, suction, and contact with their own parts." Such overstimulation must necessarily in some cases have an injurious influence on the boy's immature nervous system. Thus, Hutchinson (*_Archives of Surgery_*, vol. iv, p. 200) describes a case of amblyopia in a boy, developing after he had been placed to sleep in a servant-girl's room.

Moll (*_Konträre Sexualempfindung_*, third edition, 1899, p. 325) refers to the frequency with which servant-girls (between the ages of 18 and 30) carry on sexual practices with young boys (between 5 and 13) committed to their care. More than a century earlier Tissot, in his famous work on onanism, referred to the frequency with which servant-girls corrupt boys by teaching them to masturbate; and still earlier, in England, the author of *_Onania_* gave many such cases. We may, indeed, go back to the time of Rabelais, who (as Dr. Kiernan reminds me) represents the governesses of Gargantua, when he was a child, as taking pleasure in playing with his penis till it became wet, and joking with each other about it. (*_Gargantua_*, book i, chapter ix.)

The prevalence of such manifestations among servant-girls witnesses to their prevalence among lower-class girls generally. In judging such acts, even when they seem to be very deliberate, it is important to remember that at this age unreasoning instinct plays a very large part in the manifestations of the sexual impulse. This is clearly indicated by the phenomena observed in the insane. Thus, as we have seen (page 214), Schröter has found that, among girls of low social class under 20 years of age, spontaneous periodical sexual manifestations at menstrual epochs

occurred in as large a proportion as 72 per cent. Among girls of better social position these impulses are inhibited, or at all events modified, by good taste or good feeling, the influences of tradition or education; it is only to the latter that children should be intrusted.

Hoche mentions a case in which a man was accused of repeatedly exhibiting his sexual organs to the servant-girl at a house; she enjoyed the spectacle (*Neurologisches Centralblatt*, 1896, No. 2). It may well be that in some cases of self-exhibition the offender has good reason, on the ground of previous experience, for thinking that he is giving pleasure. "When we used to go to bathe while I was at school," writes a correspondent, "girls from a poor quarter of the lower town (some quite 16) often followed us and stood to watch about a hundred yards from the river. They used to 'giggle' and 'pass remarks.' I have seen girls of this class peeping through chinks of a palisade around a bathing-place on the Thames." A correspondent who has given special attention to the point tells me of the great interest displayed by young girls of the people in Italy in the sexual organs of men.

Curiosity--whether in the form of the desire for knowledge or the desire for sensation--is, of course, not confined to young girls and women of lower social strata, though in them it is less often restrained by motives of self-respect and good feeling. "At the age of 8," writes a correspondent, "I was one day playing in a spare room with a girl of about 12 or 13. She gave me a penholder, and, crouching upon her hands and knees, with her posterior toward me, invited me to introduce the instrument into the vulva. This was the first time I had seen the female parts, and, as I appeared to be somewhat repelled, she coaxed me to comply with her desire. I did as she directed, and she said that it gave her pleasure. Several times after I repeated the same act at her request. A friend tells me that when he was 10 a girl of 16 asked him to lace up her boots. While he was kneeling at her feet his hand touched her ankle. She asked him to put his hand higher, and repeated 'Higher, higher,' till he touched the pudenda, and finally, at her request, put his finger into the vestibule. This girl was very handsome and amiable, and a favorite of the boy's mother. No one suspected this propensity." Again, a correspondent (a man of science) tells me of a friend who lately, when dining out, met a girl, the daughter of a

country vicar; he was not specially attracted to her and paid her no special attention. "A few days afterward he was astonished to receive a call from her one afternoon (though his address is not discoverable from any recognized source). She sat down as near to him as she could, and rested her hand on his thigh, etc., while talking on different subjects and drinking tea. Then without any verbal prelude she asked him to have connection with her. Though not exactly a Puritan, he is not the man to jump at such an offer from a woman he is not in love with, so, after ascertaining that the girl was virgo intacta, he declined and she went away. A fortnight or so later he received a letter from her in the country, making no reference to what had passed, but giving an account of her work with her Sunday-school class. He did not reply, and then came a curt note asking him to return her letter. My friend feels sure she was devoted to auto-erotic performances, but, having become attracted to him, came to the conclusion she would like to try normal intercourse."

Wolbarst, studying the prevalence of gonorrhea among boys in New York (especially, it would appear, in quarters where the foreign-born elements--mainly Russian Jew and south Italian--are large), states: "In my study of this subject there have been observed 3 cases of gonorrheal urethritis, in boys aged, respectively, 4, 10, and 12 years, which were acquired in the usual manner, from girls ranging between 10 and 12 years of age. In each case, according to the story told by the victim, the girl made the first advances, and in 1 case, that of the 4-year-old boy, the act was consummated in the form of an assault, by a girl 12 years old, in which the child was threatened with injury unless he performed his part." (A.L. Wolbarst, Journal of the American Medical Association, Sept. 28, 1901.) In a further series of cases (Medical Record, Oct. 29, 1910) Wolbarst obtained similar results, though he recognizes also the frequency of precocious sexuality in the young boys themselves.

Gibb states, concerning assaults on children by women: "It is undeniably true that they occur much more frequently than is generally supposed, although but few of the cases are brought to public notice, owing to the difficulty of proving the charge." (W.T. Gibb, article "Indecent Assaults upon Children," in A. McLane Hamilton's System of Legal Medicine, vol. i, p. 651.) Gibb's opinion carries weight, since he is medical adviser for

the New York Society for the Protection of Children, and compelled to sift the evidence carefully in such cases.

It should be mentioned that, while a sexual curiosity exercised on younger children is, in girls about the age of puberty, an ill-regulated, but scarcely morbid, manifestation, in older women it may be of pathological origin. Thus, Kisch records the case of a refined and educated lady of 30 who had been married for nine years, but had never experienced sexual pleasure in coitus. For a long time past, however, she had felt a strong desire to play with the genital organs of children of either sex, a proceeding which gave her sexual pleasure. She sought to resist this impulse as much as possible, but during menstruation it was often irresistible. Examination showed an enlarged and retroflexed uterus and anesthesia of vagina. (Kisch, *Die Sterilität des Weibes*, 1886, p. 103.) The psychological mechanism by which an anesthetic vagina leads to a feeling of repulsion for normal coitus and normal sexual organs, and directs the sexual feelings toward more infantile forms of sexuality, is here not difficult to trace.

It is not often that the sexual attempts of girls and young women on boys--notwithstanding their undoubted frequency--become of medico-legal interest. In France in the course of ten years (1874 to 1884) only 181 women, who were mostly between 20 and 30 years of age, were actually convicted of sexual attempts on children below 15. (Paul Bernard, "Viols et attentats a la Pudeur," *Archives de l'Anthropologie Criminelle*, 1887.) Lop ("Attentats à la Pudeur commis par des Femmes sur des Petits Enfants," *id.*, Aug., 1896) brings together a number of cases chiefly committed by girls between the ages of 18 and 20. In England such accusations against a young woman or girl may easily be circumvented. If she is under 16 she is protected by the Criminal Law Amendment Act and cannot be punished. In any case, when found out, she can always easily bring the sympathy to her side by declaring that she is not the aggressor, but the victim. Cases of violent sexual assault upon girls, Lawson Tait remarks, while they undoubtedly do occur, are very much rarer than the frequency with which the charge is made would lead us to suspect. At one time, by arrangement with the authority, 70 such charges at Birmingham were consecutively brought before Lawson Tait. These charges were all made under the Criminal Law Amendment Act. In

only 6 of these cases was he able to advise prosecution, in all of which cases conviction was obtained. In 7 other cases in which the police decided to prosecute there was either no conviction or a very light sentence. In at least 26 cases the charge was clearly trumped up. The average age of these girls was 12. "There is not a piece of sexual argot that ever had before reached my ears," remarks Mr. Tait, "but was used by these children in the descriptions given by them of what had been done to them; and they introduced, in addition, quite a new vocabulary on the subject. The minute and detailed descriptions of the sexual act given by chits of 10 and 11 would do credit to the pages of Mirabeau. At first sight it is a puzzle to see how children so young obtained their information." "About the use of the word 'seduced,'" the same writer remarks, "I wish to say that the class of women from amongst whom the great bulk of these cases are drawn seem to use it in a sense altogether different from that generally employed. It is not with them a process in which male villainy succeeds by various arts in overcoming female virtue and reluctance, but simply a date at which an incident in their lives occurs for the first time; and, according to their use of the phrase, the ancient legend of the Sacred Scriptures, had it ended in the more ordinary and usual way by the virtue of Joseph yielding to the temptation offered, would have to read as a record of the seduction of Mrs. Potiphar."

With reference to Lawson Tait's observation that violent assaults on women, while they do occur, are very much rarer than the frequency with which such charges are made would lead us to believe, it may be remarked that many medico-legal authorities are of the same opinion. (See, e.g., G. Vivian Poore's Treatise on Medical Jurisprudence, 1901, p. 325. This writer also remarks: "I hold very strongly that a woman may rape a man as much as a man may rape a woman.") There can be little doubt that the plea of force is very frequently seized on by women as the easiest available weapon of defense when her connection with a man has been revealed. She has been so permeated by the current notion that no "respectable" woman can possibly have any sexual impulses of her own to gratify that, in order to screen what she feels to be regarded as an utterly shameful and wicked, as well as foolish, act, she declares it never took place by her own will at all. "Now, I ask you, gentlemen," I once heard an experienced counsel address the jury in a criminal case, "as men of the

world, have you ever known or heard of a woman, a single woman, confess that she had had sexual connection and not declare that force had been used to compel her to such connection?" The statement is a little sweeping, but in this matter there is some element of truth in the "man of the world's" opinion. One may refer to the story (told by Etienne de Bourbon, by Francisco de Osuna in a religious work, and by Cervantes in *_Don Quixote_*, part ii, ch. xlv) concerning a magistrate who, when a girl came before him to complain of rape, ordered the accused young man either to marry her or pay her a sum of money. The fine was paid, and the magistrate then told the man to follow the girl and take the money from her by force; the man obeyed, but the girl defended herself so energetically that he could not secure the money. Then the judge, calling the parties before him again, ordered the fine to be returned: "Had you defended your chastity as well as you have defended your money it could not have been taken away from you." In most cases of "rape," in the case of adults, there has probably been some degree of consent, though that partial assent may have been basely secured by an appeal to the lower nervous centers alone, with no participation of the intelligence and will. Freud (*_Zur Psychopathologie des Alltagslebens_*, p. 87) considers that on this ground the judge's decision in *_Don Quixote_* is "psychologically unjust," because in such a case the woman's strength is paralyzed by the fact that an unconscious instinct in herself takes her assailant's part against her own conscious resistance. But it must be remembered that the factor of instinct plays a large part even when no violence is attempted.

Such facts and considerations as these tend to show that the sexual impulse is by no means so weak in women as many would lead us to think. It would appear that, whereas in earlier ages there was generally a tendency to credit women with an unduly large share of the sexual impulse, there is now a tendency to unduly minimize the sexual impulse in women.

FOOTNOTES:

[156] I have had occasion to refer to the historic evolution of male opinion regarding women in previous volumes, as, e.g., *_Man and Woman_*, chapter i, and the appendix on "The Influence of Menstruation on the Position of Women" in the first volume of these *_Studies_*.

[157] The terminology proposed by Ziehen ("Zur Lehre von den psychopathischen Konstitutionen," *Charité Annalen*, vol. xxxxi, 1909) is as follows: For absence of sexual feeling, *anhedonia*; for diminution of the same, *hyphedonia*; for excess of sexual feeling, *hyperhedonia*; for qualitative sexual perversions, *parhedonia*. "Erotic blindness" was suggested by Nardelli.

[158] O. Adler, *Die Mangelhafte Geschlechtsempfindung des Weibes*, 1904, p. 146.

[159] A correspondent tells me that he knows a woman who has been a prostitute since the age of 15, but never experienced sexual pleasure and a real, non-simulated orgasm till she was 23; since then she has become very sensual. In other similar cases the hitherto indifferent prostitute, having found the man who suits her, abandons her profession, even though she is thereby compelled to live in extreme poverty. "An insensible woman," as La Bruyère long ago remarked in his chapter "Des Femmes," "is merely one who has not yet seen the man she must love."

[160] Guttzeit (*Dreissig Jahre Praxis*, vol. i, p. 416) pointed out that the presence or absence of the orgasm is the only factor in "sexual anesthesia" of which we can speak at all definitely; and he believed that anaphrodisia, in the sense of absence of the sexual impulse, never occurs at all, many women having confided to him that they had sexual desires, although those desires were not gratified by coitus.

[161] *Op. cit.*, p. 164.

[162] Havelock Ellis, "Madame de Warens," *The Venture*, 1903.

[163] It is interesting to observe that finally even Adler admits (*op. cit.*, p. 155) that there is no such thing as *congenital* lack of aptitude for sexual sensibility.

[164] "I am not entirely satisfied with the testimony as to the alleged sexual anesthesia," a medical correspondent writes. "The same principle which makes the young harlot an old saint makes the repentant rake a believer in sexual anesthesia. Most of the medical men who believe, or claim to believe, that sexual anesthesia is so prevalent do so either to flatter their hysterical patients or because they have the mentality of the Hyacinthe of Zola's *Paris*."

[165] _Differences in the Nervous Organization of Man and Woman_, 1891; chapter xiii, "Sexual Instinct in Men and Women Compared."

[166] Matthews Duncan considered that "the healthy performance of the functions of child-bearing is surely connected with a well-regulated condition of desire and pleasure." "Desire and pleasure," he adds, "may be excessive, furious, overpowering, without bringing the female into the class of maniacs; they may be temporary, healthy, and moderate; they may be absent or dull." (Matthews Duncan, _Goulstonian Lectures on Sterility in Woman_, pp. 91, 121.)

[167] Geoffrey Mortimer, _Chapters on Human Love_, 1898, ch. xvi.

[168] I do not, however, attach much weight to this possibility. The sexual instinct among the lower social classes everywhere is subject to comparatively weak inhibition, and Löwenfeld is probably right in believing the women of the lower class do not suffer from sexual anesthesia to anything like the same extent as upper-class women. In England most women of the working class appear to have had sexual intercourse at some time in their lives, notwithstanding the risks of pregnancy, and if pregnancy occurs they refer to it calmly as an "accident," for which they cannot be held responsible; "Well, I couldn't help that," I have heard a young widow remark when mildly reproached for the existence of her illegitimate child. Again, among American negresses there seems to be no defect of sexual passion, and it is said that the majority of negresses in the Southern States support not only their children, but their lovers and husbands.

II.

Special Characters of the Sexual Impulse in Women--The More Passive Part Played by Women in Courtship--This Passivity only Apparent--The Physical Mechanism of the Sexual Process in Women More Complex--The Slower Development of Orgasm in Women--The Sexual Impulse in Women More Frequently Needs to be Actively Aroused--The Climax of Sexual Energy Falls Later in Women's Lives than in Men's--Sexual Ardor in Women Increased After the Establishment of Sexual Relationships--Women bear Sexual Excesses better than Men--The Sexual Sphere Larger and More Diffused in

Women--The Sexual Impulse in Women Shows a Greater Tendency to Periodicity and a Wider Range of Variation.

So far I have been discussing the question of the sexual impulse in women on the ground upon which previous writers have usually placed it. The question, that is, has usually presented itself to them as one concerning the relative strength of the impulse in men and women. When so considered, not hastily and with prepossession, as is too often the case, but with a genuine desire to get at the real facts in all their aspects, there is no reason, as we have seen, to conclude that, on the whole, the sexual impulse in women is lacking in strength.

But we have to push our investigation of the matter further. In reality, the question as to whether the sexual impulse is or is not stronger in one sex than in the other is a somewhat crude one. To put the question in that form is to reveal ignorance of the real facts of the matter. And in that form, moreover, no really definite and satisfactory answer can be given.

It is necessary to put the matter on different ground. Instead of taking more or less insolvable questions as to the strength of the sexual impulse in the two sexes, it is more profitable to consider its differences. What are the special characters of the sexual impulse in women?

There is certainly one purely natural sexual difference of a fundamental character, which lies at the basis of whatever truth may be in the assertion that women are not susceptible of sexual emotion. As may be seen when considering the phenomena of modesty, the part played by the female in courtship throughout nature is usually different from that played by the male, and is, in some respects, a more difficult and complex part. Except when the male fails to play his part properly, she is usually comparatively passive; in the proper playing of her part she has to appear to shun the male, to flee from his approaches--even actually to repel them.[169]

Courtship resembles very closely, indeed, a drama or game; and the aggressiveness of the male, the coyness of the female, are alike unconsciously assumed in order to bring about in the most effectual manner the ultimate union of the sexes. The seeming reluctance of the female is not intended to inhibit sexual activity either in the male or in herself, but to increase it in both. The passivity of the female, therefore, is not a real, but only an apparent, passivity, and this holds true of our own

species as much as of the lower animals. "Women are like delicately adjusted alembics," said a seventeenth-century author. "No fire can be seen outside, but if you look underneath the alembic, if you place your hand on the hearts of women, in both places you will find a great furnace." [170] Or, as Marro has finely put it, the passivity of women in love is the passivity of the magnet, which in its apparent immobility is drawing the iron toward it. An intense energy lies behind such passivity, an absorbed preoccupation in the end to be attained.

Tarde, when exercising magistrate's functions, once had to inquire into a case in which a young man was accused of murder. In questioning a girl of 18, a shepherdess, who appeared before him as a witness, she told him that on the morning following the crime she had seen the footmarks of the accused up to a certain point. He asked how she recognized them, and she replied, ingenuously but with assurance, that she could recognize the footprints of every young man in the neighborhood, even in a plowed field. [171] No better illustration could be given of the real significance of the sexual passivity of women, even at its most negative point.

"The women I have known," a correspondent writes, "do not express their sensations and feelings as much as I do. Nor have I found women usually anxious to practise 'luxuries.' They seldom care to practice _fellatio_; I have only known one woman who offered to do _fellatio_ because she liked it. Nor do they generally care to masturbate a man; that is, they do not care greatly to enjoy the contemplation of the other person's excitement. (To me, to see the woman excited means almost more than my own pleasure.) They usually resist _cunnilinctus_, although they enjoy it. They do not seem to care to touch or look at a man's parts so much as he does at theirs. And they seem to dislike the tongue-kiss unless they feel very sexual or really love a man." My correspondent admits that his relationships have been numerous and facile, while his erotic demands tend also to deviate from the normal path. Under such circumstances, which not uncommonly occur, the woman's passions fail to be deeply stirred, and she retains her normal attitude of relative passivity.

It is owing to the fact that the sexual passivity of women is only an apparent, and not a real, passivity that women are apt to suffer, as men are, from prolonged sexual abstinence. This, indeed, has been denied, but can scarcely be said to admit of doubt. The only question is as to the relative amount of such

suffering, necessarily a very difficult question. As far back as the fourteenth century Johannes de Sancto Amando stated that women are more injured than men by sexual abstinence. In modern times Maudsley considers that women "suffer more than men do from the entire deprivation of sexual intercourse" ("Relations between Body and Mind," Lancet, May 28, 1870). By some it has been held that this cause may produce actual disease. Thus, Tilt, an eminent gynecologist of the middle of the nineteenth century, in discussing this question, wrote: "When we consider how much of the lifetime of woman is occupied by the various phases of the generative process, and how terrible is often the conflict within her between the impulse of passion and the dictates of duty, it may be well understood how such a conflict reacts on the organs of the sexual economy in the unimpregnated female, and principally on the ovaria, causing an orgasm, which, if often repeated, may possibly be productive of subacute ovaritis." (Tilt, On Uterine and Ovarian Inflammation, 1862, pp. 309-310.) Long before Tilt, Haller, it seems, had said that women are especially liable to suffer from privation of sexual intercourse to which they have been accustomed, and referred to chlorosis, hysteria, nymphomania, and simple mania curable by intercourse. Hegar considers that in women an injurious result follows the nonsatisfaction of the sexual impulse and of the "ideal feelings," and that symptoms thus arise (pallor, loss of flesh, cardialgia, malaise, sleeplessness, disturbances of menstruation) which are diagnosed as "chlorosis." (Hegar, Zusammenhang der Geschlechtskrankheiten mit nervösen Leiden, 1885, p. 45.) Freud, as well as Gattel, has found that states of anxiety (Angstzustände) are caused by sexual abstinence. Löwenfeld, on careful examination of his own cases, is able to confirm this connection in both sexes. He has specially noticed it in young women who marry elderly husbands. Löwenfeld believes, however, that, on the whole, healthy unmarried women bear sexual abstinence better than men. If, however, they are of at all neuropathic disposition, ungratified sexual emotions may easily lead to various morbid conditions, especially of a hysteroneurasthenic character. (Löwenfeld, Sexualleben und Nervenleiden, second edition, 1899, pp. 44, 47, 54-60.) Balls-Headley considers that unsatisfied sexual desires in women may lead to the following conditions: general atrophy, anemia, neuralgia and hysteria, irregular menstruation, leucorrhea, atrophy of sexual organs. He also refers to the frequency of

myoma of the uterus among those who have not become pregnant or who have long ceased to bear children. (Balls-Headley, art. "Etiology of Diseases of Female Genital Organs," Allbutt and Playfair, *System of Gynæcology*, 1896, p. 141.) It cannot, however, be said that he brings forward substantial evidence in favor of these beliefs. It may be added that in America, during recent years, leading gynecologists have recorded a number of cases in which widows on remarriage have shown marked improvement in uterine and pelvic conditions.

The question as to whether men or women suffer most from sexual abstinence, as well as the question whether definite morbid conditions are produced by such abstinence, remains, however, an obscure and debated problem. The available data do not enable us to answer it decisively. It is one of those subtle and complex questions which can only be investigated properly by a gynecologist who is also a psychologist. Incidentally, however, we have met and shall have occasion to meet with evidence bearing on this question. It is sufficient to say here, briefly, that it is impossible to believe, even if no evidence were forthcoming, that the exercise or non-exercise of so vastly important a function can make no difference to the organism generally. So far as the evidence goes, it may be said to indicate that the results of the abeyance of the sexual functions in healthy women in whom the sexual emotions have never been definitely aroused tend to be diffused and unconscious, as the sexual impulse itself often is, but that, in women in whom the sexual emotions have been definitely aroused and gratified, the results of sexual abstinence tend to be acute and conscious.

These acute results are at the present day very often due to premature ejaculation by nervous or neurasthenic husbands, the rapidity with which detumescence is reached in the husband allowing insufficient time for tumescence in the wife, who consequently fails to reach the orgasm. This has of late been frequently pointed out. Thus Kafemann (*Sexual-Probleme*, March, 1910, p. 194 et seq.) emphasizes the prevalence of sexual incompetence in men. Ferenczi, of Budapest (*Zentralblatt für Psychoanalyse*, 1910, ht. 1 and 2, p. 75), believes that the combination of neurasthenic husbands with resultantly nervous wives is extraordinarily common; even putting aside the neurasthenic, he considers it may be said that the whole male sex

in relation to women suffer from precocious ejaculation. He adds that it is often difficult to say whether the lack of harmony may not be due to retarded orgasm in the woman. He regards the influence of masturbation in early life as tending to quicken orgasm in man, while when practised by the other sex it tends to slow orgasm, and thus increases the disharmony. He holds, however, that the chief cause lies in the education of women with its emphasis on sexual repression; this works too well and the result is that when the external impediments to the sexual impulse are removed the impulse has become incapable of normal action. Porosz (British Medical Journal, April 1, 1911) has brought forward cases of serious nervous trouble in women which have been dispersed when the sexual weakness and premature ejaculation of the husband have been cured.

The true nature of the passivity of the female is revealed by the ease with which it is thrown off, more especially when the male refuses to accept his cue. Or, if we prefer to accept the analogy of a game, we may say that in the play of courtship the first move belongs to the male, but that, if he fails to play, it is then the female's turn to play.

Among many birds the males at mating time fall into a state of sexual frenzy, but not the females. "I cannot call to mind a single case," states an authority on birds (H.E. Howard, Zoölogist, 1902, p. 146), "where I have seen anything approaching frenzy in the female of any species while mating."

Another great authority on birds, a very patient and skillful observer, Mr. Edmund Selous, remarks, however, in describing the courting habits of the ruffs and reeves (Machetes pugnax) that, notwithstanding the passivity of the females beforehand, their movements during and after coitus show that they derive at least as much pleasure as the males. (E. Selous, "Selection in Birds," Zoölogist, Feb. and May, 1907.)

The same observer, after speaking of the great beauty of the male eider duck, continues: "These glorified males--there were a dozen of these, perhaps, to some six or seven females--swam closely about the latter, but more in attendance upon them than as actively pursuing them, for the females seemed themselves almost as active agents in the sport of being wooed as were their lovers in wooing them. The male bird first dipped down his head till his

beak just touched the water, then raised it again in a constrained and tense manner,--the curious rigid action so frequent in the nuptial antics of birds,--at the same time uttering his strange haunting note. The air became filled with it; every moment one or other of the birds--sometimes several together--with upturned bill would softly laugh or exclaim, and while the males did this, the females, turning excitedly, and with little eager demonstrations from one to another of them, kept lowering and extending forward the head and neck in the direction of each in turn.... I noticed that a female would often approach a male bird with her head and neck laid flat along the water as though in a very 'coming on' disposition, and that the male bird declined her advances. This, taken in conjunction with the actions of the female when courted by the male, appears to me to raise a doubt as to the universal application of the law that throughout nature the male, in courtship, is eager, and the female coy. Here, to all appearances, courtship was proceeding, and the birds had not yet mated. The female eider ducks, however,--at any rate, some of them,--appeared to be anything but coy." (*Bird Watching*, pp. 144-146.)

Among moor-hens and great-crested grebes sometimes what Selous terms "functional hermaphroditism" occurs and the females play the part of the male toward their male companions, and then repeat the sexual act with a reversion to the normal order, the whole to the satisfaction of both parties. (E. Selous, *Zoölogist*, 1902, p. 196.)

It is not only among birds that the female sometimes takes the active part, but also among mammals. Among white rats, for instance, the males are exceptionally eager. Steinach, who has made many valuable experiments on these animals (*Archiv für die Gesamte Physiologie*, Bd. lvi, 1894, p. 319), tells us that, when a female white rat is introduced into the cage of a male, he at once leaves off eating, or whatever else he may be doing, becomes indifferent to noises or any other source of distraction, and devotes himself entirely to her. If, however, he is introduced into her cage the new environment renders him nervous and suspicious, and then it is she who takes the active part, trying to attract him in every way. The impetuosity during heat of female animals of various species, when at length admitted to the male, is indeed well known to all who are

familiar with animals.

I have referred to the frequency with which, in the human species,--and very markedly in early adolescence, when the sexual impulse is in a high degree unconscious and unrestrainedly instinctive,--similar manifestations may often be noted. We have to recognize that they are not necessarily abnormal and still less pathological. They merely represent the unseasonable apparition of a tendency which in due subordination is implied in the phases of courtship throughout the animal world. Among some peoples and in some stages of culture, tending to withdraw the men from women and the thought of women, this phase of courtship and this attitude assume a prominence which is absolutely normal. The literature of the Middle Ages presents a state of society in which men were devoted to war and to warlike sports, while the women took the more active part in love-making. The medieval poets represent women as actively encouraging backward lovers, and as delighting to offer to great heroes the chastity they had preserved, sometimes entering their bed-chambers at night. Schultz (*Das Höfische Leben*, Bd. i, pp. 594-598) considers that these representations are not exaggerated. Cf. Krabbes, *Die Frau im Altfranzösischen Karls-Epos*, 1884, p. 20 et seq.; and M.A. Potter, *Sohrab and Rustem*, 1902, pp. 152-163.

Among savages and barbarous races in various parts of the world it is the recognized custom, reversing the more usual method, for the girl to take the initiative in courtship. This is especially so in New Guinea. Here the girls almost invariably take the initiative, and in consequence hold a very independent position. Women are always regarded as the seducers: "Women steal men." A youth who proposed to a girl would be making himself ridiculous, would be called a woman, and be laughed at by the girls. The usual method by which a girl proposes is to send a present to the youth by a third party, following this up by repeated gifts of food; the young man sometimes waits a month or two, receiving presents all the time, in order to assure himself of the girl's constancy before decisively accepting her advances. (A.C. Haddon, *Cambridge Expedition to Torres Straits*, vol. v, ch. viii; id., "Western Tribes of Torres Straits," *Journal of the Anthropological Institute*, vol. xix, February, 1890, pp. 314, 356, 394, 395, 411, 413; id., *Head Hunters*, pp. 158-164; R.E. Guise, "Tribes of the Wanigela River," *Journal of the*

Anthropological Institute_, new series, vol. i, February-May, 1899, p. 209.) Westermarck gives instances of races among whom the women take the initiative in courtship. (_History of Marriage_, p. 158; so also Finck, _Primitive Love and Love-stories_, 1899, p. 109 et seq.; and as regards Celtic women, see Rhys and Brynmor Jones, _The Welsh People_.)

There is another characteristic of great significance by which the sexual impulse in women differs from that in men: the widely unlike character of the physical mechanism involved in the process of coitus. Considering how obvious this difference is, it is strange that its fundamental importance should so often be underrated. In man the process of tumescence and detumescence is simple. In women it is complex. In man we have the more or less spontaneously erectile penis, which needs but very simple conditions to secure the ejaculation which brings relief. In women we have in the clitoris a corresponding apparatus on a small scale, but behind this has developed a much more extensive mechanism, which also demands satisfaction, and requires for that satisfaction the presence of various conditions that are almost antagonistic. Naturally the more complex mechanism is the more easily disturbed. It is the difference, roughly speaking, between a lock and a key. This analogy is far from indicating all the difficulties involved. We have to imagine a lock that not only requires a key to fit it, but should only be entered at the right moment, and, under the best conditions, may only become adjusted to the key by considerable use. The fact that the man takes the more active part in coitus has increased these difficulties; the woman is too often taught to believe that the whole function is low and impure, only to be submitted to at her husband's will and for his sake, and the man has no proper knowledge of the mechanism involved and the best way of dealing with it. The grossest brutality thus may be, and not infrequently is, exercised in all innocence by an ignorant husband who simply believes that he is performing his "marital duties." For a woman to exercise this physical brutality on a man is with difficulty possible; a man's pleasurable excitement is usually the necessary condition of the woman's sexual gratification. But the reverse is not the case, and, if the man is sufficiently ignorant or sufficiently coarse-grained to be satisfied with the woman's submission, he may easily become to her, in all innocence, a cause of torture.

To the man coitus must be in some slight degree pleasurable or it cannot take place at all. To the woman the same act which, under some circumstances, in the desire it arouses and the satisfaction it imparts,

will cause the whole universe to shrivel into nothingness, under other circumstances will be a source of anguish, physical and mental. This is so to some extent even in the presence of the right and fit man. There can be no doubt whatever that the mucus which is so profusely poured out over the external sexual organs in woman during the excitement of sexual desire has for its end the lubrication of the parts and the facilitation of the passage of the intromittent organ. The most casual inspection of the cold, contracted, dry vulva in its usual aspect and the same when distended, hot, and moist suffices to show which condition is and which is not that ready for intercourse, and until the proper condition is reached it is certain that coitus should not be attempted.

The varying sensitiveness of the female parts again offers difficulties. Sexual relations in women are, at the onset, almost inevitably painful; and to some extent the same experience may be repeated at every act of coitus. Ordinary tactile sensibility in the female genitourinary region is notably obtuse, but at the beginning of the sexual act there is normally a hyperesthesia which may be painful or pleasurable as excitement culminates, passing into a seeming anesthesia, which even craves for rough contact; so that in sexual excitement a woman normally displays in quick succession that same quality of sensibility to superficial pressure and insensibility to deep pressure which the hysterical woman exhibits simultaneously.

Thus we see that a highly important practical result follows from the greater complexity of the sexual apparatus in women and the greater difficulty with which it is aroused. In coitus the orgasm tends to occur more slowly in women than in men. It may easily happen that the whole process of detumescence is completed in the man before it has begun in his partner, who is left either cold or unsatisfied. This is one of the respects in which women remain nearer than men to the primitive stage of humanity.

In the Hippocratic treatise, *_Of Generation_*, it is stated that, while woman has less pleasure in coitus than man, her pleasure lasts longer. (*_Oeuvres d'Hippocrate_*, edition Littré, vol. vii, p. 477.)

Beaunis considers that the slower development of the orgasm in women is the only essential difference in the sexual process in men and women. (Beaunis, *_Les Sensations Internes_*, 1889, p. 151.) This characteristic of the sexual impulse in women, though

recognized for so long a period, is still far too often ignored or unknown. There is even a superstition that injurious results may follow if the male orgasm is not effected as rapidly as possible. That this is not so is shown by the experiences of the Oneida community in America, who in their system of sexual relationship carried prolonged intercourse without ejaculation to an extreme degree. There can be no doubt whatever that very prolonged intercourse gives the maximum amount of pleasure and relief to the woman. Not only is this the very decided opinion of women who have experienced it, but it is also indicated by the well-recognized fact that a woman who repeats the sexual act several times in succession often experiences more intense orgasm and pleasure with each repetition.

This point is much better understood in the East than in the West. The prolongation of the man's excitement, in order to give the woman time for orgasm, is, remarks Sir Richard Burton (*_Arabian Nights_*, vol. v, p. 76), much studied by Moslems, as also by Hindoos, who, on this account, during the orgasm seek to avoid overtension of muscles and to preoccupy the brain. During coitus they will drink sherbet, chew betel-nut, and even smoke. Europeans devote no care to this matter, and Hindoo women, who require about twenty minutes to complete the act, contemptuously call them "village cocks." I have received confirmation of Burton's statements on this point from medical correspondents in India.

While the European desires to perform as many acts of coitus in one night as possible, Breitenstein remarks, the Malay, as still more the Javanese, wishes, not to repeat the act many times, but to prolong it. His aim is to remain in the vagina for about a quarter of an hour. Unlike the European, also, he boasts of the pleasure he has given his partner far more than of his own pleasure. (Breitenstein, *_21 Jahre in India_*, theil i, "Borneo," p. 228.)

Jäger (*_Entdeckung der Seele_*, second edition, vol. i, 1884, p. 203), as quoted by Moll, explains the preference of some women for castrated men as due, not merely to the absence of risk of impregnation, but to the prolonged erections that take place in the castrated. Aly-Belfâdel remarks (*_Archivio di Psichiatria_*, 1903, p. 117) that he knows women who prefer old men in coitus

simply because of their delay in ejaculation which allows more time to the women to become excited.

A Russian correspondent living in Italy informs me that a Neapolitan girl of 17, who had only recently ceased to be a virgin, explained to him that she preferred _coitus in ore vulvæ_ to real intercourse because the latter was over before she had time to obtain the orgasm (or, as she put it, "the big bird has fled from the cage and I am left in the lurch"), while in the other way she was able to experience the orgasm twice before her partner reached the climax. "This reminds me," my correspondent continues, "that a Milanese cocotte once told me that she much liked intercourse with Jews because, on account of the circumcised penis being less sensitive to contact, they ejaculate more slowly than Christians. 'With Christians,' she said, 'it constantly happens that I am left unsatisfied because they ejaculate before me, while in coitus with Jews I sometimes ejaculate twice before the orgasm occurs in my partner, or, rather, I hold back the second orgasm until he is ready.' This is confirmed," my correspondent continues, "by what I was told by a Russian Jew, a student at the Zürich Polytechnic, who had a Russian comrade living with a mistress, also a Russian student, or pseudostudent. One day the Jew, going early to see his friend, was told to enter by a woman's voice and found his friend's mistress alone and in her chemise beside the bed. He was about to retire, but the young woman bade him stay and in a few minutes he was in bed with her. She told him that her lover had just gone away and that she never had sexual relief with him because he always ejaculated too soon. That morning he had left her so excited and so unrelieved that she was just about to masturbate--which she rarely did because it gave her headache--when she heard the Jew's voice, and, knowing that Jews are slower in coitus than Christians, she had suddenly resolved to give herself to him."

I am informed that the sexual power of negroes and slower ejaculation (see Appendix A) are the cause of the favor with which they are viewed by some white women of strong sexual passions in America, and by many prostitutes. At one time there was a special house in New York City to which white women resorted for these "buck lovers"; the women came heavily veiled and would inspect the penises of the men before making their

selection.

It is thus a result of the complexity of the sexual mechanism in women that the whole attitude of a woman toward the sexual relationship is liable to be affected disastrously by the husband's lack of skill or consideration in initiating her into this intimate mystery. Normally the stage of apparent repulsion and passivity, often associated with great sensitiveness, physical and moral, passes into one of active participation and aid in the consummation of the sexual act. But if, from whatever cause, there is partial arrest on the woman's side of this evolution in the process of courtship, if her submission is merely a mental and deliberate act of will, and not an instinctive and impulsive participation, there is a necessary failure of sexual relief and gratification. When we find that a woman displays a certain degree of indifference in sexual relationships, and a failure of complete gratification, we have to recognize that the fault may possibly lie, not in her, but in the defective skill of a lover who has not known how to play successfully the complex and subtle game of courtship. Sexual coldness due to the shock and suffering of the wedding-night is a phenomenon that is far too frequent.[172] Hence it is that many women may never experience sexual gratification and relief, through no defect on their part, but through the failure of the husband to understand the lover's part. We make a false analogy when we compare the courtship of animals exclusively with our own courtships before marriage. Courtship, properly understood, is the process whereby both the male and the female are brought into that state of sexual tumescence which is a more or less necessary condition for sexual intercourse. The play of courtship cannot, therefore, be considered to be definitely brought to an end by the ceremony of marriage; it may more properly be regarded as the natural preliminary to every act of coitus.

Tumescence is not merely a more or less essential condition for proper sexual intercourse. It is probably of more fundamental significance as one of the favoring conditions of impregnation. This has, indeed, been long recognized. Van Swieten, when consulted by the childless Maria Theresa, gave the opinion "*Ego vero censeo, vulvam Sacratissimæ Majestatis ante coitum diutius esse titillandam,*" and thereafter she had many children. "I think it very nearly certain," Matthews Duncan wrote (*Goulstonian Lectures on Sterility in Woman*, 1884, p. 96), "that desire and pleasure in due or moderate degree are very important aids to, or predisposing causes of, fecundity," as bringing into action the

complicated processes of fecundation. Hirst (*Text-book of Obstetrics*, 1899, p. 67) mentions the case of a childless married woman who for six years had had no orgasm during intercourse; then it occurred at the same time as coitus, and pregnancy resulted.

Kisch is very decidedly of the same opinion, and considers that the popular belief on this point is fully justified. It is a fact, he states, that an unfaithful wife is more likely to conceive with her lover than with her husband, and he concludes that, whatever the precise mechanism may be, "sexual excitement on the woman's part is a necessary link in the chain of conditions producing impregnation." (E.H. Kisch, *Die Sterilität des Weibes*, 1886, p. 99.) Kisch believes (p. 103) that in the majority of women sexual pleasure only appears gradually, after the first cohabitation, and then develops progressively, and that the first conception usually coincides with its complete awakening. In 556 cases of his own the most frequent epoch of first impregnation was found to be between ten and fifteen months after marriage.

The removal of sexual frigidity thus becomes a matter of some importance. This removal may in some cases be effected by treatment through the husband, but that course is not always practicable. Dr. Douglas Bryan, of Leicester, informs me that in several cases he has succeeded in removing sexual coldness and physical aversion in the wife by hypnotic suggestion. The suggestions given to the patient are "that all her womanly natural feelings would be quickly and satisfactorily developed during coitus; that she would experience no feeling of disgust and nausea, would have no fear of the orgasm not developing; that there would be no involuntary resistance on her part." The fact that such suggestions can be permanently effective tends to show how superficial the sexual "anesthesia" of women usually is.

Not only, therefore, is the apparatus of sexual excitement in women more complex than in men, but--in part, possibly as a result of this greater complexity--it much more frequently requires to be actively aroused. In men tumescence tends to occur almost spontaneously, or under the simple influence of accumulated semen. In women, also, especially in those who live a natural and healthy life, sexual excitement also tends to occur spontaneously, but by no means so frequently as in men. The comparative

rarity of sexual dreams in women who have not had sexual relationships alone serves to indicate this sexual difference. In a very large number of women the sexual impulse remains latent until aroused by a lover's caresses. The youth spontaneously becomes a man; but the maiden--as it has been said--"must be kissed into a woman."

One result of this characteristic is that, more especially when love is unduly delayed beyond the first youth, this complex apparatus has difficulty in responding to the unfamiliar demands of sexual excitement. Moreover, delayed normal sexual relations, when the sexual impulse is not absolutely latent, tend to induce all degrees of perverted or abnormal sexual gratification, and the physical mechanism when trained to respond in other ways often fails to respond normally when, at last, the normal conditions of response are presented. In all these ways passivity and even aversion may be produced in the conjugal relationship. The fact that it is almost normally the function of the male to arouse the female, and that the greater complexity of the sexual mechanism in women leads to more frequent disturbance of that mechanism, produces a simulation of organic sexual coldness which has deceived many.

An instructive study of cases in which the sexual impulse has been thus perverted has been presented by Smith Baker ("The Neuropsychical Element in Conjugal Aversion," *Journal of Nervous and Mental Disease*, vol. xvii, September, 1892). Raymond and Janet, who believes that sexual coldness is extremely frequent in marriage, and that it plays an important part in the causation of physical and moral troubles, find that it is most often due to masturbation. (*Les Obsessions*, vol. ii, p. 307.) Adler, after discussing the complexity of the feminine sexual mechanism, and the difficulty which women find in obtaining sexual gratification in normal coitus, concludes that "masturbation is a frequent, perhaps the most frequent, cause of defective sexual sensibility in women." (*Op. cit.*, p. 119.) He remarks that in women masturbation usually has less resemblance to normal coitus than in men and involves very frequently the special excitation of parts which are not the chief focus of excitement in coitus, so that coitus fails to supply the excitation which has become habitual (pp. 113-116). In the discussion of "Auto-erotism" in the first volume of these *Studies*, I had already referred to the divorce between the physical and the ideal sides of love which may, especially in women, be induced by masturbation.

Another cause of inhibited sexual feeling has been brought forward. A married lady with normal sexual impulse states (*_Sexual-Probleme_*, April, 1912, p. 290) that she cannot experience orgasm and sexual satisfaction when the intercourse is not for conception. This is a psychic inhibition independent of any disturbance due to the process of prevention. She knows other women who are similarly affected. Such an inhibition must be regarded as artificial and abnormal, since the final result of sexual intercourse, under natural and normal conditions, forms no essential constituent of the psychic process of intercourse.

As a result of the fact that in women the sexual emotions tend not to develop great intensity until submitted to powerful stimulation, we find that the maximum climax of sexual emotion tends to fall somewhat later in a woman's life than in a man's. Among animals generally there appears to be frequently traceable a tendency for the sexual activities of the male to develop at a somewhat earlier age than those of the female. In the human, species we may certainly trace the same tendency. As the great physiologist, Burdach, pointed out, throughout nature, with the accomplishment of the sexual act the part of the male in the work of generation comes to an end; but that act represents only the beginning of a woman's generative activity.

A youth of 20 may often display a passionate ardor in love which is very seldom indeed found in women who are under 25. It is rare for a woman, even though her sexual emotions may awaken at puberty or earlier, to experience the great passion of her life until after the age of 25 has been passed. In confirmation of this statement, which is supported by daily observation, it may be pointed out that nearly all the most passionate love-letters of women, as well as their most passionate devotions, have come from women who had passed, sometimes long passed, their first youth. When Heloise wrote to Abelard the first of the letters which have come down to us she was at least 32. Mademoiselle Aissé's relation with the Chevalier began when she was 32, and when she died, six years later, the passion of each was at its height. Mary Wollstonecraft was 34 when her love-letters to Imlay began, and her child was born in the following year. Mademoiselle de Lespinasse was 43 when she began to write her letters to M. de Guibert. In some cases the sexual impulse may not even appear until after the period of the menopause has been passed.[173]

In Roman times Ovid remarked (*_Ars Amatoria_*, lib. ii) that a woman fails to understand the art of love until she has reached

the age of 35. "A girl of 18," said Stendhal (*_De l'Amour_*, ch. viii), "has not the power to crystallize her emotions; she forms desires that are too limited by her lack of experience in the things of life, to be able to love with such passion as a woman of 28." "Sexual needs," said Restif de la Bretonne (*_Monsieur Nicolas_*, vol. xi, p. 221), "often only appears in young women when they are between 26 and 27 years of age; at least, that is what I have observed."

Erb states that it is about the middle of the twenties that women begin to suffer physically, morally, and intellectually from their sexual needs. Nyström (*_Das Geschlechtsleben_*, p. 163) considers that it is about the age of 30 that a woman first begins to feel conscious of sex needs. In a case of Adler's (*_op. cit._*, p. 141), sexual feelings first appeared after the birth of the third child, at the age of 30. Forel (*_Die Sexuelle Frage_*, 1906, p. 219) considers that sexual desire in woman is often strongest between the ages of 30 and 40. Leith Napier (*_Menopause_*, p. 94) remarks that from 28 to 30 is often an important age in woman who have retained their virginity, erotism then appearing with the full maturity of the nervous system. Yellowlees (art. "Masturbation," *_Dictionary of Psychological Medicine_*), again, states that at about the age of 33 some women experience great sexual irritability, often resulting in masturbation. Audiffrent (*_Archives d'Anthropologie Criminelle_*, Jan. 15, 1902, p. 3) considers that it is toward the age of 30 that a woman reaches her full moral and physical development, and that at this period her emotional and idealizing impulses reach a degree of intensity which is sometimes irresistible. It has already been mentioned that Matthews Duncan's careful inquiries showed that it is between the ages of 30 and 34 that the largest proportion of women experience sexual desire and sexual pleasure. It may be remarked, also, that while the typical English novelists, who have generally sought to avoid touching the deeper and more complex aspects of passion, often choose very youthful heroines, French novelists, who have frequently had a predilection for the problems of passion, often choose heroines who are approaching the age of 30.

Hirschfeld (*_Von Wesen der Liebe_*, p. 26) was consulted by a lady who, being without any sexual desires or feelings, married an inverted man in order to live with him a life of simple

comradeship. Within six months, however, she fell violently in love with her husband, with the full manifestation of sexual feelings and accompanying emotions of jealousy. Under all the circumstances, however, she would not enter into sexual relationship with her husband, and the torture she endured became so acute that she desired to be castrated. In this connection, also, I may mention a case, which has been communicated to me from Glasgow, of a girl--strong and healthy and menstruating regularly since the age of 17--who was seduced at the age of 20 without any sexual desire on her part, giving birth to a child nine months later. Subsequently she became a prostitute for three years, and during this period had not the slightest sexual desire or any pleasure in sexual connection. Thereafter she met a poor lad with whom she has full sexual desire and sexual pleasure, the result being that she refuses to go with any other man, and consequently is almost without food for several days every week.

The late appearance of the great climax of sexual emotion in women is indicated by a tendency to nervous and psychic disturbances between the ages of 25 and about 33, which has been independently noted by various alienists (though it may be noted that 25 to 30 is not an unusual age for first attacks of insanity in men also). Thus, Krafft-Ebing states that adult unmarried women between the ages of 25 and 30 often show nervous symptoms and peculiarities. (Krafft-Ebing, "Ueber Neurosen und Psychosen durch Sexuelle Abstinenz," *Jahrbücher für Psychiatrie*, Bd. viii, ht. 1-4, 1888.) Pitres and Régis find also (*Comptes-rendus XIIe Congrès International de Médecine*, Moscow, 1897, vol. iv, p. 45) that obsessions, which are commoner in women than in men and are commonly connected in their causation with strong moral emotion, occur in women chiefly between the ages of 26 and 30, though in men much earlier. The average age at which in England women inebriates begin drinking in excess is 26. (*British Medical Journal*, Sept. 2, 1911, p. 518.)

A case recorded by Sérieux is instructive as regards the development of the sexual impulse, although it comes within the sphere of mental disorder. A woman of 32 with bad heredity had in childhood had weak health and become shy, silent, and fond of solitude, teased by her companions and finding consolation in hard work. Though very emotional, she never, even in the vaguest form, experienced any of those feelings and aspirations which

reveal the presence of the sexual impulse. She had no love of dancing and was indifferent to any embraces she might chance to receive from young men. She never masturbated or showed inverted feelings. At the age of 23 she married. She still, however, experienced no sexual feelings; twice only she felt a faint sensation of pleasure. A child was born, but her home was unhappy on account of her husband's drunken habits. He died and she worked hard for her own living and the support of her mother. Then at the age of 31 a new phase occurs in her life: she falls in love with the master of her workshop. It was at first a purely psychic affection, without any mixture of physical elements; it was enough to see him, and she trembled when she touched anything that belonged to him. She was constantly thinking about him; she loved him for his eyes, which seemed to her those of her own child, and especially for his intelligence. Gradually, however, the lower nervous centers began to take part in these emotions; one day in passing her the master chanced to touch her shoulder; this contact was sufficient to produce sexual turgescence. She began to masturbate daily, thinking of her master, and for the first time in her life she desired coitus. She evoked the image of her master so constantly and vividly that at last hallucinations of sight, touch, and hearing appeared, and it seemed to her that he was present. These hallucinations were only with difficulty dissipated. (P. Sérieux, *Les Anomalies de L'Instinct Sexuel*, 1888, p. 50.) This case presents in an insane form a phenomenon which is certainly by no means uncommon and is very significant. Up to the age of 31 we should certainly have been forced to conclude that this woman was sexually anesthetic to an almost absolute degree. In reality, we see this was by no means the case. Weak health, hard work, and a brutal husband had prolonged the latency of the sexual emotions; but they were there, ready to explode with even insane intensity (this being due to the unsound heredity) in the presence of a man who appealed to these emotions.

In connection with the late evolution of the sexual emotions in women reference may be made to what is usually termed "old maid's insanity," a condition not met with in men. In these cases, which are not, indeed, common, single women who have led severely strict and virtuous lives, devoting themselves to religious or intellectual work, and carefully repressing the animal side of their natures, at last, just before the climacteric, experience

an awakening of the erotic impulse; they fall in love with some unfortunate man, often a clergyman, persecute him with their attentions, and frequently suffer from the delusion that he reciprocates their affections.

When once duly aroused, there cannot usually be any doubt concerning the strength of the sexual impulse in normal and healthy women. There would, however, appear to be a distinct difference between the sexes at this point also. Before sexual union the male tends to be more ardent; after sexual union it is the female who tends to be more ardent. The sexual energy of women, under these circumstances, would seem to be the greater on account of the long period during which it has been dormant.

Sinibaldus in the seventeenth century, in his *_Geneanthropeia_*, argued that, though women are cold at first, and aroused with more difficulty and greater slowness than men, the flame of passion spreads in them the more afterward, just as iron is by nature cold, but when heated gives a great degree of heat. Similarly Mandeville said of women that "their passions are not so easily raised nor so suddenly fixed upon any particular object; but when this passion is once rooted in women it is much stronger and more durable than in men, and rather increases than diminishes by enjoying the person of the beloved." (*_A Modest Defence of Public Stews_*, 1724, p. 34.) Burdach considered that women only acquire the full enjoyment of their general strength after marriage and pregnancy, while it is before marriage that men have most vigor. Schopenhauer also said that a man's love decreases with enjoyment, and a woman's increases. And Ellen Key has remarked (*_Love and Marriage_*) that "where there is no mixture of Southern blood it is a long time, sometimes indeed not till years after marriage, that the senses of the Northern women awake to consciousness."

Even among animals this tendency seems to be manifested. Edmund Selous (*_Bird Watching_*, p. 112) remarks, concerning sea-gulls: "Always, or almost always, one of the birds--and this I take to be the female--is more eager, has a more soliciting manner and tender begging look than the other. It is she who, as a rule, draws the male bird on. She looks fondly up at him, and, raising her bill to his, as though beseeching a kiss, just touches with it, in raising, the feathers of the throat--an action light, but full of endearment. And in every way she shows herself the most

desirous, and, in fact, so worries and pesters the poor male gull that often, to avoid her importunities, he flies away. This may seem odd, but I have seen other instances of it. No doubt, in actual courting, before the sexes are paired, the male bird is usually the most eager, but after marriage the female often becomes the wooer. Of this I have seen some marked instances." Selous mentions especially the plover, kestrel hawk, and rook.

In association with the fact that women tend to show an increase of sexual ardor after sexual relationships have been set up may be noted the probably related fact that sexual intercourse is undoubtedly less injurious to women than to men. Other things being equal, that is to say, the threshold of excess is passed very much sooner by the man than by the woman. This was long ago pointed out by Montaigne. The ancient saying, "*_Omne animal post coitum triste_*," is of limited application at the best, but certainly has little reference to women.[174] Alacrity, rather than languor, as Robin has truly observed,[175] marks a woman after coitus, or, as a medical friend of my own has said, a woman then goes about the house singing.[176] It is, indeed, only after intercourse with a woman for whom, in reality, he feels contempt that a man experiences that revulsion of feeling described by Shakespeare (sonnet cxxix). Such a passage should not be quoted, as it sometimes has been quoted, as the representation of a normal phenomenon. But, with equal gratification on both sides, it remains true that, while after a single coitus the man may experience a not unpleasant lassitude and readiness for sleep, this is rarely the case with his partner, for whom a single coitus is often but a pleasant stimulus, the climax of satisfaction not being reached until a second or subsequent act of intercourse. "Excess in venery," which, rightly or wrongly, is set down as the cause of so many evils in men, seldom, indeed, appears in connection with women, although in every act of venery the woman has taken part.[177]

That women bear sexual excesses better than men was noted by Cabanis and other early writers. Alienists frequently refer to the fact that women are less liable to be affected by insanity following such excesses. (See, e.g., Maudsley, "Relations between Body and Mind," *_Lancet_*, May 28, 1870; and G. Savage, art. "Marriage and Insanity" in *_Dictionary of Psychological Medicine_*.) Trousseau remarked on the fact that women are not exhausted by repeated acts of coitus within a short period, notwithstanding that the nervous excitement in their case is as great, if not greater, and he considered that this showed that

the loss of semen is a cause of exhaustion in men. Löwenfeld (*_Sexualleben und Nervenleiden_*, pp. 74, 153) states that there cannot be question that the nervous system in women is less influenced by the after-effects of coitus than in men. Not only, he remarks, are prostitutes very little liable to suffer from nervous overstimulation, and neurasthenia and hysteria when occurring in them be easily traceable to other causes, but "healthy women who are not given to prostitution, when they indulge in very frequent sexual intercourse, provided it is practised normally, do not experience the slightest injurious effect. I have seen many young married couples where the husband had been reduced to a pitiable condition of nervous prostration and general discomfort by the zeal with which he had exercised his marital duties, while the wife had been benefited and was in the uninterrupted enjoyment of the best health." This experience is by no means uncommon.

A correspondent writes: "It is quite true that the threshold of excess is less easily reached by women than by men. I have found that women can reach the orgasm much more frequently than men. Take an ordinary case. I spend two hours with ----. I have the orgasm 3 times, with difficulty; she has it 6 or 8, or even 10 or 12, times. Women can also experience it a second or third time in succession, with no interval between. Sometimes the mere fact of realizing that the man is having the orgasm causes the woman to have it also, though it is true that a woman usually requires as many minutes to develop the orgasm as a man does seconds." I may also refer to the case recorded in another part of this volume in which a wife had the orgasm 26 times to her husband's twice.

Hutchinson, under the name of post-marital amblyopia (*_Archives of Surgery_*, vol. iv, p. 200), has described a condition occurring in men in good health who soon after marriage become nearly blind, but recover as soon as the cause is removed. He mentions no cases in women due to coitus, but finds that in women some failure of sight may occur after parturition.

Näcke states that, in his experience, while masturbation is, apparently, commoner in insane men than in insane women, masturbation repeated several times a day is much commoner in the women. (P. Näcke, "Die Sexuellen Perversitäten in der Irrenanstalt," *_Psychiatrische Bladen_*, 1899, No. 2.)

Great excesses in masturbation seem also to be commoner among women who may be said to be sane than among men. Thus, Bloch (New Orleans Medical Journal, 1896) records the case of a young married woman of 25, of bad heredity, who had suffered from almost life-long sexual hyperesthesia, and would masturbate fourteen times daily during the menstrual periods.

With regard to excesses in coitus the case may be mentioned of a country girl of 17, living in a rural district in North Carolina where prostitution was unknown, who would cohabit with men almost openly. On one Sunday she went to a secluded school-house and let three or four men wear themselves out cohabiting with her. On another occasion, at night, in a field, she allowed anyone who would to perform the sexual act, and 25 men and boys then had intercourse with her. When seen she was much prostrated and with a tendency to spasm, but quite rational. Subsequently she married and attacks of this nature became rare.

Mr. Lawson made an "attested statement" of what he had observed among the Marquesan women. "He mentions one case in which he heard a parcel of boys next morning count over and name 103 men who during the night had intercourse with one woman." (Medico-Chirurgical Review, 1871, vol. ii, p. 360, apparently quoting Chevers.) This statement seems open to question, but, if reliable, would furnish a case which must be unique.

There is a further important difference, though intimately related to some of the differences already mentioned, between the sexual impulse in women and in men. In women it is at once larger and more diffused. As Sinibaldus long ago said, the sexual pleasure of men is intensive, of women extensive. In men the sexual impulse is, as it were, focused to a single point. This is necessarily so, for the whole of the essentially necessary part of the male in the process of human procreation is confined to the ejaculation of semen into the vagina. But in women, mainly owing to the fact that women are the child-bearers, in place of one primary sexual center and one primary erogenous region, there are at least three such sexual centers and erogenous regions: the clitoris (corresponding to the penis), the vaginal passage up to the womb, and the nipple. In both sexes there are other secondary and reflex centers, but there is good reason for believing that these are more numerous and more widespread in women than in men.[178] How numerous the secondary sexual centers in women may be is

indicated by the case of a woman mentioned by Moraglia, who boasted that she knew fourteen different ways of masturbating herself.

This great diffusion of the sexual impulse and emotions in women is as visible on the psychic as on the physical side. A woman can find sexual satisfaction in a great number of ways that do not include the sexual act proper, and in a great number of ways that apparently are not physical at all, simply because their physical basis is diffused or is to be found in one of the outlying sexual zones.

It is, moreover, owing to the diffused character of the sexual emotions in women that it so often happens that emotion really having a sexual origin is not recognized as such even by the woman herself. It is possible that the great prevalence in women of the religious emotional state of "storm and stress," noted by Professor Starbuck,[179] is largely due to unemployed sexual impulse. In this and similar ways it happens that the magnitude of the sexual sphere in woman is unrealized by the careless observer.

A number of converging facts tend to indicate that the sexual sphere is larger, and more potent in its influence on the organism, in women than in men. It would appear that among the males and females of lower animals the same difference may be found. It is stated that in birds there is a greater flow of blood to the ovaries than to the testes.

In women the system generally is more affected by disturbances in the sexual sphere than in men. This appears to be the case as regards the eye. "The influence of the sexual system upon the eye in man," Power states, "is far less potent, and the connection, in consequence, far less easy to trace than in woman." (H. Power, "Relation of Ophthalmic Disease to the Sexual Organs," Lancet, November 26, 1887.)

The greater predominance of the sexual system in women on the psychic side is clearly brought out in insane conditions. It is well known that, while satyriasis is rare, nymphomania is comparatively common. These conditions are probably often forms of mania, and in mania, while sexual symptoms are common in men, they are often stated to be the rule in women (see, e.g., Krafft-Ebing, Psychopathia Sexualis, tenth edition, English translation, p. 465). Bouchereau, in noting this difference in

the prevalence of sexual manifestations during insanity, remarks that it is partly due to the naturally greater dependence of women on the organs of generation, and partly to the more active, independent, and laborious lives of men; in his opinion, satyriasis is specially apt to develop in men who lead lives resembling those of women. (Bouchereau, art. "Satyriasis," Dictionnaire Encyclopédique des Sciences Médicales.) Again, postconnubial insanity is very much commoner in women than in men, a fact which may indicate the more predominant part played by the sexual sphere in women. (Savage, art. "Marriage and Insanity," Dictionary of Psychological Medicine.)

Insanity tends to remove the artificial inhibitory influences that rule in ordinary life, and there is therefore significance in such a fact as that the sexual appetite is often increased in general paralysis and to a notable extent in women. (Pactet and Colin, Les Aliénés devant la Justice, 1902, p. 122.)

Näcke, from his experiences among the insane, makes an interesting and possibly sound distinction regarding the character of the sexual manifestations in the two sexes. Among men he finds these manifestations to be more of a reflex and purely spinal nature and chiefly manifested in masturbation; in women he finds them to be of a more cerebral character, and chiefly manifested in erotic gestures, lascivious conversation, etc. The sexual impulse would thus tend to involve to a greater extent the higher psychic region in women than in men.

Forel likewise (Die Sexuelle Frage, 1906, p. 276), remarking on the much greater prevalence of erotic manifestations among insane women than insane men (and pointing out that it is by no means due merely to the presence of a male doctor, for it remains the same when the doctor is a woman), considers that it proves that in women the sexual impulse resides more prominently in the higher nervous centers and in men in the lower centers. (As regards the great prevalence of erotic manifestations among the female insane, I may also refer to Claye Shaw's interesting observations, "The Sexes in Lunacy," St. Bartholomew's Hospital Reports, vol. xxiv, 1888; also quoted in Havelock Ellis, Man and Woman, p. 370 et seq.) Whether or not we may accept Näcke's and Forel's interpretation of the facts, which is at least doubtful, there can be little doubt that the sexual impulse is

more fundamental in women. This is indicated by Näcke's observation that among idiots sexual manifestations are commoner in females than in males. Of 16 idiot girls, of the age of 16 and under, 15 certainly masturbated, sometimes as often as fourteen times a day, while the remaining girl probably masturbated; but of 25 youthful male idiots only 1 played with his penis. (P. Näcke, "Die Sexuellen Perversitäten in der Irrenanstalt," *_Psychiatrische Bladen_*, 1899, No. 2, pp. 9, 12.) On the physical side Bourneville and Sollier found (*_Progrès médical_*, 1888) that puberty is much retarded in idiot and imbecile boys, while J. Voisin (*_Annales d'Hygiène Publique_*, June, 1894) found that in idiot and imbecile girls, on the contrary, there is no lack of full sexual development or retardation of puberty, while masturbation is common. In women, it may be added, as Ball pointed out (*_Folie érotique_*, p. 40), sexual hallucinations are especially common, while under the influence of anesthetics erotic manifestations and feelings are frequent in women, but rare in men. (Havelock Ellis, *_Man and Woman_*, p. 256.)

The fact that the first coitus has a much more profound moral and psychic influence on a woman than on a man would also seem to indicate how much more fundamental the sexual region is in women. The fact may be considered as undoubted. (It is referred to by Marro, *_La Pubertà_*, p. 460.) The mere physical fact that, while in men coitus remains a merely exterior contact, in women it involves penetration into the sensitive and virginal interior of the body would alone indicate this difference.

We are told that in the East there was once a woman named Moârbeda who was a philosopher and considered to be the wisest woman of her time. When Moârbeda was once asked: "In what part of a woman's body does her mind reside?" she replied: "Between her thighs." To many women,--perhaps, indeed, we might even say to most women,--to a certain extent may be applied--and in no offensive sense--the dictum of the wise woman of the East; in a certain sense their brains are in their wombs. Their mental activity may sometimes seem to be limited; they may appear to be passing through life always in a rather inert or dreamy state; but, when their sexual emotions are touched, then at once they spring into life; they become alert, resourceful, courageous, indefatigable. "But when I am not in love I am nothing!" exclaimed a woman when reproached by a French magistrate for living with a thief. There are many women who could truly make the same statement, not many men. That emotion, which, one is tempted

to say, often unmans the man, makes the woman for the first time truly herself.

"Women are more occupied with love than men," wrote De Sénancour (*De l'Amour*, vol. ii, p. 59); "it shows itself in all their movements, animates their looks, gives to their gestures a grace that is always new, to their smiles and voices an inexpressible charm; they live for love, while many men in obeying love feel that they are forgetting themselves."

Restif de la Bretonne (*Monsieur Nicolas*, vol. vi, p. 223) quotes a young girl who well describes the difference which love makes to a woman: "Before I vegetated; now all my actions have a motive, an end; they have become important. When I wake my first thought is 'Someone is occupied with me and desires me.' I am no longer alone, as I was before; another feels my existence and cherishes it," etc.

"One is surprised to see in the south," remarks Bonstetten, in his suggestive book, *L'Homme du Midi et l'Homme du Nord* (1824),--and the remark by no means applies only to the south,--"how love imparts intelligence even to those who are most deficient in ideas. An Italian woman in love is inexhaustible in the variety of her feelings, all subordinated to the supreme emotion which dominates her. Her ideas follow one another with prodigious rapidity, and produce a lambent play which is fed by her heart alone. If she ceases to love, her mind becomes merely the scoria of the lava which yesterday had been so bright."

Cabanis had already made some observations to much the same effect. Referring to the years of nubility following puberty, he remarks: "I have very often seen the greatest fecundity of ideas, the most brilliant imagination, a singular aptitude for the arts, suddenly develop in girls of this age, only to give place soon afterward to the most absolute mental mediocrity." (Cabanis, *De l'Influence des Sexes*, etc., *Rapports du Physique et du Morale de l'Homme*.)

This phenomenon seems to be one of the indications of the immense organic significance of the sexual relations. Woman's part in the world is less obtrusively active than man's, but there is a moment when nature cannot dispense with energy and mental vigor in women, and that is during the

reproductive period. The languidest woman must needs be alive when her sexual emotions are profoundly stirred. People often marvel at the infatuation which men display for women who, in the eyes of all the world, seem commonplace and dull. This is not, as we usually suppose, always entirely due to the proverbial blindness of love. For the man whom she loves, such a woman is often alive and transformed. He sees a woman who is hidden from all the world. He experiences something of that surprise and awe which Dostoieffsky felt when the seemingly dull and brutish criminals of Siberia suddenly exhibited gleams of exquisite sensibility.

In women, it must further be said, the sexual impulse shows a much more marked tendency to periodicity than in men; not only is it less apt to appear spontaneously, but its spontaneous manifestations are in a very pronounced manner correlated with menstruation. A woman who may experience almost overmastering sexual desire just before, during, or after the monthly period may remain perfectly calm and self-possessed during the rest of the month. In men such irregularities of the sexual impulse are far less marked. Thus it is that a woman may often appear capricious, unaccountable, or cold, merely because her moments of strong emotion have been physiologically confined within a limited period. She may be one day capable of audacities of which on another the very memory might seem to have left her.

Not only is the intensity of the sexual impulse in women, as compared to men, more liable to vary from day to day, or from week to week, but the same greater variability is marked when we compare the whole cycle of life in women to that of men. The stress of early womanhood, when the reproductive functions are in fullest activity, and of late womanhood, when they are ceasing, produces a profound organic fermentation, psychic as much as physical, which is not paralleled in the lives of men. This greater variability in the cycle of a woman's life as compared with a man's is indicated very delicately and precisely by the varying incidence of insanity, and is made clearly visible in a diagram prepared by Marro showing the relative liability to mental diseases in the two sexes according to age.[180] At the age of 20 the incidence of insanity in both sexes is equal; from that age onward the curve in men proceeds in a gradual and equable manner, with only the slightest oscillation, on to old age. But in women the curve is extremely irregular; it remains high during all the years from 20 to 30, instead of falling like the masculine curve; then it falls rapidly to considerably below the masculine curve, rising again considerably above the masculine level during the climacteric years from 40 to 50, after which age the two sexes remain fairly close together

to the end of life. Thus, as measured by the test of insanity, the curve of woman's life, in the sudden rise and sudden fall of its sexual crisis, differs from the curve of man's life and closely resembles the minor curve of her menstrual cycle.

The general tendency of this difference in sexual life and impulse is to show a greater range of variation in women than in men. Fairly uniform, on the whole, in men generally and in the same man throughout mature life, sexual impulse varies widely between woman and woman, and even in the same woman at different periods.

FOOTNOTES:

[169] Ovid remarks (*_Ars Amatoria_*, bk. i) that, if men were silent, women would take the active and suppliant part.

[170] Ferrand, *_De la Maladie d'Amour_*, 1623, ch. ii.

[171] Tarde, *_Archives d'Anthropologie Criminelle_*, May 15, 1897. Marro, who quotes this observation (*_Pubertà_*, p. 467; in French edition, p. 61), remarks that his own evidence lends some support to Lombroso's conclusion that under ordinary circumstances woman's sensory acuteness is less than that of man. He is, however, inclined to impute this to defective attention; within the sexual sphere women's attention becomes concentrated, and their sensory perceptions then go far beyond those of men. There is probably considerable truth in this subtle observation.

[172] A well-known gynecologist writes from America: "Abhorrence due to suffering on first nights I have repeatedly seen. One very marked case is that of a fine womanly young woman with splendid figure; she is a very good woman, and admires her husband, but, though she tries to develop desire and passion, she cannot succeed. I fear the man will some day appear who will be able to develop the latent feelings."

[173] It is curious that, while the sexual impulse in women tends to develop at a late age more frequently than in men, it would also appear to develop more frequently at a very early age than in the other sex. The majority of cases of precocious sexual development seems to be in female children. W. Roger Williams ("Precocious Sexual Development," *_British Gynæcological Journal_*, May, 1902) finds that 80 such cases have been recorded in females and only 20 in males, and, while 13 is the earliest

age at which boys have proved virile, girls have been known to conceive at 8.

[174] I find the same remark made by Plazzonus in the seventeenth century.

[175] Art. "Fécondation," _Dictionnaire Encyclopédique des Sciences Médicales_.

[176] This also is an ancient remark, for in the early treatise _De Secretis Mulierum_, once attributed to Michael Scot, it is stated, concerning the woman who finds pleasure in coitus, "cantat libenter."

[177] It is scarcely necessary to add that prostitutes can furnish little evidence one way or the other. Not only may prostitutes refuse to participate in the sexual orgasm, but the evils of a prostitute's life are obviously connected with causes quite other than mere excess of sexual gratification.

[178] This is, for instance, indicated by the experiments of Gualino concerning the sexual sensitiveness of the lips (_Archivio di Psichiatria_, 1904, fasc. 3). He found that mechanical irritation applied to the lips produced more or less sexual feeling in 12 out of 20 women, but in only 10 out of 25 men, i.e., in three-fifths of the women and two-fifths of the men.

[179] "Adolescence is for women primarily a period of storm and stress, while for men it is in the highest sense a period of doubt," (Starbuck, _Psychology of Religion_, p. 241.) It is interesting to note that in the religious sphere, also, the emotions of women are more diffused than those of men; Starbuck confirms the conclusion of Professor Coe that, while women have at least as much religious emotion as men, in them it is more all pervasive, and they experience fewer struggles and acute crises. (Ibid., p. 80.)

[180] Marro, _La Pubertà_, p. 233. This table covers all those cases, nearly 3000, of patients entering the Turin asylum, from 1886 to 1895, in which the age of the first appearance of insanity was known.

Summary of Conclusions.

In conclusion it may be worth while to sum up the main points brought out in this brief discussion of a very large question. We have seen that there are two streams of opinion regarding the relative strength of the sexual impulse in men and women: one tending to regard it as greater in men, the other as greater in women. We have concluded that, since a large body of facts may be brought forward to support either view, we may fairly hold that, roughly speaking, the distribution of the sexual impulse between the two sexes is fairly balanced.

We have, however, further seen that the phenomena are in reality too complex to be settled by the usual crude method of attempting to discover quantitative differences in the sexual impulse. We more nearly get to the bottom of the question by a more analytic method, breaking up our mass of facts into groups. In this way we find that there are certain well-marked characteristics by which the sexual impulse in women differs from the same impulse in men: 1. It shows greater apparent passivity. 2. It is more complex, less apt to appear spontaneously, and more often needing to be aroused, while the sexual orgasm develops more slowly than in men. 3. It tends to become stronger after sexual relationships are established. 4. The threshold of excess is less easily reached than in men. 5. The sexual sphere is larger and more diffused. 6. There is a more marked tendency to periodicity in the spontaneous manifestations of sexual desire. 7. Largely as a result of these characteristics, the sexual impulse shows a greater range of variation in women than in men, both as between woman and woman and in the same woman at different periods.

It may be added that a proper understanding of these sexual differences in men and women is of great importance, both in the practical management of sexual hygiene and in the comprehension of those wider psychological characteristics by which women differ from men.

APPENDICES.

APPENDIX A.

THE SEXUAL INSTINCT IN SAVAGES.

I.

In the eighteenth century, when savage tribes in various parts of the world first began to be visited, extravagantly romantic views widely prevailed as to the simple and idyllic lives led by primitive peoples. During the greater part of the nineteenth century the tendency of opinion was to the opposite extreme, and it became usual to insist on the degraded and licentious morals of savages.[181]

In reality, however, savage life is just as little a prolonged debauch as a prolonged idyll. The inquiries of such writers as Westermarck, Frazer, and Crawley are tending to introduce a sounder conception of the actual, often highly complex, conditions of primitive life in its relations to the sexual instinct.

At the same time it is not difficult to account for the belief, widely spread during the nineteenth century, in the unbridled licentiousness of savages. In the first place, the doctrine of evolution inevitably created a prejudice in favor of such a view. It was assumed that modesty, chastity, and restraint were the finest and ultimate flowers of moral development; therefore at the beginnings of civilization we must needs expect to find the opposite of these things. Apart, however, from any mere prejudice of this kind, a superficial observation of the actual facts necessarily led to much misunderstanding. Just as the nakedness of many savage peoples led to the belief that they were lacking in modesty, although, as a matter of fact, modesty is more highly developed in savage life than in civilization,[182] so the absence of our European rules of sexual behavior among savages led to the conclusion that they were abandoned to debauchery. The widespread custom of lending the wife under certain circumstances was especially regarded as indicating gross licentiousness. Moreover, even when intercourse was found to be free before marriage, scarcely any investigator sought to ascertain what amount of sexual intercourse this freedom involved. It was not clearly understood that such freedom must by no means be necessarily assumed to involve very frequent intercourse. Again, it often happened that no clear distinction was made between peoples contaminated by association with civilization, and peoples not so contaminated. For instance, when prostitution is attributed to a savage people we must usually suppose either that a

mistake has been made or that the people in question have been degraded by intercourse with white peoples, for among unspoilt savages customs that can properly be called prostitution rarely prevail. Nor, indeed, would they be in harmony with the conditions of primitive life.

It has been seriously maintained that the chastity of savages, so far as it exists at all, is due to European civilization. It is doubtless true that this is the case with individual persons and tribes, but there is ample evidence from various parts of the world to show that this is by no means the rule. And, indeed, it may be said--with no disregard of the energy and sincerity of missionary efforts--that it could not be so. A new system of beliefs and practices, however excellent it may be in itself, can never possess the same stringent and unquestionable force as the system in which an individual and his ancestors have always lived, and which they have never doubted the validity of. That this is so we may have occasion to observe among ourselves. Christian teachers question the wisdom of bringing young people under free-thinking influence, because, although they do not deny the morals of free-thinkers, they believe that to unsettle the young may have a disastrous effect, not only on belief, but also on conduct. Yet this dangerously unsettling process has been applied by missionaries on a wholesale scale to races which in some respect are often little more than children. When, therefore, we are considering the chastity of savages we must not take into account those peoples which have been brought into close contact with Europeans.

In order to understand the sexual habits of savages generally there are two points which always have to be borne in mind as of the first importance: (1) the checks restraining sexual intercourse among savages, especially as regards time and season, are so numerous, and the sanctions upholding those checks so stringent, that sexual excess cannot prevail to the same extent as in civilization; (2) even in the absence of such checks, that difficulty of obtaining sexual erethism which has been noted as so common among savages, when not overcome by the stimulating influences prevailing at special times and seasons, and which is probably in large measure dependent on hard condition of life as well as an insensitive quality of nervous texture, still remains an important factor, tending to produce a natural chastity. There is a third consideration which, though from the present point of view subsidiary, is not without bearing on our conception of chastity among savages: the importance, even sacredness, of procreation is much more generally recognized by savage than by civilized peoples, and also a certain symbolic significance is frequently attached to human procreation as related to natural

fruitfulness generally; so that a primitive sexual orgy, instead of being a mere manifestation of licentiousness, may have a ritual significance, as a magical means of evoking the fruitfulness of fields and herds.[183]

When a savage practises extraconjugal sexual intercourse, the act is frequently not, as it has come to be conventionally regarded in civilization, an immorality or at least an illegitimate indulgence; it is a useful and entirely justifiable act, producing definite benefits, conducing alike to cosmic order and social order, although these benefits are not always such as we in civilization believe to be caused by the act. Thus, speaking of the northern tribes of central Australia, Spencer and Gillen remark: "It is very usual amongst all of the tribes to allow considerable license during the performance of certain of their ceremonies when a large number of natives, some of them coming often from distant parts, are gathered together--in fact, on such occasions all of the ordinary marital rules seem to be more or less set aside for the time being. Each day, in some tribes, one or more women are told off whose duty it is to attend at the corroboree grounds,--sometimes only during the day, sometimes at night,--and all of the men, except those who are fathers, elder and younger brothers, and sons, have access to them.... The idea is that the sexual intercourse assists in some way in the proper performance of the ceremony, causing everything to work smoothly and preventing the decorations from falling off."[184]

It is largely this sacred character of sexual intercourse--the fact that it is among the things that are at once "divine" and "impure," these two conceptions not being differentiated in primitive thought--which leads to the frequency with which in savage life a taboo is put upon its exercise. Robertson Smith added an appendix to his Religion of the Semites on "Taboo on the Intercourse of the Sexes." [185] Westermarck brought together evidence showing the frequency with which this and allied causes tended to the chastity of savages.[186] Frazer has very luminously expounded the whole primitive conception of sexual intercourse, and showed how it affected chastity.[187] Warriors must often be chaste; the men who go on any hunting or other expedition require to be chaste to be successful; the women left behind must be strictly chaste; sometimes even the whole of the people left behind, and for long periods, must be chaste in order to insure the success of the expedition. Hubert and Maus touched on the same point in their elaborate essay on sacrifice, pointing out how frequently sexual relationships are prohibited on the occasion of any ceremony whatever.[188] Crawley, in elaborating the primitive conception of taboo, has dealt fully with ritual and traditional influences making for chastity

among savages. He brings forward, for instance, a number of cases, from various parts of the world, in which intercourse has to be delayed for days, weeks, even months, after marriage. He considers that the sexual continence prevalent among savages is largely due to a belief in the enervating effects of coitus; so dangerous are the sexes to each other that, as he points out, even now sexual separation of the sexes commonly occurs.[189]

There are thus a great number of constantly recurring occasions in savage life when continence must be preserved, and when, it is firmly believed, terrible risks would be incurred by its violation--during war, after victory, after festivals, during mourning, on journeys, in hunting and fishing, in a vast number of agricultural and industrial occupations.

It might fairly be argued that the facility with which the savage places these checks on sexual intercourse itself bears witness to the weakness of the sexual impulse. Evidence of another order which seems to point to the undeveloped state of the sexual impulse among savages may be found in the comparatively undeveloped condition of their sexual organs, a condition not, indeed, by any means constant, but very frequently noted. As regards women, it has in many parts of the world been observed to be the rule, and the data which Ploss and Bartels have accumulated seem to me, on the whole, to point clearly in this direction.[190]

At another point, also, it may be remarked, the repulsion between the sexes and the restraints on intercourse may be associated with weak sexual impulse. It is not improbable that a certain horror of the sexual organs may be a natural feeling which is extinguished in the intoxication of desire, yet still has a physiological basis which renders the sexual organs--disguised and minimized by convention and by artistic representation--more or less disgusting in the absence of erotic emotion.[191] And this is probably more marked in cases in which the sexual instinct is constitutionally feeble. A lady who had no marked sexual desires, and who considered it well bred to be indifferent to such matters, on inspecting her sexual parts in a mirror for the first time in her life was shocked and disgusted at the sight. Certainly many women could record a similar experience on being first approached by a man, although artistic conventions present the male form with greater truth than the female. Moreover,--and here is the significant point,--this feeling is by no means restricted to the refined and cultured. "When working at Michelangelo," wrote a correspondent from Italy, "my upper gondolier used to see photographs and statuettes of all that man's works.

Stopping one day before the Night and Dawn of S. Lorenzo, sprawling naked women, he exclaimed: 'How hideous they are!' I pressed him to explain himself. He went on: 'The ugliest man naked is handsomer than the finest woman naked. Women have crooked legs, and their sexual organs stink. I only once saw a naked woman. It was in a brothel, when I was 18. The sight of her "natura" made me go out and vomit into the canal. You know I have been twice married, but I never saw either of my wives without clothing.' Of very rank cheese he said one day: 'Puzza come la natura d'una donna.'" This man, my correspondent added, was entirely normal and robust, but seemed to regard sexual congress as a mere evacuation, the sexual instinct apparently not being strong.

It seems possible that, if the sexual impulse had no existence, all men would regard women with this _horror feminae_. As things are, however, at all events in civilization, sexual emotions begin to develop even earlier, usually, than acquaintance with the organs of the other sex begins; so that this disgust is inhibited. If, however, among savages the sexual impulse is habitually weak, and only aroused to strength under the impetus of powerful stimuli, often acting periodically, then we should expect the _horror_ to be a factor of considerable importance.

The weakness of the physical sexual impulse among savages is reflected in the psychic sphere. Many writers have pointed out that love plays but a small part in their lives. They practise few endearments; they often only kiss children (Westermarck notes that sexual love is far less strong than parental love); love-poems are among some primitive peoples few (mostly originating with the women), and their literature often gives little or no attention to passion.[192] Affection and devotion are, however, often strong, especially in savage women.

It is not surprising that jealousy should often, though not by any means invariably, be absent, both among men and among women. Among savages this is doubtless a proof of the weakness of the sexual impulse. Spencer and Gillen note the comparative absence of jealousy in men among the Central Australian tribes they studied.[193] Negresses, it is said by a French army surgeon in his _Untrodden Fields of Anthropology_, do not know what jealousy is, and the first wife will even borrow money to buy the second wife. Among a much higher race, the women in a Korean household, it is said, live together happily, as an almost invariable rule, though it appears that this was not always the case among a polygamous people of European race, the Mormons.

The tendency of the sexual instinct in savages to periodicity, to seasonal manifestations, I do not discuss here, as I have dealt with it in the first volume of these *_Studies_*. [194] It has, however, a very important bearing on this subject. Periodicity of sexual manifestations is, indeed, less absolute in primitive man than in most animals, but it is still very often quite clearly marked. It is largely the occurrence of these violent occasional outbursts of the sexual instinct--during which the organic impulse to tumescence becomes so powerful that external stimuli are no longer necessary--that has led to the belief in the peculiar strength of the impulse in savages. [195]

FOOTNOTES:

[181] Thus, Lubbock (Lord Avebury), in the *_Origin of Civilization_*, fifth edition, 1889, brings forward a number of references in evidence of this belief. More recently Finck, in his *_Primitive Love and Love-stories_*, 1899, seeks to accumulate data in favor of the unbounded licentiousness of savages. He admits, however, that a view of the matter opposed to his own is now tending to prevail.

[182] See "The Evolution of Modesty" in the first volume of these *_Studies_*.

[183] The sacredness of sexual relations often applies also to individual marriage. Thus, Skeat, in his *_Malay Magic_*, shows that the bride and bridegroom are definitely recognized as sacred, in the same sense that the king is, and in Malay States the king is a very sacred person. See also, concerning the sacred character of coitus, whether individual or collective, A. Van Gennep, *_Rites de Passage_*, *passim*.

[185] *_Religion of the Semites_*, second edition, 1894, p. 454 *_et seq._*

[186] *_History of Marriage_*, pp. 66-70, 150-156, etc.

[187] *_Golden Bough_*, third edition, part ii, *_Taboo and the Perils of the Soul_*. Frazer has discussed taboo generally. For a shorter account of taboo, see art. "Taboo" by Northcote Thomas in *_Encyclopædia Britannica_*, eleventh edition, 1911. Freud has lately (*_Imago_*, 1912) made an attempt to explain the origin of taboo psychologically by comparing it to neurotic

obsessions. Taboo, Freud believes, has its origin in a forbidden act to perform which there is a strong unconscious tendency; an ambivalent attitude, that is, combining the opposite tendencies, is thus established. In this way Freud would account for the fact that tabooed persons and things are both sacred and unclean.

[191] This statement has been questioned. It should, however, be fairly evident that the sexual organs in either sex, when closely examined, can scarcely be regarded as beautiful except in the eyes of a person of the opposite sex who is in a condition of sexual excitement, and they are not always attractive even then. Moreover, it must be remembered that the snake-like aptitude of the penis to enter into a state of erection apart from the control of the will puts it in a different category from any other organ of the body, and could not fail to attract the attention of primitive peoples so easily alarmed by unusual manifestations. We find even in the early ages of Christianity that St. Augustine attached immense importance to this alarming aptitude of the penis as a sign of man's sinful and degenerate state.

[194] "The Phenomena of Sexual Periodicity." The subject has also been more recently discussed by Walter Heape, "The 'Sexual Season' of Mammals," *Quarterly Journal of Microscopical Science*, vol. xliv, 1900. See also F.H.A. Marshall, *The Physiology of Reproduction*, 1910.

[195] This view finds a belated supporter in Max Marcuse ("Geschlechtstrieb des Urmenschen," *Sexual-Probleme*, Oct., 1909), who, on grounds which I cannot regard as sound, seeks to maintain the belief that the sexual instinct is more highly developed among savage than among civilized peoples.

II.

The facts thus seem to indicate that among primitive peoples, while the magical, ceremonial, and traditional restraints on sexual intercourse are very numerous, very widespread, and nearly always very stringent, there is, underlying this prevalence of restraints on intercourse, a fundamental weakness of the sexual instinct, which craves less, and craves less frequently, than is the case among civilized peoples, but is liable to be powerfully manifested at special seasons. It is perfectly true that among savages, as Sutherland states, "there is no ideal which makes chastity a thing beautiful in itself"; but when the same writer goes on to state that "it is untrue that in sexual license the savage has everything to learn," we must demand greater precision of statement.[196] Travelers, and too often would-be scientific writers, have been so much impressed by the absence among savages of the civilized ideal of chastity, and by the frequent freedom of sexual intercourse, that they have not paused to inquire more carefully into the phenomena, or to put themselves at the primitive point of view, but have assumed that freedom here means all that it would mean in a European population.

In order to illustrate the actual circumstances of savage life in this respect from the scanty evidence furnished by the most careful observers, I have brought together from scattered sources a few statements concerning primitive peoples in very various parts of the world.[197]

Among the Andamanese, Portman, who knows them well, says that sexual desire is very moderate; in males it appears at the age of 18, but, as "their love for sport is greater than their passions, these are not gratified to any great extent till after marriage, which rarely takes place till a man is about 26." [198]

Although chastity is not esteemed by the Fuegians, and virginity is lost at a very early age, yet both men and women are extremely moderate in sexual indulgence.[199]

Among the Eskimo at the other end of the American continent, according to Dr. F. Cook, the sexual passions are suppressed during the long darkness

of winter, as also is the menstrual function usually, and the majority of the children are born nine months after the appearance of the sun.[200]

Among the Indians of North America it is the custom of many tribes to refrain from sexual intercourse during the whole period of lactation, as also D'Orbigny found to be the case among South American Indians, although suckling went on for over three years.[201] Many of the Indian tribes have now been rendered licentious by contact with civilization. In the primitive condition their customs were entirely different. Dr. Holder, who knows many tribes of North American Indians well, has dealt in some detail with this point. "Several of the virtues," he states, "and among them chastity, were more faithfully practised by the Indian race before the invasion from the East than these same virtues are practised by the white race of the present day.... The race is less salacious than either the negro or white race.... That the women of some tribes are now more careful of their virtue than the women of any other community whose history I know, I am fully convinced." [202] It is not only on the women that sexual abstinence is imposed. Among some branches of the Salish Indians of British Columbia a young widower must refrain from sexual intercourse for a year, and sometimes lives entirely apart during that period.[203]

In many parts of Polynesia, although the sexual impulse seems often to have been highly developed before the arrival of Europeans, it is very doubtful whether license, in the European sense, at all generally prevailed. The Marquesans, who have sometimes been regarded as peculiarly licentious, are especially mentioned by Foley as illustrating his statement that sexual erethism is with difficulty attained by primitive peoples except during sexual seasons.[204] Herman Melville's detailed account in *Typee* of the Marquesans (somewhat idealized, no doubt) reveals nothing that can fairly be called licentiousness. At Rotuma, J. Stanley Gardiner remarks, before the missionaries came sexual intercourse before marriage was free, but gross immorality and prostitution and adultery were unknown. Matters are much worse now.[205] The Maoris of New Zealand, in the old days, according to one who had lived among them, were more chaste than the English, and, though a chief might lend his wife to a friend as an honor, it would be very difficult to take her (*private communication*). [206] Captain Cook also represented these people as modest and virtuous.

Among the Papuans of New Guinea and Torres Straits, although intercourse before marriage is free, it is by no means unbridled, nor is it carried to excess. There are many circumstances restraining intercourse. Thus,

unmarried men must not indulge in it during October and November at Torres Straits. It is the general rule also that there should be no sexual intercourse during pregnancy, while a child is being suckled (which goes on for three or four years), or even until it can speak or walk.[207] In Astrolabe Bay, New Guinea, according to Vahness, a young couple must abstain from intercourse for several weeks after marriage, and to break this rule would be disgraceful.[208]

As regards Australia, Brough Smyth wrote: "Promiscuous intercourse between the sexes is not practised by the aborigines, and their laws on the subject, particularly those of New South Wales, are very strict. When at camp all the young unmarried men are stationed by themselves at the extreme end, while the married men, each with his family, occupy the center. No conversation is allowed between the single men and the girls or the married women. Infractions of these laws were visited by punishment; ... five or six warriors threw from a comparatively short distance several spears at him [the offender]. The man was often severely wounded and sometimes killed." [209] This author mentions that a black woman has been known to kill a white man who attempted to have intercourse with her by force. Yet both sexes have occasional sexual intercourse from an early age. After marriage, in various parts of Australia, there are numerous restraints on intercourse, which is forbidden not merely during menstruation, but during the latter part of pregnancy and for one moon after childbirth.[210]

Concerning the people of the Malay Peninsula, Hrolf Vaughan Stevens states: "The sexual impulse among the Belendas is only developed to a slight extent; they are not sensual, and the husband has intercourse with his wife not oftener than three times a month. The women also are not ardent.... The Orang Lâut are more sensual than the Dyaks, who are, however, more given to obscene jokes than their neighbors.... With the Belendas there is little or no love-play in sexual relations".[211] Skeat tells us also that among Malays in war-time strict chastity must be observed in a stockade, or the bullets of the garrison will lose their power.[212]

It is a common notion that the negro and negroid races of Africa are peculiarly prone to sexual indulgence. This notion is not supported by those who have had the most intimate knowledge of these peoples. It probably gained currency in part owing to the open and expansive temperament of the negro, and in part owing to the extremely sexual character of many African orgies and festivals, though those might quite

as legitimately be taken as evidence of difficulty in attaining sexual erethism.

A French army surgeon, speaking from knowledge of the black races in various French colonies, states in his Untrodden Fields of Anthropology that it is a mistake to imagine that the negress is very amorous. She is rather cold, and indifferent to the refinements of love, in which respects she is very unlike the mulatto. The white man is usually powerless to excite her, partly from his small penis, partly from his rapidity of emission; the black man, on account of his blunter nervous system, takes three times as long to reach emission as the white man. Among the Mohammedan peoples of West Africa, Daniell remarks, as well as in central and northern Africa, it is usual to suckle a child for two or more years. From the time when pregnancy becomes apparent to the end of weaning no intercourse takes place. It is believed that this would greatly endanger the infant, if not destroy it. This means that for every child the woman, at all events, must remain continent for about three years.[213] Sir H.H. Johnston, writing concerning the peoples of central Africa, remarks that the man also must remain chaste during these periods. Thus, among the Atonga the wife leaves her husband at the sixth month of pregnancy, and does not resume relations with him until five or six months after the birth of the child. If, in the interval, he has relations with any other woman, it is believed his wife will certainly die. "The negro is very rarely vicious," Johnston says, "after he has attained to the age of puberty. He is only more or less uxorious. The children are vicious, as they are among most races of mankind, the boys outrageously so. As regards the little girls over nearly the whole of British Central Africa, chastity before puberty is an unknown condition, except perhaps among the A-nyanja. Before a girl is become a woman it is a matter of absolute indifference what she does, and scarcely any girl remains a virgin after about 5 years of age." [214] Among the Bangala of the upper Congo a woman suckles her child for six to eighteen months and during all this period the husband has no intercourse with his wife, for that, it is believed, would kill the child.[215]

Among the Yoruba-speaking people of West Africa A.B. Ellis mentions that suckling lasts for three years, during the whole of which period the wife must not cohabit with her husband.[216]

Although chastity before marriage appears to be, as a rule, little regarded in Africa, this is not always so. In some parts of West Africa, a girl, at all events if of high birth, when found guilty of unchastity may

be punished by the insertion into her vagina of bird pepper, a kind of capsicum, beaten into a mass; this produces intense pain and such acute inflammation that the canal may even be obliterated.[217]

Among the Dahomey women there is no coitus during pregnancy nor during suckling, which lasts for nearly three years. The same is true among the Jekris and other tribes on the Niger, where it is believed that the milk would suffer if intercourse took place during lactation.[218]

In another part of Africa, among the Suaheli, even after marriage only incomplete coitus is at first allowed and there is no intercourse for a year after the child's birth.[219]

Farther south, among the Ba Wenda of north Transvaal, says the Rev. R. Wessmann, although the young men are permitted to "play" with the young girls before marriage, no sexual intercourse is allowed. If it is seen that a girl's labia are apart when she sits down on a stone, she is scolded, or even punished, as guilty of having had intercourse.[220]

Among the higher races in India the sexual instinct is very developed, and sexual intercourse has been cultivated as an art, perhaps more elaborately than anywhere else. Here, however, we are far removed from primitive conditions and among a people closely allied to the Europeans. Farther to the east, as among the Cambodians, strict chastity seems to prevail, and if we cross the Himalayas to the north we find ourselves among wild people to whom sexual license is unknown. Thus, among the Turcomans, even a few days after the marriage has been celebrated, the young couple are separated for an entire year.[221]

All the great organized religions have seized on this value of sexual abstinence, already consecrated by primitive magic and religion, and embodied it in their system. It was so in ancient Egypt. Thus, according to Diodorus, on the death of a king, the entire population of Egypt abstained from sexual intercourse for seventy-two days. The Persians, again, attached great value to sexual as to all other kinds of purity. Even involuntary seminal emissions were severely punishable. To lie with a menstruating woman, according to the Vendidad, was as serious a matter as to pollute holy fire, and to lie with a pregnant woman was to incur a penalty of 2000 strokes. Among the modern Parsees a man must not lie with his wife after she is four months and ten days pregnant. Mohammedanism cannot be described as an ascetic religion, yet long and frequent periods of sexual abstinence are enjoined. There must be no sexual intercourse

during the whole of pregnancy, during suckling, during menstruation (and for eight days before and after), nor during the thirty days of the Ramedan fast. Other times of sexual abstinence are also prescribed; thus among the Mohammedan Yezidis of Mardin in northern Mesopotamia there must be no sexual intercourse on Wednesdays or Fridays.[222]

In the early Christian Church many rules of sexual abstinence still prevailed, similar to those usual among savages, though not for such prolonged periods. In Egbert's Penitential, belonging to the ninth century, it is stated that a woman must abstain from intercourse with her husband three months after conception and for forty days after birth. There were a number of other occasions, including Lent, when a husband must not know his wife.[223] "Some canonists say," remarks Jeremy Taylor, "that the Church forbids a mutual congression of married pairs upon festival days.... The Council of Eliberis commanded abstinence from conjugal rights for three or four or seven days before the communion. Pope Liberius commanded the same during the whole time of Lent, supposing the fast is polluted by such congressions." [224]

III.

Thus it would seem probable that, contrary to a belief once widely prevalent, the sexual instinct has increased rather than diminished with the growth of civilization. This fact was clear to the insight of Lucretius, though it has often been lost sight of since.[225] Yet even observation of animals might have suggested the real bearing of the facts. The higher breeds of cattle, it is said, require the male more often than the inferior breeds.[226] Thorough-bred horses soon reach sexual maturity, and I understand that since pains have been taken to improve cart-horses the sexual instincts of the mares have become less trustworthy. There is certainly no doubt that in our domestic animals generally, which live

under what may be called civilized conditions, the sexual system and the sexual needs are more developed than in the wild species most closely related to them.[227] All observers seem to agree on this point, and it is sufficient to refer to the excellent summary of the question furnished by Heape in the study of "The 'Sexual Season' of Mammals," to which reference has already been made. He remarks, moreover, that, "while the sexual activity of domestic animals and of wild animals in captivity may be more frequently exhibited, it is not so violent as is shown by animals in the wild state." [228] So that, it would seem, the greater periodicity of the instinct in the wild state, alike in animals and in man, is associated with greater violence of the manifestations when they do appear. Certain rodents, such as the rat and the mouse, are well known to possess both great reproductive power and marked sexual proclivities. Heape suggests that this also is "due to the advantages derived from their intimate relations with the luxuries of civilization." Heape recognizes that, as regards reproductive power, the same development may be traced in man: "It would seem highly probable that the reproductive power of man has increased with civilization, precisely as it may be increased in the lower animals by domestication; that the effect of a regular supply of good food, together with all the other stimulating factors available and exercised in modern civilized communities, has resulted in such great activity of the generative organs, and so great an increase in the supply of the reproductive elements, that conception in the healthy human female may be said to be possible almost at any time during the reproductive period."

"People of sense and reflection are most apt to have violent and constant passions," wrote Mary Wollstonecraft, "and to be preyed on by them." [229] It is that fact which leads to the greater importance of sexual phenomena among the civilized as compared to savages. The conditions of civilization increase the sexual instinct, which consequently tends to be more intimately connected with moral feelings. Morality is bound up with the development of the sexual instinct. The more casual and periodic character of the impulse in animals, since it involves greater sexual indifference, tends to favor a loose tie between the sexes, and hence is not favorable to the development of morals as we understand morals. In man the ever-present impulse of sex, idealizing each sex to the other sex, draws men and women together and holds them together. Foolish and ignorant persons may deplore the full development which the sexual instinct has reached in civilized man; to a finer insight that development is seen to be indissolubly linked with all that is most poignant and most difficult, indeed, but also all that is best, in human life as we know it.

APPENDIX B.

THE DEVELOPMENT OF THE SEXUAL INSTINCT.

It is a very remarkable fact that, although for many years past serious attempts have been made to elucidate the psychology of sexual perversions, little or no endeavor has been made to study the development of the normal sexual emotions. Nearly every writer seems either to take for granted that he and his readers are so familiar with all the facts of normal sex psychology that any detailed statement is altogether uncalled for, or else he is content to write a few fragmentary remarks, mostly made up of miscellaneous extracts from anatomical, philosophical, and historical works.

Yet it is as unreasonable to take normal phenomena for granted here as in any other region of science. A knowledge of such phenomena is as necessary

here as physiology is to pathology or anatomy to surgery. So far from the facts of normal sex development, sex emotions, and sex needs being uniform and constant, as is assumed by those who consider their discussion unnecessary, the range of variation within fairly normal limits is immense, and it is impossible to meet with two individuals whose records are nearly identical.

There are two fundamental reasons why the endeavor should be made to obtain a broad basis of clear information on the subject. In the first place, the normal phenomena give the key to the abnormal phenomena, and the majority of sexual perversions, including even those that are most repulsive, are but exaggerations of instincts and emotions that are germinal in normal human beings. In the second place, we cannot even know what is normal until we are acquainted with the sexual life of a large number of healthy individuals. And until we know the limits of normal sexuality we are not in position to lay down any reasonable rules of sexual hygiene.

On these grounds I have for some time sought to obtain the sexual histories, and more especially the early histories, of men and women who, on prima facie grounds, may fairly be considered, or are at all events by themselves and others considered, ordinarily healthy and normal.

There are many difficulties about such a task, difficulties which are sufficiently obvious. There is, first of all, the natural reticence to reveal facts of so intimately personal a character. There is the prevailing ignorance and unintelligence which leads to the phenomena being obscure to the subject himself. When the first difficulty has been overcome, and the second is non-existent, there is still a lack of sufficiently strong motive to undertake the record, as well as a failure to realize the value of such records. I have, however, received a large number of such histories, for the most part offered spontaneously with permission to make such further inquiries as I thought desirable. Some of these histories are extremely interesting and instructive. In the present Appendix, and in a corresponding Appendix to the two following volumes of these Studies, I bring forward a varied selection of these narratives. In a few cases, it will be seen, the subjects are, to say the least, on the borderland of the abnormal, but they do not come before us as patients desiring treatment. They are playing their, usually active, sometimes even distinguished, part in the world, which knows nothing of their intimate histories.

HISTORY I.--E.T. (I reproduce this history, written in the third person, as it reached my hands.) T.'s earliest recollections of ideas of a sexual character are vaguely associated with thoughts upon whipping inflicted on companions by their parents, and sometimes upon his own person. About the age of 7 T. occasionally depicted to himself the appearance of the bare nates and genitalia of boys during flagellation. Reflection upon whipping gave rise to slight curious sensations at the base of the abdomen and in the nerves of the sexual system. The sight of a boy being whipped upon the bare nates caused erection before the age of 9. He cannot account for these excitations, as at the time he had not learned the most rudimentary facts of sex. The spectacle of the boy's nudity had no attraction for him, while the beating aroused his indignation against the person who administered it. T. knew a boy and girl of about his own age whose imaginations dwelt somewhat morbidly upon whipping. The three used to talk together about such chastisement, and the little girl liked to read "stories that had whippings in them." None of these children delighted in cruelty; the fascination in the theme of castigation seemed to be in imagining the spectacle of the exposed nates, though actual witnessing of the whipping made them angry at the time.

Accustomed to watch a young sister being bathed, T. had no distinct curiosity concerning the differences in sex until the age of 9. About this time he asked his father where babies came from, and was told to be quiet. When he persisted in the inquiry his father threatened to box his ears. His mother told him subsequently that doctors brought babies to mothers. He credited the story so far as to carefully watch the doctor who came when his mother "was going to have a new baby," in the hope of seeing a bundle in his arm. T. was 9 when he interrogated a servant-girl of 16 about babies and their origin. She laughed and said that one day she would tell him how children came. One Sunday this servant took T. for a country walk and initiated him in sexual intercourse, telling him he was too young to be a father, but that was the way babies were made. The girl took him into a field, saying she would show him how to do something which would make him "feel as though he was in heaven," informing him that she had often done this with young men. She then succeeded in causing erection and instructed him how to act. His feeling at the time was one of disgust; the appearance and odor of the

female genitalia repelled him. Afterward, however, he wished to repeat the experience with girls of his own age. Finding the boy unresponsive, the girl took the masculine position and embraced him with great passion. T. can recall the expression of the girl's face, the perspiration on her forehead, and the whispered query whether it pleased him. The embrace lasted for about ten minutes, when the girl said it had "done her good." Later the same day they met a girl cousin of this servant about 10 or 12 years old. The three went to a lonely part of the seashore. The servant there suggested that T. should repeat the act with the little girl. T. was too shy, though the girl seemed quite willing and experienced. The older girl told the younger to keep watch a few yards away, while she again brought about intercourse in the same way. The servant told T. not to tell anyone. Intercourse with the servant was never repeated after that day; from shame he kept the promise for many years.

After this episode T. began to speculate about sexual matters and to observe the coupling of dogs with newly acquired interest. At 10 years he often lay awake, listening to a woman of 25 singing to a piano accompaniment. The woman's voice seemed very beautiful, and so strongly impressed him that he fell in love with her and longed to embrace her sexually. This secret attachment was much more romantic than sensual, though the idea of embracing the woman seemed to T. a natural part of the romance. He was beginning to invest the sex with angelic qualities. The thought of his adventure with the servant no longer caused repulsion, but rather pleasure. He reflected that if he could meet the girl now he could be very fond of her and understand things better. At this time he had not masturbated, nor even heard of the practice. One day, while playing with a girl of his own age, he succeeded in overcoming her shyness and induced her to expose herself, at the same time uncovering his own sexual parts. On this occasion and once afterward he succeeded in penetrating the vulva. Both he and the girl experienced imperfect enjoyment.

At boarding-school, where he was sent at 10, T. learned the vulgar phrases for sexual organs and sexual acts, and acquired the habit of moderate masturbation. Coarse talk and indecent jests about the opposite sex were common amusements of the playroom and dormitories. At first the obscene conversation was

very distasteful; later he became more used to it, but thought it strange that sex intimacy should be a subject for ridicule and jest.

He began to read love-stories and think much about girls. At the same time he learned the nature of "the sin of fornication," and wondered why it should be considered so heinous. Parts of the Bible condemning intercourse between the unmarried alarmed him. Being of a serious as well as emotional and amorous nature, he became converted to evangelic belief. His mother warned him to beware of unclean companions at school. He tried to act as a Christian and think only pure thoughts about women. The talk, however, was always of girls and of being in love. His mind was often engrossed with amatory ideas of a poetic, sensuous nature, his sexual experiences having a firm hold on his imagination, while they gave him gratifying assurance of actual knowledge concerning things merely imagined by most of his companions.

His health was vigorous and he keenly enjoyed all outdoor games and excelled in daring and schoolboy mischief.

At 12 he fell deeply in love with a girl of corresponding age. He never felt any powerful sexual desire for his sweetheart, and never attempted anything but kissing and decorous caresses. He liked to walk and sit with the girl, to hold her hand, and stroke her soft hair. He felt real grief when separated from her. His thoughts of her were seldom sensual. A year or so afterward he had a temporary passion for a woman of 30, who used to flirt with him and allow kissing. T. thought her queen-like and very lovely, and wished to be her knight.

One day he saw, for a moment, in a friend's house, a dark, earnest-looking girl of 13, who made a very deep impression upon him, and, though he did not exchange a word with her, he often thought about her afterward. Five years later he met the dark girl again, and the pair were mutually drawn to one another. He proposed marriage and avowed a most desperate passion. A refusal on the plea of youth caused him the deepest misery. About eight years thereafter T. married the girl, and the marriage proved a very happy one for both.

When he was 15 T. made the acquaintance of a pretty blonde of the

same age. She was a high-spirited hoiden. They were soon close friends and later lovers. They wrote a number of letters to each other and exchanged locks of hair and presents. Their talk about love was unreserved. One day she told T. that she had been sexually embraced by a former lover, a boy of 16, hinting very plainly that she would like T. to embrace her. This amour lasted for about six months. The lovers had many opportunities for clandestine intercourse. They used to consummate their passion in a part of a wood they called "the bower." Now and then one or the other would experience a pricking of conscience, but they were too passionately attached to each other to sever the intimacy. At length the girl began to dread the risk of conception and the intercourse ceased. Looking back upon this episode T. avers that the attachment and its physical expression seemed quite natural, poetic, and beautiful, though at times his religious principles condemned his conduct. He now thinks that the experience is by no means to be regretted either by the girl or himself. It was a wholesome youthful passion, as innocent as the mating of birds, and the insight which it gave to both of the hidden emotions of human nature was morally advantageous in after-life.

T. believes that his amative precocity was due to the early awakening of sex feeling by the servant-girl. But he also believes that the love passion would have asserted itself early in any case, since he inherits a warm temperament, had erectile power long before puberty, and has considerable seminal capacity. Having closely watched the effects of suppressed normal emotions and desires in youth at the time of pubescence, he maintains that such suppression is disastrous, causing unhealthy thoughts and leading to the formation of a habit of masturbation which may persist throughout life. He believes that temporary sexual intimacies between boys and girls under 20 from the period of puberty would be far less harmful than separation of the sexes until marriage, with its resultants: masturbation, hysteria, repressed and disordered functions in young women, seduction, prostitution, venereal affections, and many other evils.

HISTORY II.--The following narrative was written by a married lady: "My mother (herself a very passionate and attractive woman) recognized the difficulty for English girls of getting satisfactorily married, and determined, if possible, to shield us

from disappointment by turning our thoughts in a different direction. Theoretically the idea was perhaps good, but in practice it proved useless. The natural desires were there. Disappointment and disillusion followed their repression none the less surely for having altered their natural shape. I think the love I had for my mother was almost sexual, as to be with her was a keen pleasure, and to be long away from her an almost unendurable pain. She used to talk to us a good deal on all sorts of subjects, but she never troubled about education in the ordinary sense. When 9 years old I had been taught nothing except to read and write. She never forbade us to read anything, but if by accident we got hold of a book of which she did not approve she used to say: 'I think that is rather a silly story, don't you?' We were so eager to come up to her standard of taste that we at once imagined we thought it silly, too. In the same way she discouraged ideas about love or marriage, not by suggesting there was anything wrong or improper about them, but by implying great contempt for girls who thought about lovers, etc. Up to the age of about 20 I had a vague general impression that love was very well for ordinary women, but far beneath the dignity of a somewhat superior person like myself. To show how little it entered my thoughts I may add that, up to 17, I fancied a woman got a child by being kissed on the lips by a man. Hence all the fuss in novels about the kiss on the mouth.

"When I was 9 years old I began to feel a great craving for scientific knowledge. A Child's Guide to Science, which I discovered at a second-hand book-stall (and which, by the way, informed me that heat is due to a substance called caloric), became a constant companion. In order to learn about light and gravitation, I saved up my money and ordered (of all books) Newton's Principia, shedding bitter tears when I found I could not understand a word of it. At the same time I was horribly ashamed of this desire for knowledge. I got such books as I could surreptitiously and hid them in odd corners. Why, I cannot imagine, as no one would have objected, but, on the contrary, I should have been helped to suitable books.

"My sisters and I were all violently argumentative, but our quarrels were all on abstract subjects. We saw little of other children and made no friendships, preferring each other's society to that of outsiders. When I was about 10 a girl of the same age

came to stay with us for a few days. When we went to bed the first night she asked me if I ever played with myself, whereupon I took a great dislike to her. No sexual ideas or feelings were excited. When still quite a child, however, I had feelings of excitement which I now recognize as sexual. Such feelings always came to me in bed (at least I cannot remember them at any other time) and were generally accompanied by a gradually increasing desire to make water. For a long time I would not dare to get out of bed for fear of being scolded for staying awake, and only did so at last when actually compelled. In the mean time the sexual excitement increased also, and I believe I thought the latter was the result of the former, or, perhaps, rather, that both were the same thing. (This was when I was about 7 or 8 years old.) So far as I can recollect, the excitement did not recur when the desire to make water had been gratified. I seemed to remember wondering why thinking of certain things (I can't remember what these were) should make one want to urinate. (In later life I have found that, if the bladder is not emptied before coitus, pleasure is often more intense.) There were also feelings, which I now recognize as sexual, in connection with ideas of whipping.

"As a child and girl I had very strong religious feelings (I should have now if I could believe in the reality of religion), which were absent in my sisters. These feelings were much the same as I experienced later sexually; I felt toward God what I imagined I should like to feel to my husband if I married. This, I fancy, is what usually occurs. At 14 I went to a boarding-school where there were seventy girls between 7 and 19. I think it goes to show that there is but very little sexual precocity among English girls that during the three years I stayed there I never heard a word the strictest mother would have objected to. One or two of the older girls were occasionally a little sentimental, but on no occasion did I hear the physical side of things touched upon. I think this is partly due to the amount of exercise we took. When picturing my childhood I always see myself racing about, jumping walls, climbing trees. In France and Italy I have been struck by the greater sedateness of Continental children. Our idea of naughtiness consisted chiefly in having suppers in our bedrooms and sliding down the banisters after being sent to bed. The first gratified our natural appetite, while the second supplied the necessary thrill in the fear of being caught.

"I made no violent friendships with the other girls, but I became much attached to the French governess. She was 30, and a born teacher, very strict with all of us, and doubly so with me for fear of showing favoritism. But she was never unjust, and I was rather proud of her severity and took a certain pleasure in being punished by her, the punishment always taking the form of learning by heart, which I rather liked doing. So I had my thrill, excitement, I don't quite know what to call it, without any very great inconvenience to myself. Just before we left school the sexual instinct began to show itself in enthusiasm for art with a capital A, Ouida's novels being mainly responsible. My sister and I agreed that we would spend our lives traveling about France, Italy, and the Continent, generally *_à la Tricotrin_*, with a violin in one pocket and an *Atravante Dante* in the other. To do this satisfactorily to ourselves we must be artists, and I resolved to go in for music and become a second Liszt. When my father offered to take us to Italy, the artist's Mecca, for a couple of years, we were wild with delight. We went, and disillusionment began. It may perhaps seem absurd, but we suffered acutely that first summer. Our villa was quite on the beach, the lowest of its flight of steps being washed by the Mediterranean. At the back were grounds which seemed a paradise. Long alleys covered over with vines and carpeted with long grass and poppies, grassy slopes dotted with olives and ilex, roses everywhere, and almost every flower in profusion, with, at night, the fireflies and the heavy scents of syringa and orange blossoms. In the midst of every possible excitement to the senses there was one thing wanting, and we did not know what that was.

"We attributed our restlessness and dissatisfaction to the slow progress in our artistic education, and consoled ourselves by thinking when once we had mastered the technical difficulties we should feel all right. And of course we did derive a very real pleasure from all the beauties of art and nature with which Italy abounds.

"It seems to me, however, that the art craze is one of the modern phases of woman's sexual life. When we were in Italy the great centers of the country were simply overrun with girls studying art, most of whom had very little talent, but who had mistaken the restlessness due to the first awakening of the sexual

instinct for the divine flame of genius. In our case it did not matter, as we were not dependent upon our own exertions. But it must have been terribly hard for girls who had burned their boats and chosen art as a career, to have added to the repression of their natural desires the bitterness of knowing that in their chosen walk of life they were failures. The results as far as work goes might not be so bad if the passions, as in men, were occasionally gratified. It is the constant drudgery combined with the disappointment and finding that art alone does not satisfy which is so paralyzing. Besides, sexual gratification is always followed by exaltation of the mental faculties, with, in my experience, no depressing reaction such as follows pleasure excited by mental causes alone.

"At one time when living at the villa I met a man about 45, who took rather a fancy to me. I mention this because it woke me up; no emotion was excited, but I realized for the first time (I must have been nearly 20) that I was no longer a child, and that a man could think of me in connection with love. It was only after this, and not immediately after, either, that men's society began to have an interest for me, and that I began to think a man's love would be a pleasant thing to possess, after all.

"The sexual instinct, at any rate as regards consciousness, thus developed slowly and in what I believe to be a very usual sequence: religion, admiration for an older woman, and art. I am not sure that I have made quite enough of the first, yet I do not know that there is any more to say. There were very strong physical feelings connected with all these which were identical with those now connected with passion, but they were completely satisfied by the mental idea which excited them.

"The first time I can remember feeling keen physical pleasure was when I was between 7 and 8 years old. I can't recollect the cause, but I remember lying quite still in my little cot clasping the iron rails at the top. It may be said that this is hardly slow development, but I mean slow as regards (1) any connection of the idea with a man or (2) any physical means of excitation.

"I have laid stress on my desire for knowledge, as I think my sexual feelings were affected by it. A great part of my feeling for my mother was due to the stores of information she appeared

to possess. The omniscience of God was to me his most striking attribute. My French teacher's capacity was her chief attraction. When, as a girl, I thought of marriage, I desired a man who 'could explain things to me.' One learns later to live one's mental and sexual life separately to a great extent. But at 20 I could not have done so; given the opportunity, I should have made the mistake of Dorothea in Middlemarch.

"I have spoken of the depressing after-effects of pleasure brought about by a purely mental cause, but I do not think this is the case in childhood and early youth. (Perhaps some women feel no such depression afterward, and this may account for their coldness in regard to men.) This may perhaps be accounted for by the fact that it occurs much more rarely, and also it is perhaps a natural process before the sexual organs fully develop, and so not harmful.

"I always find it difficult in expressing the different degrees of physical excitement even to myself, though I know exactly what I felt. As a child, from the time of the early experience already mentioned (about the age of 7 or 8), and as a young girl, the second stage (secretion of mucus) was always reached. The amount of secretion has always been excessive, but at first secretion only lasted a short time; later it began to last for several hours, or even sometimes the whole night, if the natural gratification has been withheld for a long time (say, three months). I do not remember ever feeling the third stage (complete orgasm) until I saw the first man I fancied I cared for. I do not think that mental causes alone have ever produced more than the first two stages (general diffuse excitement and secretion). I have sometimes wondered whether I could produce the third mechanically, but I have a curious unreasonable repugnance to trying the experiment; it would seem to materialize it too much. As a child and a girl I was contented to arrive at the second stage, possibly because I did not realize that there was any other, and perhaps this is why I have experienced no evil results.

"In dreams the third stage seems to come suddenly without any leading up to it, either mental or physical, of which I am conscious. I do not, however, remember having any such dreams before I was engaged. They came at a later period; even then,

when great pleasure was experienced, it came, as a rule, suddenly and sharply, with no dreams leading up to it. The dreams generally take a sad form (an Evangeline and Gabriel business), where one vainly seeks the person who eludes one. I have, however, sometimes had pleasurable dreams of men who were quite indifferent to me and of whom I never thought when awake. The impression on waking is so strong one could almost fancy one's self really in love with them. I can quite understand falling in love with a person by dreaming of him in this way.

"The first time I remember experiencing the third stage in waking moments was at a picnic, when the man, to whom I have before referred as the first that I fancied I cared for, leaned against me accidentally in passing a plate or dish; but I was already in a violent state of excitement at being with him. There was no possibility of anything between us, as he was married. If he guessed my feelings, they were never admitted, as I did my best to hide them. I never experienced this, except at the touch of some one I loved. (I think the saying about the woman 'desiring the desire of the man' is just about as true as most epigrams. It is the man's personality alone which affects me. His feelings toward me are of--I was going to say--indifference, but at any rate quite secondary importance, and the gratification of my own vanity counts as nothing in such relations.)

"As a rule, to reach even the second stage the exciting ideas must be associated with some particular person, except in the case of a story, where one identifies one's self with one of the characters. In childhood and early youth it was, in the case of religion, the idea of God and the presence and the personality of God which aroused my feelings and always seemed very vivid to me. In the case of my governess, my feelings were aroused in exactly the same way as later they would be by one's lover. In the art craze I am rather vague as to how it came about, but I think, as a rule, there was rather a craving for pleasure than pleasure itself. I do not remember ever thinking much about the physical feeling. It seemed as natural that a pleasant emotion should produce pleasant physical effects as that a painful one should cause tears. As a child, one takes so much for granted, and later on my mind was so much occupied with worrying about the truth of religion that I hardly thought enough about anything else to analyze it carefully.

"I may summarize my own feelings thus: First, exciting ideas alone produce, as a rule, merely the first stage of sexual excitement. Second, the same ideas connected with a particular person will produce the second stage. Third, the same may be said of the presence of the beloved person. Fourth, actual contact appears necessary for the third stage. If the first stage only be reached, the sensation is not pleasurable in reality, or would not be but for its association. If produced, as I have sometimes found it to be, by a sense of mental incapacity, it is distinctly disagreeable, especially if one feels that the energy which might have been used in coping with the difficulty is being thus dissipated. If it be produced, as it may be, as the result of physical or mental restraint, it is also unpleasant unless the restraint were put upon one by a person one loves. Then, however, the second stage would probably be reached, but this would depend a good deal on one's mood. If the first stage only were reached, I think it would be disagreeable; it would mean a conflict between one's will and sexual feeling. Perhaps women who feel actual repugnance to the sexual act with a man they love have never gone beyond the first stage, when their dislike to it would be quite intelligible to me.

"Some time after the life in Italy had come to an end I became engaged. There was considerable difficulty in the way of marriage, but we saw a good deal of each other. My _fiancé_ often dined with us, and we met every day. The result of seeing him so frequently was that I was kept in a constant state of strong, but suppressed, sexual excitement. This was particularly the case when we met in the evening and wandered about the moonlit garden together. When this had gone on about three months I began to experience a sense of discomfort after each of his visits. The abdomen seemed to swell with a feeling of fullness and congestion; but, though these sensations were closely connected with the physical excitement, they were not sufficiently painful to cause me any alarm or make me endeavor to avoid their pleasurable cause. The symptoms got worse, however, and no longer passed off quickly as at first. The swelling increased; considerable pain and a dragged-down sensation resulted the moment I tried to walk even a short distance. I was troubled with constant indigestion, weight in the chest, pain in the head and eyes, and continual slight diarrhea. This went on for about

nine months, and then my _fiancé_ was called away from the neighborhood. After his departure I got a trifle better, but the symptoms remained, though in less acute form. A few months later the engagement was broken off, and for some weeks I was severely ill with influenza and was on my back for several weeks. When I could get about a little, though very weak, all the swelling was gone, but pain returned whenever I tried to walk or stand for long. The indigestion and diarrhea were also very troublesome. I was treated for both by a physician, but without success. Next year I became engaged to my husband and was shortly after married. The indigestion and diarrhea disappeared soon after. The pain and dragging feeling in the abdomen bothered me much in walking or any kind of exercise. One day I came across a medical work, _The Elements of Social Science_, in which I found descriptions of symptoms like those I suffered from ascribed to uterine disease. I again applied to a doctor, telling him I thought there was displacement and possibly congestion. He confirmed my opinion and told me to wear a pessary. He ascribed the displacement to the relaxing climate, and said he did not think I should ever get quite right again. After the pessary had been placed in position every trace of pain, etc., left me. A year later I thought I would try and do without the pessary, and to my great satisfaction none of the old trials came back after its removal, in spite of much trouble, anxiety, sick nursing, and fatigue. I attribute the disorder entirely to violent sexual excitement which was not permitted its natural gratification and relief.

"I have reason to believe that suppression acts very injuriously on a woman's mental capacity. When excitement is naturally relieved the mind turns of its own accord to another subject, but when suppressed it is unable to do this. Personally, in the latter event, I find the greatest difficulty in concentrating my thoughts, and mental effort becomes painful. Other women have complained to me of the same difficulty. I have tried mechanical mental work, such as solving arithmetical or algebraic problems, but it does no good; in fact, it seems only to increase the excitement. (I may remark here that my feelings are always very strong not only before and after the monthly period, but also during the time itself; very unfortunately, as, of course, they cannot then be gratified. This only applies to desire from within, as I am strongly susceptible to influences from without

at any time.) There seems nothing to be done but to bow to the storm till it passes over. Anything I do during the time it lasts, even household work, is badly done. The brain seems to become addled for the time being, while after gratification of desire it seems to attain an additional quickness and cleverness. Perhaps this cause contributes to the small amount of intellectual and artistic work done by women, admitting their natural inferiority to men in artistic impulse. A woman whose passions are satisfied generally has her strength sapped by maternity, while her attention is drawn from abstract ideas to her children."

HISTORY III.--B. states that his first sexual thoughts and acts were curiously connected with whipping. At 12 he and another boy used to beat each other with a cricket bat upon the bare nates, and afterward indulge in mutual masturbation. He cannot remember the beginning of his sexual speculation as a child, nor how he learned masturbation. When he was 13 he used to discuss erotic matters with a schoolfellow who was in the habit of engaging in vulvar intercourse with a girl of his own age. The intercourse was practised on the way home from school, and in a standing posture. B. embraced the girl in the same way. He is not interested in the psychological aspects of the sexual emotion. Although his sex passion was early kindled, he never had commerce with prostitutes. He thinks that his youthful experiences had no ill effect upon him morally, mentally, or physically. He practised masturbation in moderation till he married, at the age of 31.

HISTORY IV.--"I can remember" (writes the subject) "trotting away as a youngster about 5 with another boy to 'see a girl's legs'; the idea emanated from the other boy, but I was vaguely interested. How or where we were going to see the object in question I do not remember nor anything further than the intention. When 6 or 7 I remember being put to bed with the nurse girl and feeling her bare arm with undoubted sexual excitement; I remember, too, gradually feeling along the arm very cautiously, fearing the girl would wake and being bitterly disappointed to find it was merely the arm. I am almost certain I had then no idea of sex, but the disappointment was actual.

"These are the only early experiences of the sort I can remember. When about 9 I had others. On the coast of the north of England, which had then very few visitors and seemed to me very remote, I lived in a farm-house and used to assist the girls of the farm in looking after young cattle. These girls certainly instilled sexual ideas, though I did not realize them with precision. They used to talk about things a good many of which, I can now see, I did not then understand as they did. I liked to see these girls wading with their dresses tucked up. About this time I fell passionately in love with a girl cousin, but do not remember having any sensual ideas in regard to her. I cannot say that these early experiences had any influence on my later sexual development so far as I am consciously aware. I have always remembered them vaguely, never with sexual excitement.

"Sexual dreams took place first at about the age of 13; there was then emission and sensation in sleep. These were, however, not much associated with distinctly sexual dreams. All that I recall after them was the sensation, which, however, I did not even then absolutely localize. Masturbation was undoubtedly the direct result of these dreams. It was tried at first tentatively, out of curiosity to determine if the sensation of the dream could be so reproduced. Sexual dreams, such as I have described, occurred frequently, although I cannot say at what interval. I have never experienced the slightest attraction for the same sex."

HISTORY V.--"My maternal grandfather" (writes the subject of this history) "was a small farmer who kept a few beagles and greyhounds for hare-hunting. He had three daughters, one of whom became my mother. One of his sporting companions, a doctor of profligate habits and a drunkard, seduced my mother at the age of 20. When her condition was discovered she had to flee from the violence of her father, and I was born some distance from her home. After my grandfather's death I was reared by my grandmother, and saw nothing of my mother until I was nearly 16; she had left the country in shame and disgrace.

"I believe that in my heredity the transmission comes chiefly from my mother, who is now 58 years old. Although her life has been blameless in every particular since her youthful

indiscretion, she has never got over it. I feel in my character a reflection of her overstrung condition during pregnancy.

"I can distinctly remember from the age of 9 years, and am sure that I had no sexual feelings before the age of 13, though always in the company of girls. I had many boyish passions for girls, always older than myself, but these were never accompanied by sexual desires. I deified all my sweethearts, and was satisfied if I got a flower, a handkerchief, or even a shred of clothing of my inamorata for the time being. These things gave me a strange idealistic emotion, but caused no sexual desire or erection.

"At 13 a 26-year-old sister of a boy companion once sat down on a sheaf of corn so as to expose the mons veneris and enticed me to copulate. There was slight erection, and after the act had been continued some time a pleasurable sensation of ejaculation, but without true emission. I had frequent relations with this woman after that.

"About this time the farm servant of a neighbor taught me masturbation. The mistress of the farm, a thin, willowy, dark woman, the mother of several children, treated me with such familiarity as once to urinate in my presence, so that I saw her very hirsute mons veneris. From that moment I conceived a great passion for her, and used to tremble as soon as I saw her. I had become well developed and virile, but, though I think she was a lustful woman, I never ventured to touch her. I found an extreme ecstasy in masturbating while gazing upon some article of her clothing. This gave me much greater sexual pleasure than actual connection with the ever-willing sister of my schoolfellow. I think I loved the married woman best because the mons veneris was more covered with hair.

"This has always had a peculiar attraction for me. Later, when accosted by prostitutes, I never would go with them unless I was assured the mons veneris was very hirsute. Never much addicted to masturbation, I derived no great enjoyment therefrom unless I had hair or part of the clothing of the woman with whom I was indulging in psychic coitus.

"At 16 I left school and went to a large city to learn a business. At this time the sexual appetite was very strong. I

frequently had intercourse with three women in one evening.

"I have had but few lascivious dreams. In these the phantom partner was almost invariably a dead woman. (When about 8 I had seen the dead body of an aunt who died at 24.)

"When 20 I went to London and took all the pleasure which came my way. I cared only for normal coitus. Offers of another type created disgust. I once allowed a woman to exhaust me sexually orally, but felt degraded thereby. Women with whom I had become very intimate often urged me to cunnilingus, but I could not do it. I have practised intermammary coitus a very few times.

"At 26 I married a pure, gentle woman, after having for ten months before marriage led a life of celibacy. My wife died when I was 30, and for about eight months I lived a celibate life. Lascivious dreams sometimes occurred, but I invariably awoke before ejaculation. Eventually I gave way to the cravings of my strong sexual nature, but never wished for anything out of the usual except intercourse from behind. A woman with marked development of the nates has great attraction for me. Solitary masturbation has for some time ceased, but a nude woman in the act of masturbation with her back to me gives me great pleasure. I am as strong sexually at 38 as I was at 20, only I never want women unless I am brought into actual contact with them and they are hairy and have large pelvic development. I am in excellent health. Genitals are well developed, and I am clothed with hair from the chin to the genitals. My skull is dolichocephalic. I am violent and tenacious in temper, high-strung, and rapid in thought and action. My digestion is good, but I have a tendency to constipation. Occasionally I have a twinge of pain below the occipital region.

"My early views of women have changed; I no longer deify them, though I study them. I have known very sensual women living at home in respectable middle-class society. One, in particular, a girl of 18, after coitus used to excite me lingually. I have had a sweetheart who remained virgo intacta. Had I seduced her, as I could have done, I should have lost all interest in her. I could never bear the presence of naked men, and would never go to a public swimming bath for that reason. I regard myself as a man of abnormally strong, but, on the whole, healthy and wholesome,

sexual feelings. As a rule, I have coitus twice or oftener in one week and I practise withdrawal. I am a total abstainer, and never could embrace a woman who smelled of drink."

HISTORY VI.--The writer of the following is a man of letters, married. "Quite early I remember a strange and romantic interest in the feminine. Certainly before I was 9 I had a strong affection for a little girl playmate; our family lost sight of hers, and I saw and heard nothing of her for sixteen years; then, hearing she was coming to town, I experienced quite a flutter of heart, so strong had been the impression caused at even the early age of our acquaintance. Not that I mean to say I never wavered in between! Through the whole of my boyhood I remember persistent romantic interests in girls and women, whose smooth, fair faces and sweet voices exercised ever a subtle attraction over me. Before I was 12 I had picked out my 'future wife' a dozen times at least! (A different one each time of course!) Curiosity as to the physical detail of sex and birth was singularly absent. Possibly this was partly due to the fact that the only younger member of our family was born when I was but 4 years old. Grave, shy, and reserved, I was never taken into the counsels of prurient schoolmates. I was unaware that there was such discussion between them--though it is, I suppose, not probable that our school was exempt. I was a great reader, and when about 12 or 13 I came across a reference to an illegitimate child which puzzled me. Ere long, however, in my random and extensive reading I hit on a book that touched on phallicism, and I learned that there were male and female organs of generation. I had neither shame nor curiosity; I jumped to the conclusion that during close caresses somehow a subtle aroma arose from the man to fertilize the woman; I left the subject at this, satisfied, and had no inkling of the real intimacy of the embrace.

"About 14, much interested in Bradlaugh, I bought both the Knowlton pamphlet and Mrs. Besant's population book. I found the physical details in scientific language so dull that I could not peruse them. By reading the argumentative passages I learned that _somehow_ (I knew not how) children could be produced or not produced as desired; and in this stage of the matter it seemed to me so admirable that it should be so that I wondered why there should be cavil.

"About this age my elder brother believed it to be his duty to tell me the secrets of sex; I remember his talking to me, while I, bored and uninterested, thought of something else. When he finished I had heard nothing. Remember, I felt no shame on the matter--none at all. I was simply bored. This I attribute to two things: first, my preponderating interest in the romantic side of things; secondly (and this bears with it a strong moral), _the feeling that the knowledge lay always within my grasp kept me from that curiosity which so oft consumes those who think it is hidden away from them_.

"The changes of puberty came naturally and without startling me. Even the fact of emissions--which took place during sleep at intervals, unaccompanied by dreams or by any physical prostration afterward--has left on my memory no recollection of surprise; I knew it to be somehow connected with generation, but I had no physical trouble, and I am quite sure I did not bother further about it. The best possible proof of this lies in the fact that my memory is a blank on the matter. At the age of 21 (I take this from a diary, so I know it is correct) I was still ignorant as to intrinsic fact. Then I pulled myself together and felt it was really time I learned the actual details of the matter. I went to a clever friend of mine and asked him to tell me all about it. He expressed himself astounded at my not knowing; and he had very great shyness about telling me. In fact, I had to drag facts out of him by a real cross-examination, during which he persistently marveled at my ignorance. Though he had a great deal of false shame about the matter, I had none at all. His revelations considerably surprised me, because I had no idea that there was actual intromission. When I came to reflect on what I had learned the fact of this close physical intimacy appealed to me as being quite poetic and beautiful between two lovers; and I have had no reason since to change my opinion.

"_Summary._--1. Romantic interest in girls and women commencing early and remaining persistently.

"2. Knowledge before puberty of the fact that this interest was based on the all-important process of reproduction.

"3. Absence of further physical curiosity even at puberty itself.

"4. Knowledge ultimately acquired without shock.

"The physical in sex has never been any bother to me, neither have I bothered about it. I have recognized it, frankly, and don't see why I shouldn't, but my unashamed recognition has probably been because the merely physical is less absorbing to me than to most. Mental and emotional interest in passion has absorbed me greatly, but the merely physical has sunk into what I call its natural place of subordination. Nature is kind. It is our 'conspiracy of silence' which tends to emphasize physical detail."

HISTORY VII.--G.D., who is a doctor and a man of science, writes: "There is a strong history of gout on the paternal side. No history of alcohol, tubercle, brain trouble, or of the arthropathies. There is some reason to believe that two of my maternal aunts were sexually frigid, and perhaps this was true to a less extent of my mother, who had a contracted pelvis, necessitating the induction of labor at the eighth month of pregnancy.

"About the age of 7 a German nursery governess, B., took charge of me, and I soon became devoted to her. I was then a delicate child, and used to suffer frequently from nightmare, waking up screaming and covered with sweat. When this happened, B. would sometimes take me into her bed and soothe me with kisses, etc. These I returned, and can remember that I was particularly fond of kissing her breasts.

"About this time a girl cousin, A., about a year older than myself, was one of my most frequent playmates. I endeavored to monopolize her company and attention, and on this account often came to blows with C., a cousin rather younger than myself, who has since told me that he was then 'in love' with A. and 'jealous' of me. I believe I was really jealous and in love at the time, but cannot remember that anything in the nature of caresses took place between A. and myself.

"Some time later, probably when I was about 9, something led up to B. saying that she was not built like I was, that she had no penis, etc. (I cannot remember my nursery term for penis.) I was

incredulous, and demanded to be allowed to see if it was true; this was refused, and I made many plans to gratify my curiosity, such as slipping into her room when she was dressing, tipping up the chair she was sitting in, and trying to suddenly thrust my hand up under her skirts. I did not succeed in finding out, but have since thought that, although she did not allow me to attain the object of my efforts, the later game caused her pleasurable sensations. I regard these efforts as being prompted purely by curiosity; I had no feelings of warmth or irritations of the genitals, and I certainly never manipulated them, nor was I, as far as I can judge, an unusually prurient small boy. B. left when I was about 10, when I went to a preparatory school.

"At 12½ I was sent to a public school, and was then told by my father the chief facts of sex and warned to avoid masturbation. My first wet dream took place when I was 14. Rather before this I had begun to suffer with severe intermittent testicular neuralgia which practically defied all treatment and continued on and off for four or five years, the attacks gradually becoming fewer and less severe.

"When 15, circumstances compelled me to leave school and to live for two years at the seaside with no companions of my own age. I had, however, the run of a well-stocked library, and fished and collected insects energetically.

"At 16 I made love to the trained nurse attending my mother, but, owing more, I think, to my timidity than to the austerity of her virtue, got no further than kissing. About this time wet dreams became inconveniently frequent; they would occur three or four times weekly, and resisted the stock remedies. At 17 I was advised to try connection. This I did, and found but little pleasure in the act, there being a strong esthetic objection to the 'love that keeps awake for lure.'

"About this time I found in the United States Pharmacopoeia a remedy for my emissions, which have, however, always remained rather more frequent than those of the average individual, judging from the experience of my friends. Emissions are generally accompanied by lascivious dreams, but at times take place when I dream that I am hurrying to catch a train, or to micturate against time.

"I have of late years (not noticed till after 20) observed that the dream accompanying emission is shorter; so that, whereas up to, say, 21 I generally performed the whole physiological act with my dream-charmer, I now almost invariably emit and awake before intromission has taken place. There has been no alternation comparable to this in the performance of the act while I am awake.

"As regards my physique I should mention that all my reflexes are very brisk, though I am only slightly ticklish in the ordinary sense of the term. I sweat easily and am very shy, not only with women, but with any strangers. I have, however, trained myself not to show this. About averagely passionate, I should say, and extremely critical where women are concerned, the latter quality often keeping me chaste for months at a time."

HISTORY VIII.--"When I was about 8 years old" (states the lady who is the subject of the present observation) "I remember that, with several other children, we used to play in an old garden at being father and mother, unfastening our drawers and bringing the sexual parts together, as we imagined married people to do, but no sexual feelings were aroused, nor did the boys have erections." When about 10 years old she became conscious of a pleasurable sensation associated with the smell of leather, which has ever since persisted. At that age she was sometimes left to wait in the office of a wholesale business house full of leather-bound ledgers. She did not then notice the sensation particularly, and was certainly not conscious of any connection with sexual emotion. Menstruation was established at 13½ years. Distinct sexual feelings were first observed a few months later. "The first feelings of love which I ever felt were at the age of 14 for a nice, manly boy of my own age, who often came to our house. He liked me, but was not in love with me. It was very seldom that he would sit by me and hold my hand, as I wished him. This went on till I was about 17, when he went to the university. After his first term he came back and was then attracted to me; but, though I loved him very much, I was too proud to show it. When he tried to kiss me, I resisted, though I longed for it. Thinking I was greatly offended, he apologized, which only made me angry. All these years I was worshiping at his shrine and

mixed him up with all my ideas of life." Whenever she was near him she experienced physical sensations, with moistening of the vulva. This continued till she was about 20, but the object of these emotions never again attempted any advances.

At 19 she became engaged to someone else. At the beginning she was physically indifferent to her lover, but when he first kissed her she became greatly excited. The engagement, however, was soon broken off from absence of strong affection on either side and chiefly, it would seem, from the cooling of the lover's ardor. She thinks he would have been more strongly attached to her if she had been colder to him, or pretended to be, instead of responding with simplicity and frankness.

During the next few years little occurred. She was working hard, and her amusements would mostly, she says, be regarded as rather childish. She was extremely fond of dancing, and she was always pleased when anyone paid her attention. She was frequently conscious of sexual feelings, sometimes tormented by them, and she regarded this as something to be ashamed of. The constant longing for love was affected little or not at all by hard work. "At about this time I was very fond of abandoning myself to day-dreams. I was very glad if I could get everyone out of the house and lie on an easy chair or the bed. I liked especially to read poetry, all the more if I did not quite understand it. This would lead me on to all sorts of dreams of love, which, however, never went beyond the preliminaries of actual love--as that was all I then knew of love." The only climax to her dream of love was founded on a piece of information volunteered by a married woman many years earlier, when she was about 12. This lady--evidently agreeing with Rousseau (who in Emile commended the mother's reply to the child's query whence babies come, "Les femmes les pissent, mon enfant, avec des grands douleurs") that the unknown should first be explained to the young in terms of the known--told her that the husband micturated into the wife. She therefore used to imagine a lover who would bear her away into a forest and do this on her as she lay at the foot of a tree. (At a later date she accidentally discovered that a full bladder tended to enhance sexual feelings, and occasionally resorted to this physical measure of heightening excitement.) All the physical sensations of sexual desire were called out by these day-dreams, with abundant secretion, but never the orgasm. Her

reveries never led to masturbation or to allied manifestations, which have never taken place. Such a method of relief has, indeed, never offered any temptation to her and she doubts even its possibility in her case. (At a later period of life, however, at the age of 31, masturbation began and was practised at intervals.) At the same time she remarks that, while no orgasm (of which, indeed, she was then ignorant) ever occurred, the sexual excitement produced by the day-dreams was sufficiently great to cause a feeling of relief afterward. These day-dreams were the only way in which the sexual erethism was discharged. She cannot recall having erotic dreams or any sexual manifestations during sleep.

Spontaneous sexual excitement was present a few days before menstruation, and fairly marked during and immediately after the period. It also tended to recur in the middle of the intermenstrual period.

The pleasurable sensation connected with the smell of leather became more marked as she approached adult age. It was especially pronounced about the age of 24, and the sexual emotion it produced (with moisture of the vulva) was then clearly conscious. No other odor produced this effect in such a marked degree. It was often associated with leather bags, but not with boots, though on rubbing the leather of shoes she found that this odor was given out. She cannot account for its origin, and does not connect any association with it. It never affected her conduct or led to fetichistic habits.

Some other odors affect her in the same way, though not to the same degree as leather. This is more especially the case with some flowers, especially white flowers with heavy odors, like gardenias. Many flowers, on the other hand, like primroses, seem rather opposed to sex effect, too fresh, though stimulating to the mind. Some artificial scents tend to produce sexual effects also. Personal odors have no influence of this kind. (At a later period the sexual influence of personal odors was occasionally experienced, but the present history deals only with the period before marriage.)

She believes that most beautiful things, however unconnected with sex, have a tendency to produce distinctively sexual feelings in

a faint degree, although sometimes more marked, with secretion. She has, however, never experienced homosexual feeling, and, on first consideration, was inclined to believe that the sight of a beautiful woman had no sexual effect on her, though she could quite understand such an effect. Subsequently, on recalling as well as observing her experiences more carefully, she found that a lovely woman's face and figure (especially on one occasion the very graceful figure of a beautiful fairy in a ballet) produced distinct sexual sensations (with mucous emission). Music, however, has strongly emotional effects upon her, and she cannot recall that she ever felt any equally powerful influence of this kind in the absence of music.

Looking back on the development of her feelings she finds that, though in some respects they may have been slow, they were simple, natural, spontaneous, and correspond to "the dawning and progress which go on in the development of every girl. While it is going on in actual fact, the girl does not know or bother herself about trying to understand it. Afterward it seems quite clear and simple. Full occupation of the brain, and hands too, while it does not do away with desire, is a great help and safeguard to a growing girl, when combined with proper information about herself and her relation to man the animal, so that she may realize where she is and how to choose the right man--though under the best conditions failure may occur."

HISTORY IX.--The subject belongs to a large family having some neurotic members; she spent her early life on a large farm. She is vigorous and energetic, has intellectual tastes, and is accustomed to think for herself, from unconventional standpoints, on many subjects. Her parents were very religious, and not, she thinks, of sensual temperament. Her own early life was free from associations of a sexual character, and she can recall little that now seems to be significant in this respect. She remembers that in childhood and for some time later she believed that children were born through the navel. Her activities went chiefly into humanitarian and utopian directions, and she cherished ideas of a large, healthy, free life, untrammelled by civilization. She regards herself as very passionate, but her sexual emotions appear to have developed very slowly and have been somewhat intellectualized. After reaching adult life she has formed several successive relationships with men to whom she has been

attracted by affinity in temperament, in intellectual views, and in tastes. These relationships have usually been followed by some degree of disillusion, and so have been dissolved. She does not believe in legal marriage, though under fitting circumstances she would much like to have a child.

She never masturbated until the age of 27. At that time a married friend told her that such a thing could be done. She found it gave her decided pleasure, indeed, more than coitus had ever given her except with one man. She has never practised it to excess, only at rare intervals, and is of the opinion that it is decidedly beneficial when thus moderately indulged in. She has sometimes found, for instance, that, after the mental excitement produced by delivering a lecture, sleep would be impossible if masturbation were not resorted to as a sedative to relieve the tension.

Spontaneous sexual excitement is strongest just before the monthly period.

Definite sexual dreams and sexual excitement during sleep have not occurred except possibly on one or two occasions.

She has from girlhood experienced erotic day-dreams, imagining love-stories of which she herself was the heroine; the climax of these stories has developed with her own developing knowledge of sexual matters.

She is not inverted, and has never been in love with a woman. She finds, however, that a beautiful woman is distinctly a sexual excitation, calling out definite physical manifestations of sexual emotion. She explains this by saying that she thinks she instinctively puts herself in the place of a man and feels as it seems to her a man would feel.

She finds that music excites the sexual emotions, as well as many scents, whether of flowers, the personal odor of the beloved person, or artificial perfumes.

HISTORY X.--The subject is of German extraction on both sides. The father is of marked intellectual tastes, as also is she herself. There is no unhealthy strain in the family so far as she

is aware, though they all have very strong passions. She is well developed, healthy, vigorous, and athletic, any trouble to which she is subject being mainly due to overwork.

Looking back on her childhood, she can now see various sexual manifestations occurring at a period when she was quite ignorant of sex matters. "The very first," she writes, "was at the age of 6. I remember once sitting astride a banister while my parents were waiting for me outside. I distinctly remember a pleasurable sensation--probably in part due to a physical feeling--in the thought of staying there when I knew I ought to have run out to them. From that year till the age of 10 I simply reveled in the idea of being tortured. I went gladly to bed every night to imagine myself a slave, chained, beaten, made to carry loads and do ignominious work. One of my imaginings, I remember, was that I was chained to a moldering skeleton." As she grew older these fancies were discontinued. At the same time there was a trace of sadistic tendency: "I used to frighten and tease a young child, driven to it by an irresistible impulse, and experiencing a certain pleasurable feeling in so doing. But this, I am glad to say, was rare, as I hate all cruelty."

One of her favorite imaginings as a child was that she was a boy, and especially that she was a knight rescuing damsels in distress. She was not fond of girls' occupations, and has always had a sort of chivalrous feeling toward women.

"When I first heard of the sexual act," she writes, "it appeared to me so absurd that I took little notice. About the age of 10 I discussed it a good deal with other girls, and we used to play childishly indecent games--out of pure mischief and not from any definite physical feeling."

About a year after menstruation was established she accidentally discovered the act of masturbation by leaning over a table. "I discovered it naturally; no one taught me; and the very naturalness of the impulse that led me to it often made me in later years question the harmfulness." Both her sisters masturbated from a very early age, but not, to her knowledge, her brother. The practice of masturbation was continued. "For many years, imbued with the old ideas of morality, I struggled against it in vain. The sight of animals copulating, the perusal of

various books (Shakespeare, Rabelais, Gautier's Mademoiselle de Maupin, etc.), the sight of the nude in some Bacchanalian pictures (such as Rubens's), all aroused passion. Coexistent with this--perhaps (though I doubt it) due to it--arose a disgust for normal intercourse. I fell in love and enjoyed kisses, etc., but the mere thought of anything beyond disgusted me. Had my lover suggested such a thing I would have lost all love for him. But all this time I went on masturbating, though as seldom as possible and without thought of my lover. Love was to me a thing ideal and quite apart from lust, and I still think that it is false to try to connect the two. I fear that even now, if I fell in love, sexual intercourse would break the charm. At the age of 18 I came across Tolstoy's Kreutzer Sonata and was overjoyed to find all I had thought written down there. Gradually, through seeing a friend happily married, I have grown to a more normal view of things. I am very critical of men and have never met one liberal-minded and just enough to please me. Perhaps if I did I might take a perfectly healthy view of things."

In course of time various devices had been adopted to heighten sexual excitement when indulging in masturbation. Thus, for instance, she found that the effects of sexual excitement are increased by keeping the bladder full. But the chief method which she had devised for heightening and prolonging the preliminary excitement consisted in wearing tight stays (as a rule, she wears loose stays) and in painting her face. She cannot herself explain this. Self-excitement is completed by friction, or sometimes by the introduction of a piece of wood into the vagina. She finds that, the more frequently she masturbates, the more easily she is excited. Spontaneous sexual feeling is strongest before and after the menstrual period; not so much so during the periods.

There are various faint traces of homosexuality, it may be gathered, in the history of this subject's sexual development. Recently these have come to a climax in the formation of a homosexual relationship with a girl friend. This relationship has given her great pleasure and satisfaction. She does not, however, regard herself as being a really inverted person.

There have been vivid sexual dreams from about 17 (apparently about the period of the relationship with the lover). These dreams have not, however, had special reference to persons of

either sex.

Apart from the influence of books and pictures already mentioned, she remarks that she is sexually affected by the personal odor of a beloved person, but is not consciously affected by any other odors.

HISTORY XI.--Widower, aged 40 years. Surgeon. "My experience of sexual matters began early. When I was about 10 years of age a boy friend who was staying with us told me that his sister made him uncover his person, with which she played and encouraged him to do the same for her. He said it was great fun, and suggested that we should take two of my sisters into an old barn and repeat his experience on them. This we did, and tried all we could to have connection with them; they were nothing loath and did all they could to help us, but nothing was effected and I experienced no pleasure in it.

"When I went back to school I attracted the attention of one of the big boys who slept in the same room with me; he came into my bed and began to play with my member, saying that it was the usual thing to do and would give me pleasure. I did not feel any pleasure, but I liked the attention, and rather enjoyed playing with his member, which was of large size, and surrounded by thick pubic hair. After I had played with him for some time I was surprised at his having an emission of sticky matter. Afterward he rubbed me again, saying that if I let him do it long enough he would produce the same substance from me. This he failed to do, however, though he rubbed me long and frequently, on that and many other occasions. I was very disappointed at not being able to have an emission, and on every occasion that offered I endeavored to excite myself to the extent of compassing this. I used to ask to go out of school two or three times a day, and retired to the closet, where I practised on myself most diligently, but to no purpose, at that time, though I began to have pleasurable emotions in the act.

"When I went home for the holidays I took a great interest in one of my father's maids, whose legs I felt as she ran upstairs one day. I was in great fear that she would complain of what I had done, but I was delighted to find that she did nothing of the

sort; on the contrary, she took to kissing and fondling me, calling me her sweetheart and saying that I was a forward boy. This encouraged me greatly, and I was not long in getting to more intimate relations with her. She called me into her room one day when we were alone in the house, she being in a half-dressed condition, and put me on the bed and laid herself on me, kissing me passionately on the mouth. She next unbuttoned my trousers and fondled and kissed my member, and directed my hand to her privates. I became very much excited and trembled violently, but was able to do for her what she wanted in the way of masturbation until she became wet. After this we had many meetings in which we embraced and she let me introduce my member until she had satisfied herself, though I was too young to have an emission.

"On return to school I practised mutual masturbation with several of my schoolfellows, and finally, at the age of 14 years, had my first real emission. I was greatly pleased thereat, and, with this and the growth of hair which began to show on my pubis, began to feel myself quite a man. I loved lying in the arms of another boy, pressing against his body, and fondling his person and being fondled by him in return. We always finished up with mutual masturbation. We never indulged in any unnatural connections.

"After leaving school I had no opportunity of indulging in relations with my own sex, and, indeed, did not wish for such, as I became a slave to the charms of the other sex, and passed most of my time in either enjoying, or planning to enjoy, love passages with them.

"The sight of a woman's limbs or bust, especially if partly hidden by pretty underclothing, and the more so if seen by stealth, was sufficient to give a lustful feeling and a violent erection, accompanied by palpitation of the heart and throbbing in the head.

"I had frequent coitus at the age of 17, as well as masturbating regularly. I liked to perform masturbation on a girl, even more than I liked having connection with her; and this was especially so in the case of girls who had never had masturbation practised on them before; I loved to see the look of surprised pleasure appear on their faces as they felt the delightful and novel

sensation.

"To gratify this desire I persuaded dozens of girls to allow me to take liberties with them, and it would surprise you to learn what a number of girls, many of them in good social position, permitted me the liberty I desired, though the supply was never equal to my demand.

"With a view to enlarging my opportunities I took up the study of medicine as a profession, and reveled in the chances it gave of being on intimate sexual terms with many who would have been, otherwise, out of my reach.

"At the age of 25 I married the daughter of an officer, a beautiful girl with a fully developed figure and an amorous disposition. While engaged, we used to pass hours wrapped in each other's arms, practising mutual masturbation, or I would kiss her passionately on the mouth, introducing my tongue into her mouth at intervals, with the invariable result that I had an emission and she went off into sighs and shivers. After marriage we practised all sorts of fancy coitus, *_coitus reservatus_*, etc., and rarely passed twenty-four hours without two conjunctions, until she got far on in the family way, and our play had to cease for a while.

"During this interval I went to stay at the house of an old schoolfellow, who had been one of my lovers of days gone by. It happened that on account of the number of guests staying in the house the bed accommodation was somewhat scanty, and I agreed to share my friend's bedroom. The sight of his naked body as he undressed gave rise to lustful feelings in me; and when he had turned out the light I stole across to his bed and got in beside him. He made no objection, and we passed the night in mutual masturbation and embraces, *_coitus inter femora_*, etc. I was surprised to find how much I preferred this state of affairs to coitus with my wife, and determined to enjoy the occasion to the full. We passed a fortnight together in the above fashion, and, though I afterward went back and did my duty by my wife, I never took the same pleasure in her again, and when she died, five years later, I felt no inclination to contract another marriage, but devoted myself heart and soul to my old school-friend, with whom I continued tender relations until his death by accident

last year. Since then I have lost all interest in life."

"The patient," writes the well-known alienist to whom I am indebted for the above history, "consulted me lately. I found him a fairly healthy man to look at, suffering from some neurasthenia and a tendency to melancholia. Generative organs large, one testicle shows some wasting, pubic hair abundant, form of body distinctly masculine; temperament neurotic. He improved under treatment, and, after seeing me three times and writing out the above history, came no more."

HISTORY XII.--Mrs. B., aged 32. Father's family normal; mother's family clever, eccentric, somewhat neuropathic. She is herself normal, good-looking, usually healthy, highly intelligent, and with much practical ability, though at some periods of life, and especially in childhood, she has shared to some extent in the high-strung and supersensitive temperament of her mother's family. As a child she was sometimes spoiled and sometimes cuffed, and suffered tortures from nervousness. She has, however, acquired a large measure of self-control.

The first sensations which she now recognizes as sexual were experienced at the age of 3, when her mother gave her an injection; afterward she declared herself unable to relieve her bowels naturally in order to obtain a repetition of this experience, which was several times repeated. At the age of 7 a man pursued her with attentions and attempted to take liberties, but she rejected his advances in terror; four years later another man attempted to assault her, but she resisted vigorously, struck him, and escaped by running. Neither of these sexual attempts appears to have left any serious permanent impression on the child's mind.

At the age of 11, when her mother was giving her a bath, the sensation of her mother's fingers touching her private parts gave her what she now knows to be sexual feelings, and a year later when taking her bath she would pour hot water on to the sexual region in order to cause these sensations; this did not lead to masturbation, but she had a vague idea that it was "wrong."

At the age of 12 menstruation began; she suffered very severely

from dysmenorrhea, the period sometimes lasting for ten days, and the pain being often extreme. She was not treated for this condition, her mother being of opinion that she would outgrow it. From the age of 14 or 15 until 23, or about the period of her marriage, she suffered from anemia.

She had little curiosity about sexual matters; her mother wished that she should always come to her for information about things she became acquainted with as to the general facts of sex; she did not, however, know definitely the facts of copulation until her marriage. She knew nothing of erection or semen, and thought that when a man and woman placed their organs together a child resulted. She hated talking about these subjects indecently, and would not listen to the sexual conversation of her schoolfellows. She never felt any homosexual attraction. Once another girl was much in love with her, but she despised and disliked her attentions; again, when a girl much older than herself, a friend of her mother's, slept with her and made advances, she repelled her and refused to sleep with her again.

She always got on well with men, and men were attracted to her. She was direct and sincere, without undue modesty. But she never allowed men to touch her or kiss her. She was a good dancer, and fond of dancing, but denies that it ever led to sexual feelings. She never felt any sexual attraction for a man until, at the age of 20, she fell in love with her future husband five years or more before marriage.

At this period she began to feel vague discomfort, which she knew to be localized near her sexual organs. She was aware, in a dim way, that it was connected with her love, and was of a sexual nature. But there was no definite idea of sexual intercourse. She felt nervous and depressed. If she had been asked to state what would relieve her, she could only have said B.'s presence and tenderness. A few days before he declared his love she experienced the nearest approach to sexual feeling she had ever had. It was summer and, with B. and some of her family, she had gone on a little expedition. One evening, in the train after a day's excursion, B. took her hand (unperceived by the others) and held it for some time. This aroused the strongest emotions in her; she closed her eyes, and, though she was not at the time aware that her sensations were localized in her sexual organs,

she thinks, in the light of subsequent knowledge, that she then experienced the orgasm.

During the engagement, which lasted between two and three years, circumstances prevented frequent meetings. B. would kiss her, suck her nipples, which became erect, and lie on her. She allowed him to take these liberties, feeling that if she refused him all satisfaction he might have relations with other women. She still felt no definite desire for contact of the sexual organs. She longed rather to be embraced and kissed, and to lie in her lover's arms all night. A few months before marriage, however, she masturbated occasionally, just before or just after menstruation, imagining, while doing it, that she was in her lover's arms. The act was usually followed by a sick feeling. Just before marriage she underwent an operation for the relief of the dysmenorrhea. She was somewhat shocked and sickened by the experiences of the wedding night. It seemed to her that her husband approached her with the violence of an animal, and there was some difficulty in effecting entrance. Coitus, though incomplete, took place some seven times on this first night. The bleeding from rupture of the hymen continued, so that for two days she had to wear a towel. For two months subsequently there was great pain during intercourse, although she suppressed the indications of this.

There were several children born of the marriage and for some years she lived happily, on the whole, with her husband, notwithstanding various hardships and difficulties and some incompatibility of temper.

As regards her sexual feelings she considers, from what other women have told her, that her feelings are, if anything, stronger than the average. The orgasm, however, was not fully developed until about five years after marriage. Sexual feeling is most pronounced before, during, and after the menstrual period, more especially before and about the third day (the period usually lasts from five to seven days). There is more sexual desire during pregnancy, especially toward the end, than at any other time. She never refused normal intercourse to her husband, but any abnormal or perverted method of sexual gratification is repellent. She was awakened one night about the third month of pregnancy by her husband inserting his penis _in ore_; the child

was born with palate defect and she is herself inclined to believe that this incident was the cause of the defect. Though she desires normal intercourse, she has seldom obtained complete gratification. For a long time she disliked seeing or touching the penis, and the feel, and especially the smell, of the semen produced nausea and even vomiting. (She has a very delicate sense of smell as well as of taste; though fond of the scent of flowers, no sexual feelings are thus aroused.) Withdrawal and the use of condoms are unsatisfactory to her, and mutual masturbation gives no relief and produces headache. Feelings of friendship for her husband have been most potent in arousing the sexual emotions, and she has had most pleasure in intercourse after a day spent in bicycling together. She has been for many months at a time without sexual intercourse, and during such periods has suffered much from pain in the head; this, however, she has now completely surmounted. She eventually discovered that her husband's abstinence from marital intercourse was due to infidelity. This led to a definite separation. She still occasionally experiences sexual desire, but has no inclination to masturbate. Her life is full and busy, affording ample scope for her energies and intelligence; moreover, she has her children to train and educate. She herself believes that her sexual life is at an end.

HISTORY XIII.--G.R., army officer. "I am 35 years of age. My parents married at the ages of 38 and 25, and my father is now 84 and my mother 71; both are particularly strong and healthy in body and mind. I am of old lineage on both sides, and know of no disease, defect, or abnormality among any of my ancestors or relations, except that my mother's family has a slight tendency to drink and excess, the present members of it all being considered eccentric. I have one brother and one sister living (brother unmarried, sister with several children) and am the youngest of a family of five. My brother is abnormal, but I don't know exactly in what way or from what cause. I have a strong suspicion that he masturbates to excess. My father is artistic and my mother musical. I have no aptitude for either, but appreciate both enormously, though not until about ten years ago. My principal reading is religion, science, and philosophy, with an occasional standard novel, or a modern novel of the 'improper' type by way of relaxation. I became a convinced and militant

rationalist about five years ago, but have been an unbeliever since I left school. I was anemic and threatened with bowel complaint at the age of 7, and was in consequence taken abroad for my health. I am now strong and vigorous, with great powers of endurance, and enjoy all forms of sport and exercise, particularly hunting, pig-sticking, and polo. I drink a lot, and am never fitter than when eating, drinking, and taking exercise in what most people would call excess. It takes more alcohol than I can hold to make me drunk when in England; but not so in the East. I have been told that I am very good-looking.

"When I was about 4 or 5 I was constantly chaffed by my older companions about putting my hand down my trousers and playing with my privates. I don't remember getting an erection, nor at what age this first occurred with me. At one time my brother and I used to play about with my sister's underclothing, and took great pleasure in it, but we never saw her genitals. She told us that on carefully examining herself one day she was glad to find that she had a small penis like boys had--doubtless the clitoris. When in France, at the age of 8 to 10, I began to notice the sexual parts of animals, and was very keen to know what mares kept between their hind legs. Later on I took great pleasure with another boy in feeling the teats of a she-ass, and, by myself, the penis of a donkey, as I had seen the French grooms do; but I took no interest in my own penis. I used to put my finger as far up the anus as it would go, and got a vague satisfaction from it. I went to a small private school at the age of 11, having been previously told by my mother of the manner of birth of men and animals, of which I was quite ignorant till then. She made no mention of the part taken by the father, and I never thought about it. Even then I was left with the impression that one was born through the navel. I was initiated at school, and used to handle the penis of the boy who told me. On several occasions I did _fellatio_ for him, and liked it, but he never offered to do the same for me, and I don't think he got much satisfaction out of it. Soon after this I became conscious of pleasurable sensations when lying on my stomach with an erection, and used occasionally to gratify myself that way, caring little for the school tradition that it was 'wicked' and bad for one. On one occasion, when talking at night with another boy, we compared our organs, both in erection, and I then for the first time thought of trying what I had heard vaguely mentioned, viz., two boys

playing at man and woman. I lay on him with my penis on his stomach and almost at once had an orgasm with emission, and experienced acute pleasure, though both he and I supposed that I had involuntarily micturated. I was 13 when this happened. I did it once more with him before I left, this time the other way up, so as to spare him the unpleasantness. I used to like kissing and hugging the smaller boys, and had a great eye for good looks. On going home for the holidays I masturbated with my hand out of curiosity to see what happened when the orgasm occurred, and then only did I fully understand the nature of the act. After this the rush and strangeness of a large public school distracted my attention, but I heard about wet dreams, masturbation, and homosexuality from the other boys, and soon became thoroughly initiated. I believe the tone of my house, if not of the whole school, was exceptionally bad; though it may only be that I saw more of it because I was attracted by it, and that other schools are the same really. Things involving certain expulsion if found out were done more or less in public, and I have myself openly got into bed with or masturbated other boys, and on more than one occasion have helped forcibly to masturbate small boys or to hold them while others had connection with them, the idea of the last two acts being that the boy would thereby be seduced and become available for, and willing to perform, homosexuality. Before I became big enough to have boys myself I masturbated frequently (on one occasion three times in the day), and invariably by lying on my stomach without the use of the hands. In having connection with other boys I used to do it between the thighs or on the stomach, and I never heard of any other way at that school.

Pædicatio would disgust me, and, moreover, would deprive me of the principal pleasure of intercourse, viz., the feeling of lying face to face and stomach to stomach. Of course, the satisfaction used to be mutual, but, though good-looking, I was never the passive party only, like some small boys who might be called professionals and whom I used to pay for their services. I went back after I had left and had a boy in the dark whom I had never seen before, having been told that he was all right. I used to have a very genuine affection for any party to my pleasure, though I took delight in torturing one in particular, but for what reason I cannot say. For one boy I developed a deep love, which lasted long after we had left school and had ceased all sexual connection. This love was as strong as anything I have ever felt since.

"I don't remember whether it was while I was at school or later that I first began again to take a sexual interest in animals. I used to masturbate a good deal and was always trying to find new ways of doing it and new substances to lie on. It was while feeling the vulva of a young mare that the brilliant thought struck me of trying to copulate with her, and thus getting the advantage of the soft vagina. It afforded me great satisfaction and I had an emission, though I did not then, nor at any other time with any other animal, succeed in penetrating properly. I afterward did the same with other mares and with a certain cow whenever I got a safe opportunity, which was not as often as I could have wished. I have not had connection with an animal for about ten years, but would have no objection to doing so, and feel sure I could perform the act properly now. After I left school at 17, I occasionally had longings for boys, but it was the exception and not the rule. I continued to masturbate, but not to excess, and used to make ineffectual efforts to stop it, but never succeeded for very long. When I was confirmed, at the age of 15, I became intensely religious, and was so remorseful at my first lapse from virtue that I burnt my leg with a red-hot poker, and I bear the scar still. On leaving school I went to Germany and there had my first coitus with a woman, a fat old German who gave me very little satisfaction. My next, a Jewess, gave me more than I asked for, in the shape of a soft chancre. In my ignorance I never had it treated, but it must have been very mild, for it disappeared of its own accord. When cramming in England I occasionally went home with a prostitute, but did not care much about them and could not afford good ones. On one occasion I was impotent. It may have been through drink, but it disgusted me with myself. I liked seeing the women naked, and always insisted that they should strip, especially the breasts, which I liked large and full. I had not learned to kiss on the lips, and had no desire to kiss the body, except the breasts, which I was generally too shy to do. But as I nearly always wore a condom and found penetration difficult I did not much enjoy the actual coitus. I am fully convinced that if women had been more accessible, if I had not thought myself bound to use preventives in self-defense, and if the act had not been looked upon with such disfavor by those in authority over me, I should have masturbated less or not at all, and would not have been tempted to bestiality. When I was 22 I had coitus with a girl who was not

a prostitute for the first time. I was violently excited and enjoyed it more than anything I had yet experienced, in spite of the facts that she would not undress and insisted on withdrawal before emission. On one other occasion only have I had coitus with a non-professional unmarried woman. Shortly after this I caught syphilis from a girl of the streets. I was circumcised and stayed in a private hospital for six weeks. It never went beyond the primary stage, and I have felt no ill effects from it, except that I have got a hydrocele in the right testicle. Of course, this incident necessitated the use of a condom on every occasion, and it greatly spoiled my pleasure. About this time a brother-officer older than myself made advances to me. He compared me to a Greek statue, and wanted to kiss me. I would have nothing to do with him, but was glad to have his confessions of homosexuality and somewhat surprised to learn that he was not alone in the regiment. I afterward fell in love with his sister, and he married and had children. He was bisexual in his inclinations, but was really in love with me for a short time.

"I had little to do with professionals until I went to South Africa, and though I was fond of ladies' society, and liked by ladies, I looked upon them as something apart, especially married women, and never attempted to take liberties with them; though I used to with shopgirls, etc., in my cramming days, and had often been in love. In South Africa I first began really to enjoy coitus, and on going to India continued to do so; in fact, I thought sexually of nothing else and rarely masturbated,--perhaps once in three weeks. I would go to brothels wherever they were available, Durban, Cape Town, Colombo, Calcutta, Bombay, and at one time preferred black women to white. I used to have horrible orgies with my brother-officers, and on one occasion I ordered six women to my bungalow in order to celebrate my birthday, and made a present of them to five of my friends after dinner. During this period, and until I went home, I rarely spoke to a lady, the chief exception being No. 1, a brother-officer's wife, with whom I began to be in love.

"Shortly after the South African War I fell violently in love with a young brother-officer, 'Z.' It amounted to a passion and I was forced to make overtures to him. He did not understand, being ignorant of homosexuality and quite virile, and would have nothing to do with me, though he was very nice about it. This

lasted for about a year, and then, thinking no doubt that he had better stop it, as I was really making myself very ridiculous and was mad with love, he threw me up altogether. I was intensely miserable for some time, and then I recovered and we made it up, and are now firm friends. I still want to kiss and stroke him when I see him naked, but would do nothing more. I went home by way of Japan after several years' absence from home, taking the women of the Eastern ports as I went, until I contracted gonorrhea in the Tokio Yoshiwara. I could not get rid of it, and arrived home in that state, having been deprived of the pleasure of trying several new races on the way in consequence. In England I rushed into a society which I had quit on such different terms, and it received me with open arms. I very soon began a flirtation with a married woman, and she completed my education in kissing which had been begun by the Japanese harlots. I was just coming to the point with this woman when I met No. 1 again, and my love for her was at once renewed. I told her so, but I knew that she did not return it. I then became attracted to No. 2, a girl older than myself, whom I had known all my life. I kissed her and fondled her breasts; but she would not allow anything else, until one night, when in the train with her, I got my hand down farther than she intended. It ended in my performing cunnilingus on her first, and then obtaining satisfaction between her thighs--a large step to take after the former limitations. Previous to this I had on several occasions obtained an emission, without meaning to, by lying on her fully dressed. She was aware of my disease, which by that time had become a gleet and did not inconvenience me in any way. From that time until I went back to India we went through the same performance whenever possible, I masturbating her sometimes with the finger, sometimes with the tongue, and having connection with various parts of her body, including the breasts, but always with a condom on account of my disease. She used to strip for my edification, and we frequently spent the night in the same bed. I was attracted to her mentally, but not very much physically; that is to say, that if circumstances had not thrown us together I should never have picked her out from other girls as being sexually attractive to me. I returned to India, and to No. 1, though I kept faithful to No. 2 in word and deed for five months, but gradually the overmastering influence of No. 1 reasserted itself over me. And then I met No. 3. We were attracted to each other at first acquaintance, and the attraction was mental and sexual. She was married and in love with another

man, but that did not prevent her from kissing me. I felt her breasts, masturbated her, and had emissions by lying on her, but she drew the line at one thing, viz., kissing on the lips; and I drew it at coitus. We arranged a trip together during which I went to bed with her, but never had coitus, though we both had frequent orgasms in other ways. Before starting on this trip I had thought that I should not see No. 1 again, and she let me kiss her, to my unspeakable joy. Circumstances, however, intervened, and I went straight to No. 1 after parting with No. 3, told her all I had done, and then kissed her again, leaving her just before her real lover, with whom she was then living, arrived. Later I returned again to No. 1, now in child to her lover. We lived together for three nights in spite of this. She then went home, and I had no connection with any woman for two years, except one black woman, being consumed with love and worship for No. 1. I was much in society, but never had any luck. At the end of this time I was traveling one night with a young officer ('X'), slight and effeminate and preferring men to women, with whom I had been until then on friendly but not intimate terms. I watched him undress and go to bed, and then, having myself undressed, went over to his bunk and put my hand under his clothes. He at once responded, and I got into his bed, both of us being in a frenzy of passion and surprise. But I was fairly sure of my ground or I would not have dared to take the risk. I used often to go to his bed after this, and on one occasion had coitus with a girl on a chair at a ball and the next night with my young officer. I scarcely knew the girl, and don't know her name now, but I took her measure, made her excited by manipulation and kissing, and then got her consent. I did not harm her, even if I had been the first, for orgasm occurred before I had penetrated beyond the lips. X surprised me by telling me that he had had connection with three other officers in my regiment, as well as with several others in the same station. He would not tell me their names, but I guessed easily enough. He used to drink heavily, and once I got into his bed when he was in a drunken stupor and he was quite unaware that I was there for some time. I myself was drinking too much at this time, and was frequently drunk before dinner. In the hot weather that followed I had one orgy in Bombay which lasted three nights. I started on a Greek and a Pole and finished up with a Japanese, two brother-officers accompanying me. Afterward I was much alone during the day in my bungalow, and used to become possessed by intense desire. I

masturbated occasionally, but by this time took but little pleasure in it, always craving for the moist human vagina. I had often heard, and myself quoted, the Pathan proverb 'Women for breeding; boys for pleasure; melons for delight,' and one day when seeking for some novelty with which to masturbate, and my eye being caught by a melon put ready for me to eat, it flashed across me to try whether the proverb was in any way true. I found it most satisfactory, and practised it several times after that, the pepita (papaye or pawpaw) being the nearest approach to the human vagina. The opportune arrival of a fairly good-looking punkah woman, however, put an end to this form of enjoyment by providing me with what I wanted. Soon afterward I went home again, taking the Japanese at Bombay on my way.

"I had kept up a correspondence with No. 1 all this time, but we had made a compact that whatever each did until we met again was not to count, and I knew that she had had at least one liaison since our parting, and was in entire ignorance of the state of her feelings toward me. Therefore, while trying to arrange a meeting with her, I took the first thing that chance threw in my way, thinking a bird in the hand better than the off chance of a better one in the bush. This was No. 4, with whom I spent three days at the seaside after having first had coitus with her in my own home while she was in the monthly state. Immediately on parting from her I came home to receive No. 1. The first time we were alone she kissed me, and this was followed by mutual confessions and coitus, though at first she said my affair was too recent. I agreed not to have connection again with No. 4, and kept to this until when staying in the same house again with her I was tempted beyond my powers; and I may add that she gave me no assistance in keeping this promise, of which she was fully cognizant. I at once wrote and confessed to No. 1, and she very naturally would have nothing more to do with me. But I managed to reconcile her, and we afterward lived together for three days in the country, as well as in London and in her own house. Meanwhile No. 5 had been making advances to me which I could not well refuse, being a very old friend. Nos. 4 and 5 were on one occasion staying together at my house, just after I had been faithless to No. 1 with No. 4. I could not very well sleep with them both, so at the earnest entreaty of No. 4 I went to her room first, told her my reasons for not having connection with her, left her in tears, and then went and slept with No. 5. This is

the only transaction I have ever concealed from No. 1; but No. 5 knows my whole story and accepts the situation of being only second so long as I give her satisfaction whenever possible. About this time I again met No. 3 and kissed and masturbated her in a cab, but she would not allow me to go home with her. At the bidding of No. 1 I now broke entirely with No. 4, to the great grief and astonishment of my sister, whose friend she was. Shortly after this I again returned to India, where I quarreled hopelessly with No. 1, and I don't know to this day what my fault was, except that she had got tired of me. Her influence over me is, however, too great to be so easily broken, and I would return to her tomorrow if she moved a finger in reconciliation. During the following hot weather I slowly but surely, albeit quite unconsciously, obtained an influence over No. 6, and it ended by her falling desperately in love with me and allowing me to do what I liked. I did not love her, and told her about No. 1, whose image always remained in the back of my vision, whatever I was doing. She also accepted the situation, and I don't think has any grievance against me. For my part I have nothing but thanks and gratitude and as much love as I am capable of to give her, and all the other women with whom I have had any sexual relations. The following is a short account of the above women:--

"No. 1. Had coitus before marriage, for love and with full knowledge of the nature of the act. Agreement with her husband not to have coitus rigidly adhered to by both. Has had connection with five other men since marriage. Very passionate, but faddy and particular. Slow at producing orgasm. Likes being in bed naked, and liked me once for having kissed her mons veneris. Thin, with undeveloped breasts. Brilliant, good-looking. Artistic and highly intellectual. Never masturbated, and did not know of homosexuality among women; very sensitive to touch on the pudenda.

"No. 2. Has had sexual relations, but never coitus, with many men. Mutually masturbated with one man. Masturbated herself frequently, and took a long time to produce orgasm, even with cunnilingus, which delighted her immensely. After having it performed, she would stoop down and passionately kiss my lips. Fond of prolonged kisses, during which the tongue played a prominent part. Tall and fully developed, but no looks. Clever, masculine brain, and strong physically. Skillfully concealed her

passionate nature, which, however, was long in developing and was long kept in check by maidenly modesty.

"No. 3. Innocent before marriage, and hated her _fiancé_ even to touch her, which feeling still persists. Has had liaisons with many men, and several miscarriages, one legitimate, others illegitimate, and one illegitimate child. Does not masturbate herself, but readily yields to its seduction when performed by others. The most passionate woman I have ever met. Good, typical, womanly figure, but thin and weak. Not much looks, but very fascinating to men. Clever and intellectual.

"No. 4. Coitus only with her husband before myself. Not very passionate. I know nothing about masturbation or homosexuality in her case. Very broad hips, large breasts, and well-developed nates. Deserted by her husband. No children. Rather foolish and weak-minded. Penetration difficult owing to long labia majora.

"No. 5. Knows all about homosexuality of both sexes and wants to know more about everything. Probably masturbates. Several children. In love with her husband at first, but now tired of him and took to other men for variety and because her husband had ceased to give her sexual pleasure. Very passionate; has slow orgasm; likes nakedness and contact of body. Very large vagina. Broad hips and full breasts. Intellectual, but not so by nature. Artistic and very musical.

"No. 6. Absolutely innocent before marriage. Was practically raped by her husband on her marriage night. This disgusted her with the whole performance, and she could not bear her husband's caresses. During pregnancy she was frightened because she did not know what was going to happen, i.e., how the child was going to be born; and no one enlightened her,--doctor, nurse, or mother. Did not know the meaning of the words sexual feeling, and never thought about sexual matters at all until marriage. I roused her passion, put things in their true light, made her have an orgasm, and told her what it meant. The orgasms at first made her cry and nearly faint, and she thereafter became intensely passionate. Very excited at cunnilingus, which I practised on her more than once. She confessed that the orgasm was stronger and more complete during coitus than during masturbation, which relieved my mind. She volunteered to strip naked and has but little

shyness with me. Cannot bear her husband yet. She admits that she was only half a woman before she knew me, but now regrets her marriage. Short, thin, and slight, with narrow hips and no breasts. Quick woman's wit, but not intellectual.

"Of the prostitutes I have known, perhaps 60 in number, the Japanese easily take the palm. They are scrupulously clean, have charming manners and beautiful bodies, and take an intelligent interest in the proceedings. Also they are not always thinking about the money. Perhaps the Kashmiris come next, though the Chinese run them very close. Some of the more expensive London women are bearable, but they are such harlots! The white women in the East are insupportable, and small wonder, for they consist of the dregs of the European and American markets. My list comprises English, French, German, Italian, Spanish-American, American, Bengali, Punjabi, Kashmiri, Kaffir, Singhalese, Tamil, Burmese, Malay, Japanese, Chinese, Greek, and Pole.

"I naturally prefer to satisfy myself with a woman, a friend and a lady of my own class; but in the absence of the best I gladly take the next best available, down the scale from a lady for whom I do not care to prostitutes of all classes and colors, men, boys, animals, melons, and masturbation. I would as cheerfully have connection with my sister, or any other female relative. I have frequent erotic dreams about the most extraordinary subjects--male and female relations, casual acquaintances of both sexes, and animals. When I have got an intrigue in hand with a woman, I have no wish to masturbate, and often restrain myself when I know that I am going to have access before long to prostitutes. After coitus it takes a long time before I am ready for the next, sometimes two hours; and the first is always very quick, nearly always too quick for the woman. With a strange woman I have difficulty in maintaining erection at the instant of penetration, and this has often given me trouble.

"I know that most women like, and few dislike, being touched by me. My favorite colors are green and red, and I can whistle quite well.

"I would be very glad to know whether I may be considered sexually normal or not, but I do not desire any opinion on the morality of my acts, for the simple reason that without knowing

all the circumstances it would be impossible to judge. But I cannot help saying that I do not consider anything I have done is wrong in itself, and I am quite certain that I have never harmed in any way any of the ladies with whom I have had relations. I am certain, if I had made promises which I knew I could not keep, I might have married one of them. But the result would have been great unhappiness to both, quarrels, and ultimate separation or divorce--and she realized that as well as I did. I may seem egotistical in my attitude and assurance toward ladies, but I only speak the honest truth; and I know that No. 6, for instance, has only gratitude and worship to give me for having opened her eyes. I have made her promise to have intercourse with her husband as soon as she can bear it, and I have satisfied myself that I have not started her on the road to sexual perversion. So much in self-explanation. I may add that I do not deliberately seek 'affaires de coeur,' and that, when they come my way, I do my utmost to use all consideration for the lady, thinking, as I do, that I owe them a far bigger debt than I shall ever be able to pay."

HISTORY XIV.--J.E., professional man, aged 32. Public school and university education, in which he did well. From age of 6 or 7 had strong sexual emotions, and from 9 sexually pleasurable dreams, though no emission till 12 or 13. He remembers the association of sexual excitement with whipping, either at sight or imagination of it, and this feeling was certainly shared by boys aged 9 to 12 at his private boarding-school and others at the public school later on. His nurse-maid used to invent excuses for beating his nates with a long lead-pencil when he was aged about 7, and he saw occasional whippings with clothes removed in the family nursery.

When nearly 16 he was initiated into masturbation, which at once coincided with rapid mental development and success at school. He has practised it ever since under same conditions and restrictions as marital intercourse. Religion has never acted as any restraint, and the best restraint to all young people, in his opinion, is to warn them on hygienic grounds. (He became a freethinker at 17, partly on observing the inconsistency of religious persons in this connection. He was twice set upon by Catholics when 16, who attempted mutual masturbation.) He can

vaguely remember some such warning when very young from his mother.

No intercourse with women till age of 19, though strong homosexual feelings from 10 upward, associated with feminine youths. These feelings were quite distinct from feelings of affection and friendship for more virile youths. An attack of gonorrhea at 21 was followed by an operation for circumcision, which had beneficial effects, but did not prevent an attack of syphilis at age of 23, caught at a guaranteed state establishment in France. Intercourse almost always with prostitutes, on prudential and worldly grounds, though what he approves would be greater laxity between boys and girls, with proper safeguards against undesired offspring. He is now happily married. He only indulges in masturbation at times when intercourse is impossible (e.g., childbirth). It is then practised once or twice a week in the early morning; overnight it causes troubled sleep, brain activity, and constipation. This seems ethically more desirable unless the wife were to condone physical infidelity, which she would not, and even then there might be risks of venereal disease. His general health and working power are in all respects excellent, as the venereal diseases were speedily and thoroughly cured. Homosexual feeling has entirely disappeared since marriage.

HISTORY XV.--G.D., English; aged 60. "My earliest essays in juvenile vice were due not so much to unguarded as to unguided ignorance. I slipped where my natural protectors suspected no danger, and I fell because I had never been warned of the treacherous nature of the ground. Before or soon after I was 7 years old, the example of an elder brother, who had lately begun to go to school as a day-boy, initiated me into the mysteries of masturbation, which seemed to me then as harmless as it was fascinating; and the novel pleasure was almost daily indulged in, after I had acquired sufficient dexterity to accomplish the act within a reasonable time, without a twinge of conscience, either in that brother's company or when alone. Decency demanded secrecy in the gratification of what soon became an imperious desire, and the preliminary operations included, almost from the first, mutual _fellatio_ and approximation of the excited organs; but similar privacy was very properly sought during the performance of other bodily acts associated with those 'less honorable

members,' and it appeared to me quite as natural and right for us to amuse ourselves together in that way as for a married couple to hide their most intimate embraces from the observation of others. Indeed, I went farther than that, and even came to regard the absence of all shame between us as akin to the primeval innocence which Adam and Eve exhibited before the Fall. I believed for long that we two were specially privileged and possessed a peculiar sense denied to other boys, for I had never heard of masturbation till I learnt, not the word indeed, but the thing itself.

"My curiosity about the real nature of sexual union in the case of human beings set my intelligence to work at the interesting problem, and by carefully studying certain parts of the Bible, Lemprière's classical and other dictionaries, as well as by persistently watching when I could the amorous proceedings of domestic animals, I learnt enough to make its most prominent features pretty clear before I was 11 years of age. I was then all eagerness to have the opportunity of inspecting at close quarters the genitals of women or young girls, and a stay at the seaside when I was 12 made the latter at least feasible. When the shore was nearly deserted, between 1 and 2 P.M., the daughters of the fisherfolk used to besiege the bathing machines and disport themselves in the water, bathing and paddling in various stages of nudity. I would pretend that my whole attention was being given to the making of miniature tunnels in the sand, while all the time I slyly peeped at what I most desired to see, whether in front or from behind, as the dancing damsels stood upright or stooped till their haunches were higher than their heads. I had already read something somewhere about the clitoris, and wanted especially to see it, but indistinct glimpses were all that I could obtain; nor was it until I visited an anatomical museum, which then existed at the top of the Haymarket in London, that I learned, a good many years later, from several life-sized models there displayed, the characteristic features of that part, as well as the abnormal modifications to which it is subject, either congenitally or in consequence of profligate habits. I was 15, I think, when I first came to know that girls can masturbate as well as boys.

"Long after I had realized why the terms male and female are so distinguished, my imagination was occupied with the possible

postures in which the act of copulation may be accomplished by a man and woman; from Horace, Lucretius, Martial, Aristophanes, and, above all, from Ovid's Ars Amatoria I obtained much, but not always very clear, information while still a schoolboy. This was supplemented later by photographic pictures from Pompeiian brothels and photographs from life, purchased at Florence and gloated over one night, with twice-repeated masturbation, and afterward destroyed in a revulsion of shame.

"But while continuing to practise self-abuse (with a certain degree of restraint indeed, but seldom less often than once or even twice a week), after I had been made fully aware of its perils by Dr. Adam Clarke's alarming comments on Genesis xxxviii, 9, when I was about 12 or 13, I never had connection with a woman until I married somewhat late in life. This abstinence was not due to any frigidity of disposition, but from prudential and religious motives, and, to some extent perhaps, from the imperfect but genuine satisfaction afforded by solitary indulgence. My imagination, like that of young J.J. Rousseau, as set forth in his Confessions, was allowed free scope for its exercise, but in practice I confined myself to what seemed to me comparatively innocent as compared with fornication. I was never an unreserved 'exhibitionist' like Rousseau, but I have on more than one occasion turned toward a hedge and pretended to make water, when a girl had just passed me on the road, showing a turgens cauda if she should chance out of curiosity to look back, as once, at any rate, happened.

"I watched with interest the first indications of puberty in my own person. I had, of course, seen the pubic hair on many of my own sex, but I was 17 when I first saw a naked woman. She was standing at the door of her machine, wringing out her bathing-dress, as I swam past, and her face was hidden by the awning then used, so that she could not see me. A slight effusion of limpid mucus began to characterize the orgasm, at the age of 12 or 13 (before any ejaculation of semen was experienced), such as exuded later from the urethra when salacious excitement reached a certain pitch, even though the final climax might be postponed or prevented altogether. I found it a refinement of luxury to prolong the period of tumescence as far as possible, by frequently checking a too rapid progress toward the goal. By this practice of repeated arrest when the orgasm was imminent, and the

mental debauchery which was its habitual accompaniment, I believe I did my nervous system more damage than by anything else--even the early age at which the dangerous indulgence became established. Nocturnal emissions (the sequel of lascivious dreams) commenced when I was about 15, at which age I had my first experience of an involuntary discharge when awake, under the influence of purely mental emotion; but this latter mode of escape did not often happen, and later on ceased altogether. My muscular strength was not impaired by too frequent indulgence, and I acquired some athletic prowess on the football field and on the running path, both as a boy and as a young man. Walking tours were for long my favorite recreation, even after the bicycle became an increasing attraction. My health, however, suffered in other ways from too constant absorption in lustful thoughts, which found vent in erotic verses and tales, generally destroyed soon after they were written. I have been subject since I was a boy to more or less prolonged fits of mental depression. How far I have inherited this tendency (my father and his father both married first cousins, and a neurotic diathesis has been characteristic of our family), or how far it has been aggravated by pernicious habits, I cannot say; cause and effect have no doubt acted and reacted on each other.

"As I grew toward adolescence I endeavored to make self-abuse as close an imitation as possible of sexual intercourse by such methods as may be easily imagined. My biological studies (I won a scholarship and took honors at my university) were directed with most intent predilection toward the reproductive system, particularly the modifications of the copulatory organs in different animals and the diverse manner of their employment. The sexual instinct, whether in its normal or abnormal manifestations, is a subject which has always had a strong attraction for me, nor has it lost its fascination with the growth of years (I am now 60) nor the competition of other interests.

"My very limited experience of the sexual system in women would lead me to believe that the clitoris is the only peculiarly sensitive part of the female genitalia, coition giving no pleasure unless 'the trigger of love' is simultaneously manipulated, as can be done when intromission is effected a tergo; that the mind of a normally healthy maiden is altogether

free from sexual excitement of a physical kind, and that little curiosity is felt about the precise modus operandi of conjugal intercourse; but, nevertheless, I have good reason to believe that this, if not an unusual type, is by no means the only one that exists.

"As to sexual inversion my personal experience has been confined to two or three grandes passions for boys, the first of which possessed me when between the ages of 16 and 18, and involved, when I was 17, the most intense mental emotion, of a romantic kind, tinged with poignant jealousy and vexation at comparative coldness toward myself. These love passages never led me into indelicate behavior (I was once threatened with such treatment myself by a stranger whose acquaintance I made one day at the British Museum, when a lad of 15. He took me to his bedroom at an inn, locked the door, and showed me a collection of coins, giving me some, and, while doing so, attempted to take indecent liberties; but I pretended that I must catch a certain train, unlocked the door, and made a hasty escape), nor was any gratification sought beyond occasional kisses and other innocent endearments, though such caresses would sometimes excite an erection, which I carefully concealed. These amours were, however, no outcome of perverted instinct, nor were they any bar to fancies for the opposite sex which affected my imagination rather than my heart."

HISTORY XVI.--This history is given in the subject's own words: A.N., 34 years of age, a university graduate, devoted to learning and interested in philosophy and theology. He is happily married and the father of an only daughter. Since puberty he has enjoyed excellent health.

"Looking back he finds the beginnings of sexual feeling obscure. This feeling is by no means identical in its progress with the knowledge of the phenomena of sex generally. The latter he acquired thus: His mother told him at a very early age the outlines of the phenomena of birth and explained to him (perhaps at that time unnecessarily) that the genital organs of little girls were different from his own. This piece of knowledge led to his asking, when 9 years old, a little girl cousin who came to live with the family (he was an only child) and who shared his

bed to let him see her genitalia. This she readily did and also invited him to coitus, which she described as a 'nice game.' He complied, but without, of course, any feeling of pleasure or any understanding of the nature of what he was doing. Shortly after this he went to a day school, where, amid the extraordinarily coarse conversation of the boys, he was initiated into all the more obvious phenomena of sex. But still it was only a matter of intellectual curiosity. As such it had a strange fascination for him, and to this day he remembers many of the obscene words and phrases, as, for example, a set of indecent verses beginning 'William, the milkman, sat under a tree,' describing coitus, though some of the details were yet misunderstood by him. That up to his tenth or eleventh year no real sexual desire was awakened is plain from the fact that there was no desire for any repetition of attempts at coitus with his cousin, though he did indeed, again out of curiosity, finger her genitals sometimes, a thing which she, grown evidently more fastidious, reported to his mother, who gravely reprimanded him, telling him that it was the 'beginning of all evil.'

"Desire was awakened gradually and, as I have said, obscurely. Not only at school, but among his own cousins, especially two girls (other than the one above mentioned) and a boy, the conversation was lascivious in the extreme, though words never proceeded to deeds as between the boys and the girls. He was soon, however, about his fifteenth year, so far as he can remember, initiated into the practice of masturbation, first, sleeping with his boy cousin, the two used to play at 'husband and wife,' and then, more directly, a neighbor, a heavy, sensual type of boy, took him aside one day and drawing out his own penis asked him 'if he knew how to make some buttermilk.' Out of curiosity at first, and to obtain the new and voluptuous sensation afterward, he began assiduously to practise this vice, which, as he afterward found out, was very common, if not universal about him. That it was morally reprehensible he had not at that time the ghost of a notion; he considered that it belonged to the category of the 'dirty' only. His father quite neglected this development, believing, I suppose, in the superstition of the 'innocence of childhood.'

"This practice of masturbation went on assiduously to his sixteenth year, when its true nature and danger were revealed to

him by a good clergyman who prepared him for confirmation. He had at this time gone far, in both solitary vice and vice 'à deux,' with his male cousin, with whom he practised even 'fellatio' and 'intromissio in anum.' But now he began to struggle against it and made some headway, but never entirely shook it off before his marriage at 26, so deeply rooted was the hold it had on him. Especially at the time between sleeping and waking, or while lying sleepless at night--when the monks prayed 'ne polluantur corpora'--did its attacks come insidiously upon him. He would struggle for weeks and then would come a relapse. On one occasion he slept with a young uncle who amused himself, thinking he was asleep, by playing with his penis until he had an emission. A.N. hailed the occasion with keen joy--he caustically argued that he experienced the pleasure without being culpable in its production! Then on 'coming to himself' he would agonize over his vice, remembering, for example, that, while he had rejoiced in what had been done, the very cousin who some time before used to share his sin was genuinely annoyed at the same uncle's attentions when it was he who suffered them.

"Looking back over the whole period of his youth and adolescence, he can trace the psychological effect of what was going on secretly, in his relations to girls and women. In a word, these relations were sentimental only. He often imagined himself in love; but it was imagination only. He was in love with a wraith, not a girl of flesh and blood. He hesitated to regard in any sexual way any girl of whom he had a high opinion; sexual desire and 'love' seemed for him to inhabit different worlds and that it would be a pollution to bring them together. In hours of relaxation from the very hard intellectual work which he was at this time engaged on at school and at the university, he was quite content with the society of quite young girls or even children when most of his friends would have sought out females of their own age. Nothing could have been farther from his desires or intention than any lascivious or, indeed, unseemly act toward any female in whose company he might be: no mother need have hesitated to trust her daughter in his company. I firmly believe that the discipline of the same bed which Gibbon (*_Decline and Fall_*, ed. Bury, vol. ii, p. 37) makes so merry over could have been endured by him without difficulty. His outward conduct was in all these respects most seemly and decorous, yet night after night he could masturbate, his

imagination glowing with visions of female nakedness.

"Curiously the one and only actual female for whom he felt any desire at the earlier period (aged 14 to 16) began to be the cousin who lived in the house. On one occasion he touched her breasts, on another her naked thighs--and that was all! As she grew to puberty, she would have allowed far more liberties, but he contented himself with a sly glance now and again, when he could procure it, at her swelling bosom. The fear of putting her with child was ample to keep him away from her bed. Later on even so much as the foregoing occurred no more, and, as I have said, his outward life became absolutely decorous.

"Consequently he was in no danger of having dealings with prostitutes. The preliminaries, the conversation of such women, especially their drinking habits, would have been disgusting and repugnant to him in the extreme. He would have shunned the possibility of acquiring venereal disease like the plague. But he was never free from solitary vice; he secretly envied those who had occasions for coitus in what I may call a seemly and cleanly manner, friends in the country with farm girls, etc., of whom he had heard. He indulged also in lascivious reading, the obscene when he could procure it, rather than the merely suggestive, which has never been to his taste. He was familiar with quite a large number of Latin and Greek indecent passages, knew the broader farces of the Canterbury Tales and of the Decameron, and, later, the 'contes' of La Fontaine and the Facetiæ of Poggio. As Ste.-Beuve says of Gibbon, I think, he acquired an 'erudite and cold' sort of obscenity in this way.

"All this, of course, is only one half, and by no means always the dominant half, of his nature. He was often repentant for these delinquencies, and he was sincerely religious. He was also fond of serious learning and contrived to take a first-class university degree. Yet, ever and anon, the deeply sensual side of his nature made itself felt. Scotched for a time it could be, but killed never.

"Yet, I do not think it could be said that he had the sexual instinct in any really high degree. It was more like a small fly that makes a large buzz than any considerable factor in his constitution. He had a companion about this time of whom such a

remark is even more true. This man's mind was replete with all manner of risky stories, all sorts of sexual details. He would take long walks with girls of loose character, talk with prostitutes at home and abroad, and yet, I believe, he never proceeded to coitus.

"Such then, was the subject of this notice up to the time of his marriage. Two men, one might say, in one skin. One learned, one merely obscene; one a pattern of decorousness, the other a self-polluter.

"On the sexual side he was as one knowing everything there is to know--yet knowing nothing. Like the boy-hero in Wedekind's Frühling's Erwachen, he had been long in Egypt, yet he had never seen the pyramids. He began to distress himself with questions as to whether he was yet capable; whether his recurring vice had not permanently injured him; whether he had made himself unfit for marriage. So shy and reserved was he about his secret that he could never have brought himself to mention it to a medical man. 'What! he! the good, the religious! the wholly moral and decorous!' (such was, indeed, the reputation he had among his friends); 'he, the victim of a vice so black!' No, no! 'Secretum meum mihi,' he cried.

"Fortune, however, was kind to him. He was at an early age free from financial worries, which had almost crushed him earlier in his career, and he met in course of time the family from which he selected his excellent wife.

"The society in which he lived was of all English classes, I should suppose, the most reticent in matters of sex--the respectable, lower middle class; shopkeepers and the like, with a tradition of homely religion and virtue. The classes a little higher in the scale (to which, by the way, his mother had belonged) could far better sympathize with one in his position. Well, the family of his future wife was of a higher class and, what is far more, of foreign origin, for whom a large number of our English 'convenances' do not exist. To them sex was frankly recognized as a factor in life, and the mother of this household, as he grew more intimate, broached subjects which he had never, in such a manner, discussed before. It is unnecessary to give here any general history of his relationships with this

household, as they have nothing to do with the matter in hand. After some time he became engaged to the youngest daughter, two years his senior, a woman of remarkable beauty and splendid development, one who attracted him as none other had done, both on account of her intellectual and social qualities and her physical beauty (he had hitherto despaired of finding the two combined in one person), for she is certainly the most beautiful woman with whom he has ever been acquainted.

"He now began to make the practical acquaintance of a woman--and one who, in impulses, temper, manner, and habit of thought, differed *_toto cælo_* from the girls he had known in his old home. Her sexual nature was ripe and developed, and it is lucky that the engagement was of short duration, or the strain and anticipation of that time might have been injurious to the health of both. As usual, in his outward relations toward women, so toward his *_fiancée_*, he was prepared for chaste caresses only. This, however, did not suffice for her hot and passionate nature. They went as far as possible short of actual coitus.

"After a few months, however, the marriage took place, and, at first, this brought him bitter disappointment and seemed to confirm his worst fears. He found himself quite unable to have pleasure or satisfactory coitus; quite incapable, with any erection that he could command, of introducing his well-developed penis into his wife's extremely narrow and contracted vagina. About a fortnight after the marriage, however, on his return from their short wedding tour, he felt much stronger and copulated with her, especially in the early mornings, so satisfactorily that she soon found herself with child. Coitus now began to be much more pleasurable for him, but to his wife still attended with pain.

"After nine months of married life, the child, the only offspring of the marriage, a healthy girl, was born. The stress of this time, the upsetting of his wife's health, her nervous breakdown and consequently uncertain temper, seemed for a period of nearly two years effectually to repress any sexual desire in the husband, and this period is perhaps the chastest of his life. Desire seemed to be the one thing absent. The revulsion of feeling in his wife was remarkable. The erstwhile amorous *_fiancée_*, who could hardly wait until marriage to test her

lover, became now the wife and mother who hardly wished to be touched by her husband.

"Her health, however, gradually improved and a more normal state of affairs was brought about, which has continued to the present day, broken only by periods of abstinence, chiefly caused by the attacks of anemia and menstrual irregularities from which his wife suffers from time to time. Ordinarily, he enjoys coitus once or twice in the month, hardly oftener, taking one month with another. At one time he exemplified in his own person the saying *_omne animal post coitum triste_*, but now happily this depression of spirits is rarely felt. Sometimes he has felt a depression of spirits, a general discontentedness, before experiencing a strong erection; in these cases coitus has cleared his spirits. He would naturally look upon coitus as an evacuation, although he recognizes the imperfectness of that view. For one thing he is constantly sorry, viz., that the act gives no pleasure to his wife, and that he has never been able to induce a crisis with her by normal means. In this state of affairs, knowing that 'après coup' she was still unsatisfied, he slipped into the practice of rubbing the clitoris with his fingers until the emission takes place. To do this, they assume the position 'ille sub, illa super.' From his own limited marital experience, he has never been able to understand the stories of women who masturbate several times a day, as his wife would be physically incapable (so he believes) of anything of the kind, and only easily reaches the crisis in any circumstances during the first few days after the menstrual flow has ceased. In fine, while agreeing theoretically with Sir Richard Burton and others that the eastern style of coitus (directed with a view to the pleasure of your partner) is the right one, it is one of his standing regrets that he is unable to practise it. In the place of the twenty minutes required by the women of India (according to Burton) he is happy if he can give two or three at the most, much as he would wish to prolong a pleasure as keen to himself as he could desire it to be to his dear and excellent spouse."

HISTORY XVII.--R.L., American; aged 43; height, 5 ft. 7 in.; weight, about 145 lbs.; occupation, teacher; somewhat neurotic; a slight myopia associated with acute astigmatism and muscular weakness of the eyes, producing a tendency to migraine. Uric acid diathesis, producing occasionally severe neuralgia, particularly

in the intestines. These symptoms have been more or less constant since very early childhood. General health very good. Not inclined to indulge in athletic sports, but prefers sedentary occupations and recreations.

"My early ideas of sexual things are not very clear in recollection. I think that when 7 or 8 years of age I had a knowledge of the common or vulgar terms for intercourse and for the genital organs. Boys of my own age and slightly older would discuss sex relations, and I had a general knowledge that, in some way connected with the sexual act, 'babies were made.' We would tell, occasionally, lewd stories, and a few times attempted sexual practices with one another. Not till after puberty did I ever attempt masturbation. I must have been 9 or 10 years old before I learned that there was a difference in the sex organs of boys and girls. Up to this time I had supposed that intercourse was _per anum._ I attended a public school with both sexes. Talk among my boy associates was often nasty and concerned the sexual act with girls. At about 12 years I began to have erotic day dreams. I always had a sentimental attachment for some girl acquaintance whom I would idealize and with whom I would imagine myself having sex relations. As a matter of fact, there was no real sexual feeling about this. As I was very shy and timid naturally, I never made any kind of advances toward any of them, and they were entirely ignorant of any sentiments of affection in me.

"Pubertal changes commenced, I presume, about the age of 13½ years. I place it at this period from the following circumstances, which are fixed very strongly in my memory: I had, as a child, a soprano voice that was praised considerably by older friends, and about which I was inordinately conceited, I enjoyed greatly taking part in operettas, cantatas, etc. The dramatic instinct, if so it may be called, has always been marked with me, and amateur dramatics are still my chief diversion. When I was about the age mentioned above my voice changed quite rapidly, greatly to my distress of mind, as I was obliged to give up taking a part for which I had been cast in a school entertainment. The memory of that disappointment is still poignant. Other changes, such as the appearance of the pubertal hair, must have made no impression on my mind, as I cannot recollect anything in connection therewith. No involuntary

emissions occurred. Indeed, during periods of continence in later life, when the sexual tension has been very strong, I have had very few such emissions.

"As a lad of 11 or 12, I had heard frequent allusions to masturbation by other boys who were older, but always in a way that indicated contempt. Yet there is no doubt now in my mind that the practice was very general. I think that I was probably about 15 when I decided to try the act. I think that there was little sex impulse in this decision. The animating purpose was rather curiosity. I succeeded in producing the complete orgasm and found it pleasurable, though there was a considerable shock of surprise at the ejaculation of semen. As nearly as I can estimate in my memory of an event as far back as this was, this was the beginning of definite sexual sensibility in me. I cannot but believe, however, that it would have been aroused sooner or later in some other way. Thereafter I would imagine myself embracing some of the girl friends to whom I have referred above, and, when excited, would masturbate. The act was in every instance a psychic intercourse. For some time I did not know that the practice was considered harmful. I indulged whenever I felt the inclination. This at times was rather frequent; again only at considerable intervals. I did know that it was looked upon as being unmanly, and never admitted, except to perhaps two or three boy friends, that I ever indulged. With these boys I practised mutual masturbation a few times. There was no homosexual feeling connected with these acts in any of us. It was only that the normal method of gratifying our desires was not available. I know the subsequent history of each of these boys, and there has been nothing to indicate any perverted instinct in any of them. About the age of 16 I heard a talk on sexual matters by a traveling evangelist, who portrayed the effects of masturbation in fearful colors. I now realize that he was an ignorant though well-intentioned man; but the general effect of his talk upon me was a bad one. One of the results of the habit, according to his statements, was insanity. Therefore I expected at any moment to lose my mind. I felt that I must stop the practice at once, but the matter became so great an obsession that again and again I broke my resolutions for reform. I undertook exercise, dieting, the reading of serious literature: all of which I had seen referred to in books as methods of lessening sexual desire. The object of these disciplinary practices was always the thing most

prominently in mind, and so they were of no avail. Fortunately I entered college a little later, and the affairs of school life gradually took a commanding place in my thoughts, and the practice was not so much in mind. I did not, however, completely break away from it until almost the time of my marriage. If the present attitude of the scientific medical world toward the subject had been known to me, I do not believe that any evil would have come to me from the practice. At a later period of my life, say between 21 and 24, I would not indulge the habit for a considerable interval. At times I did not notice the presence or lack of desire. But then there would come periods when I would be under a severe sexual tension. This would be marked by intense nervousness, an inability to fix my attention upon any one thing, and a great desire to have intercourse. An act of masturbation at such a time would generally give relief. However, when I yielded to this form of relief, there would always follow feelings of profound self-reproach and of self-repugnance. Had I had nocturnal emissions they might have relieved me; but, as I have said before, they very rarely occurred. When, rarely, one did occur I would be greatly frightened, for I had the old, erroneous idea that they meant serious weakness and always ascribed them to my bad habit. That my habit of masturbation had any relation to the rarity of the involuntary emissions would, of course, be a matter of pure conjecture. In passing from the discussion of personal masturbation, I wish to say that my associations with boys as a pupil and as a teacher lead me to believe that the practice is practically universal. When discussing the hygienic evils of prostitution with boy pupils I have noted that, whereas not infrequently a boy will voluntarily protest that he has never had intercourse, there has always been a significant silence when masturbation is mentioned. I have never heard a boy make a denial, direct or indirect, that he had indulged in the practice. But it has seldom been a perversion. It has rather been, as in my own case, an available means of relieving a sexual impulse.

"During my college life I associated with many boys who had more or less regular sexual relations with prostitutes or with girls who were not virtuous. Their attitude toward the practice was an immoral one. The ethical aspect of irregular sexual relations never concerned them. It certainly did not concern me. What I have learned through my conversations on the subject with my pupils makes it evident to me that this is the common feeling of

most boys of the adolescent period. I think of two things which operated strongly to prevent my entering into sexual relations with girls during this period of my life. One was an esthetic repugnance to the average prostitute. These are the women most easily available to the youth whose sexual desires are developed. I do not remember ever having seen an avowed prostitute who did not seem repulsive to me. I confess to an inclination to priggishness. I preferred to associate with people whom I called 'nice people.' It was fortunate for me that I was thrown into the society of a rather rough crowd of youths, who knocked a great deal of this snobbishness out of me. But it did act to prevent my having recourse to prostitution. A second preventive was my natural timidity in making advances to people. This has been a trait that I have never completely overcome. In my professional life this has been some detriment to my advancement. In the matter of sex relationship it tended to prevent my taking advantage of association with and even of advances from girls who, not prostitutes, were nevertheless not virtuous. There were a number of such in the town and neighborhood in which I lived, and I undoubtedly could have had sexual relations with them if I had only been able to overcome my shyness. The desire was not wanting. I really craved intercourse with them. It was simply a matter of cowardice. There was one girl whom I knew very well, with whom I was on friendly terms, who I knew had had sexual relations with other boys. She showed, at times, a marked preference for me, and I am sure would have welcomed any advances that I should have made. A number of times I sought her company with the intention of suggesting intercourse, but my resolution always failed.

"All through my college course I was much in the society of girls. We were in class together, associated very freely in society, frequently studied together. This is the most usual state of things in the western part of our country. But they were simply comrades: sex thoughts never arose in connection with such association. And I am quite certain that this was the general attitude of the other boys. Although the talk among the boy students was at times, very frankly and crudely, about sexual relations, no breath of scandal ever touched one of the college girls. Again my experience as teacher and student brings a conclusion that coeducation of the sexes does not affect, in one way or the other, the strictly sexual life of the male student. A

very intimate friend who has had a varied experience in school work has told me recently that his conclusions are the same.

"When I was about 20 years old I became acquainted with a very beautiful girl, four years my junior. Our acquaintance very rapidly developed into deeper affection, and about five years later we were married. During all this time very little of the physical aspects of love entered into our attachment. My sweetheart had much of the same shyness as was so pronounced in my own character. For several years I think that the thought of marriage was never distinctly present in our minds. A formal betrothal between us did not take place until within a year and a half of our marriage. Yet each of us had a very distinct understanding of the feelings of the other. But until our betrothal there were none of even those very innocent expressions of endearment common, I imagine, to all lovers. I am sure that during this period of our attachment no thought of any physical relations between us was ever in my mind; or, at any rate, was promptly banished if it occurred. Yet all this time my sex desires were very strong and at times became an obsession. Never, though, were they directed toward my sweetheart. The first time that we engaged in the endearments and caresses allowed to lovers I became conscious, after a time, of a state of sexual excitement. I experienced an erection. It was absolutely reflex; no thought had entered into it. I was at once overwhelmed with a feeling of shame. I felt that I had been guilty of unthinkable indecency toward my betrothed. Then there arose a fear that it might be noticed. (Men at that time wore abominably tight clothing.) As a matter of fact, I now know that there was no real danger of this, for she was absolutely ignorant of the nature of the male sexual organs. But I made a pretext for withdrawing from the room and tried to adjust my clothing so that no exposure could occur. I was fearful of coming into close proximity to her again, lest there should be a recurrence of the feeling. As a matter of fact it did occur a number of times, but my good sense finally suggested the explanation and after a time it ceased to trouble me. The thought was latent in my mind that sexual excitement was necessarily more or less indecent at all times, and I could not reconcile its manifestation with a pure love.

"I have said that my sexual desire was strong. Up to the time of marriage it was never gratified in the normal manner. My esthetic

abhorrence of prostitutes continued to prevent its gratification in that manner. No other opportunity offered. I am positive that moral considerations did not enter into the matter at all. I think now that it was strange that the thought that it would be disloyal to my promised wife to have connection with other women did not affect me. But I am sure that it did not. I am inclined to think that conscientious scruples very rarely enter into the average young man's considerations of contemplated sexual relations.

"As the time of my marriage drew near, thoughts of the physical relationship of husband and wife became, of course, more insistent. The idea of establishing sexual relations was not at all a pleasant one. I dreaded it as an ordeal. I wondered if it would be possible for us to retain the same love and affection for one another after such intimate relations were established. This was a recurrence of the fallacious notion that there was something inherently indecent in sexual things. I am in hopes that other ideas are replacing this wrong one, in the minds of the younger generation, as the result of the saner and franker discussion of sex. By a great effort, I had practically stopped masturbating. At times I felt almost maddened by desire. But never did the prospect of marriage seem desirable from this point of view. Up to the very day of our wedding my affection for my betrothed seemed free from sexual desire. But my physical being was craving sexual companionship.

"Theoretically I knew a great deal of the nature of intercourse. Practically I was absolutely ignorant. In some ways I was better informed, on matters that a new husband should know, than the average man entering the married life. A physician's library had been at my disposal, and I had read somewhat extensively on physiology and hygiene. My chosen lines of study had given me a theoretical knowledge of the anatomy of the female genital organs that was fairly thorough. I knew a little about the physiology of reproduction and rather less of intercourse. Fortunately, I learned in the course of my reading that the first sexual approaches were likely to be quite painful to a woman, and that great care should be exercised at this time. I tried to put into practice what little I had learned in theory and I imagine that we got through the introductory attempts with less than the average difficulties. Our first efforts were not satisfactory to

either of us. My wife was absolutely unprepared so far as any definite knowledge of the act was concerned. I sincerely hope that the prudish notions of the past generations will give way to more sensible views in the future, and that the girl becoming a wife will be just as chaste, but wiser in matters of such importance to her happiness. I presume that my timidity was a valuable asset at this time; for I was afraid to force matters in any way, and time and repeated attempts finally overcame our difficulties. And when our sexual relations were once established, the whole tenor of my life was changed. All the former sexual unrest disappeared. My former feeling toward sexual relations was altered. They no longer seemed that which, though very desirable, was yet necessarily indecent. Fortunately, after the first few weeks, they have been quite pleasurable to my wife. I am sure that our sexual life since marriage has been a large factor in deepening the love that has made our married life an ideal one. As I look back at the first year of marriage, I wonder that we got through it so well. My knowledge of sexual hygiene was a strange mixture of fact and nonsense. If the frequency of acts of intercourse advocated by some of the authorities I have lately read is correct, then we must have passed the bounds of moderation. But it is certain that our general health has been very good: better in both cases than before marriage.

"In reviewing these phases of the development of my sexual life, one or two conclusions seem to me to be strongly emphasized. It was unfortunate that the real sexual desire was aroused as early and in the manner that it was. Whether this would have been prevented by more definite education in the hygiene and the purpose of the function, I can only conjecture. I believe that mine was and is the common experience of boys. I am decidedly of the opinion that there should be instruction given of the anatomy of the genital organs and of the hygiene of intercourse, and this shortly after the youth has reached puberty. How this is to be done is a grave question. It will require tact and knowledge not possessed by the average teacher and parent. However it is done, it should be honest, frank, and free from piosity.

"I am certain that, in my own case, rather frequent intercourse is decidedly beneficial. Any prolonged abstinence always brings about the same nervous disturbances that I have referred to above. It is fortunate for me that this repetition of the act is

satisfactory to both concerned."

HISTORY XVIII.--E.W., dentist, aged 32, of New England Puritan stock. Height, 5 ft. 10½ in.; weight, 144 lbs. Spare and active, of nervobillious temperament.

"My earliest recollection is being punished for 'playing with myself' when I could not have been more than 3 or 4 years of age. I distinctly remember my exultation on discovering that I could excite myself (while my hands were tied behind my back for punishment) by rubbing my small but erect penis against the carpet while lying on my stomach. At this time, of course, I knew nothing of sex or of what I was doing. I did what my desires and instincts at that time prompted me to do. However, punishments and lectures failed utterly to break up this habit, and, though I always wished and tried faithfully to obey my parents, I soon grew to indulge quietly in bed when I was thought to be asleep. The matter apparently passed out of the minds of my parents as soon as they ceased to detect me further in the act, and they regarded it as abandoned. I now feel reasonably certain that this precocity was due to an adherent foreskin which covered the glans tightly almost to the meatus, and so kept up a continual irritation.

"I have no recollection that anyone ever taught me the habit, and I know beyond a doubt that no one ever learned of the habit or even a word as to the possibility of autoexcitement through word or deed of mine. My recollection of the sensations is that there was a short period of excitation, usually by rubbing, which was not particularly, often not at all, pleasurable, and this was followed by a single thrill of pleasure that extended all over my little body. The curious thing was, however, that there seemed to be no limit to the number of times I could consecutively produce this sensation. My recollection is perfectly clear of how I would lie in bed of a morning and thus excite myself time after time. As I grew older this condition, of course, changed. Masturbation was not a consuming passion with me at this or any other time. I enjoyed it and felt that in it I had a means of entertainment when other sources of enjoyment were not at hand.

"By the time I was 6 or 7 I had figured out the difference in sex

in animals and suspected that 'all was not as it should be' in some portions of a girl's anatomy. This suspicion was suddenly confirmed one never-to-be-forgotten morning, when I induced my dearest playmate, a little girl, to urinate in my presence. I was more thunderstruck than excited over this discovery, and it led to no results in any other way, nor did we ever again unveil ourselves to each other. At this time I began to learn from the older boys the pitiful, childish vulgarities and common terms of sex, and to invent and exchange rhymes and stories that were pathetic in their attempts at vulgarity.

"At the age of 11 a buxom servant-girl threw out some vague hints to me,--I was very tall for my age,--and tried to induce me to take liberties with her, at least to the extent of telling her vulgar stories, but I would not rise to the lure. I believe that the thing which held me in check was fear of discovery by my parents and the consequent humiliation. A short time previous to this my father had enlightened me as to the means and manner of reproduction and had encouraged me to talk to him and to my mother on such subjects rather than with anyone else. I think this had a great influence for good, as it made me feel that I had some authoritative knowledge and that I was trusted by my parents. My determination not to prove entirely unworthy of their trust has been the anchor that has held through all the storms and temptations of youth and young manhood.

"About the age of puberty I began to long for more realistic experiences and tried through a period of a year or so the disgusting experiments of intercourse with animals, using hens and a cow for this purpose. Details are of no importance, and I spare myself their repetition. My better nature or general mental development soon overcame my desires in this direction, and the practice was abandoned.

"With the dawning of the power of emission I noticed that the adherent foreskin before alluded to, which had never been examined during all these years (as I had discovered that I was different from other boys and so was shy about exposing myself), began to trouble me by being painful during erections. Accordingly I took a buttonhook and tore all the adhesions loose. A very painful though ultimately entirely satisfactory operation!

"(I may mention in this connection that my two sons were afflicted with adherent foreskins to such an extent as to render circumcision necessary a few days after birth, in order that the function of urination might become fully established.)

"As my powers developed I had my first wet dream at about the age of 15, and was much surprised thereat. My father, however, told me not to be alarmed and soothed my anxious fears, which were easily aroused by my guilty feelings on account of my habit of masturbation, in which I still indulged from one to three times a week.

"Between the ages of 12 and 17 my father had the good judgment to require a large amount of active outdoor labor from me, as well as sending me to excellent schools. Certain kinds of study had a distinct effect upon the sexual organs, namely, difficult Latin and German translations and problems in fractions. I considered at the time that it was because my mind wandered from the subject I was studying. Now I am perfectly sure it was because my mind focused on the subject I was studying. At any rate the fact existed, and when alone in my room, wrestling with a knotty problem, I used almost as a rule to keep myself in the most violent state of erection for long periods--an hour or so--sometimes ending with an emission, but more often I forced myself to forego this climax through fear of overindulgence. During these years my curiosity as to the exact nature of the female organs was something terrible, and I wasted many hours and much ingenuity in the attempt to surreptitiously gratify it. My perseverance in the face of failure along this line was surely worthy of a nobler cause.

"I was much in the society of girls of my own age or older during these years and until I was 19. I found with them a keen and entirely pure and wholesome enjoyment utterly separate and apart from the desires and indulgences which I have been describing. I never cared for any girl who was 'forward' or in any way unladylike, and the idea of taking any undue liberties with any of my youthful sweethearts was as remote from my thoughts as a trip to the moon. Perhaps I can say this better and more distinctly by stating that I would be perfectly willing to have my wife know of, or my boys repeat, any action that I ever took

with any woman.

"I spent my spare time in their society and lavished upon my girl companions every cent I could spare, but had no thought of immediate sex desire or gratification. At the age of 17 I went as an apprentice in my present profession of dentistry. Whenever it became necessary for me, in assisting at the operating chair, to touch a lady's hair or face, I would be seized with the utmost confusion and could with difficulty control my hands so that they did not tremble. This soon wore off as I came to a realization of the true professional spirit and attitude toward all patients, and, needless to say, has now become a matter of the utmost indifference to me.

"From 19 to 22 I attended a professional school in a large city, remote from my home, where I was an utter stranger. During these years I devoted myself to my professional studies and to music with much diligence. I took an active part in all student life and problems save only that of the 'eternal feminine.'

"Frequently I have been out with a crowd of 'the boys' when they headed for a brothel, and have been the only one to turn back or to remain on the sidewalk as the door closed behind my last companion. I say this not in self-praise, but in the same spirit of accuracy which has prompted me to put down everything concerning this greatest mystery of our natures as I have experienced it and worked it out.

"It was during these three years at school that I placed upon myself the most stringent and effective curbs to my sex nature. I somehow never could 'get my own consent' to go to a brothel or stay with a 'soiled dove,' for I had by this time firmly resolved that I would bring to my wife, whoever she might turn out to be, a clean body at least. I limited myself in my autoexcitement to one emission a week and on one or two occasions went two weeks without inducing an emission. Spontaneous nocturnal emissions were quite common during these years. I cannot state just how frequent they were, but perhaps one a week would be a fair average.

"Shortly after graduation at the age of 22 I became engaged to the woman who is now my wife. (She was 17 at the time of our

engagement, brunette, well developed, and with a wisdom and charm that have held me a willing captive for ten years and no prospect of escape!)

"With our engagement began for each of us that divine and mysterious unfolding of the nature of one to the nature of the other. Our engagement lasted two years and a half and, ignorant as we both were, I am sure that it was none too long. Never shall I forget the surprise I felt--to say nothing of the delight--when I discovered that my sweetheart was as anxious to find out the uttermost facts about me as I was to explore the divine mystery of her sweet body.

"We lived in different towns and I used to spend Sundays at her home. I slept in a room adjoining that occupied by my betrothed and a friend. There was a transom with clear glass over the door which connected these two rooms, and to have stood upon the foot of the bed and looked through this transom would have been the easiest thing in the world, and was such an opportunity as I would have given years of my life to have obtained in my adolescence; but now that the chance was afforded me to freely spy upon the chamber of my future bride my soul revolted, for the feeling was upon me that not until it was revealed to me because she could no longer bear to keep it concealed from me would I look upon the blessed vision of her maiden loveliness. Nor was I disappointed, for gradually we became acquainted with each other's bodies, and this gradual unveiling of each to the other led, during the last months of our engagement, to mutual manual manipulations, excitement and gratification. Intercourse did not take place until the second night after our marriage, and our first baby was born nine months and three days after our marriage, though my wife was ten days past the cessation of her period at the time of my first entering.

"Since marriage I have made it my first duty to study my wife's inclinations and desires with regard to our sexual relations, and can say that now, after seven years of married life, and after she has borne me two sons, we are enjoying a fullness of happiness that neither of us would have believed possible during the first year of our married life.

"I have found that the woman must have the entire charge of the

time and number of approaches in a week or month, and that when she is for any reason disinclined to the sexual act the husband must keep away, no matter how he feels about the matter. Also the man must be sure that his wife reaches the orgasm or is at the point of it before he allows himself to 'let go.'

"Our meetings have averaged eight or nine a month. During the latter months of pregnancy they were _nil_, and in the month following an enforced separation of several weeks they were fourteen. We have never tried nor had the slightest curiosity to know how far we could indulge ourselves.

"For myself I seem to demand a gratification of the sexual desire rather oftener than my wife, and when I feel I cannot get a good night's rest without first being relieved of my seminal burden, while at the same time my wife is disinclined to the sexual act, I have her perform manual manipulation until relief is effected. Mind, I say _relief_, for the emission gives me very little pleasure under these circumstances, but it does give _relief_. In my present health I find I cannot sleep well if I go over more than two nights without an emission. My wife understands my condition, and is entirely willing to assist me in this way when she feels she cannot give me the gratification which I crave. We have come to see sex matters as they are, and respect and reverence have taken the place of ignorance and fear.

"To sum up, owing to lack of circumcision the sex instinct developed too soon and out of all proportion during my early youth. I cannot see that masturbation has ever had the slightest bad effect upon my health or mental state (except as I was constantly loathing myself more or less for being unable to stop it).

"The husband must subordinate himself to the wife in order to obtain the highest good and pleasure of both.

"I have always been successful in my undertakings. Stood at the head of my class at school, and in my professional work graduated with highest honors. I have a memory for prose or verse that is the cause of envy to many of my friends. The facts here set down are recorded in the interest of advancing study along this most important but neglected and ignored line. That they have been

truthfully recorded without favor to the black or light on the white is my sincere belief."

HISTORY XIX.--E.B. Parents sound; strong constitution in mother, moderately so in father; vigorous and healthy, but of refined nature. Breast-milk for six months.

"_Age 4-5_. Took great delight in the little waterworks. Severely punished for this. Interest in the parts morbidly increased thereby.

"_Age 5_. Earliest recollection of 'counter-erection'--the penis shrinking tensely into itself, producing local and general discomfort. This resulted from certain kinds of _mauvaise-honte_,--having to kiss aged persons, having officious help at micturition, bathing, dressing, etc., which caused a sort of physical disgust. Toward puberty the experience grew rare. One such occasion was at about eighteen, when solicited on the street by a prostitute. The very _idea_ of homosexual relations produces it. It would appear to be a powerful safeguard against promiscuous sex relations. I have met two men subject to the same thing, and have heard of one woman subject to something analogous. It might be called a nausea of the 'nether heart' in Georg Hirth's phrase.

"_Age 6-7_. Earliest recollection of erection. Unprovoked at first. A disposition to _punish_ the organ and satisfaction in doing so. From this time erection took place whenever it was thought about.

"_Age 10_. Present at a discussion in the playground about the best way of intercourse, which I heard of for the first time. This was followed by enlightenment on the source of children. Concluded it must be very painful to both parties. 'Just the other way,' I was told. But the idea of pain to the genitals was 'interesting' to me. Pain felt by the other sex was 'interesting.' Pained looks captivated me--I liked to imagine some mysterious trouble; and, as I learned more, 'female complaints' interested me greatly in their subjects. I got a 'grateful pang' at the pit of the stomach at the thought, but neither erection nor the opposite. This hypogastric feeling has

continued to associate itself with certain sexual impressions. The thought of a _woman mortifying herself_ later on excited me sexually. Once, pulling a stay-string for fun (my wife never laced) gave me a powerful and quite unexpected erection.

"_Age 12_". A girl visitor of the same age got me talking about the genitals, and at bedtime came and proposed coitus. We failed to manage it. The vulva stripped back the foreskin, which was a voluptuous feeling; then we were alarmed by something and separated. I never saw her again. She too liked to 'punish' her vulva. She put whole pepper in it, and advised me to use the same. I continued greatly excited when she had gone; the hand flew to the phallus and worried it, and orgasm came on at once--the childish orgasm consisting of well-spaced spasms of the ejaculators, without the poignant preliminary nismus of the adult orgasm. There was no reaction or depression, except that the phallus--which did not subside at once--was painful to touch. A week or so later I tried again, but failed. A month later, being more excited, I succeeded. I found that I could only compass it about once in three weeks. There were no emissions. I used to have a spontaneous mental image of a small Grecian temple in a sunny park, which charmed me, and I had no scruples.

"_Age 12-13_". Masturbated once or twice a month.

"_Age 13-14_". Was sent to a small public school, where it happened that a very good tone prevailed. I learned that masturbation was bad form and unmanly. The proper thing was to save one's self up for women--at about 18. I dropped the practice easily, in spite of indulging my imagination about coitus. I thought of the initiation with prostitutes at 18, with the mixed feelings that even the most combative soldier must regard the fray. The hypogastric feeling above referred to would come on--which I liked and disliked at the same time. The first occasion on which I remember this feeling was when I got my first braces. Anything that harped on my sex produced it. Every time I received the sacrament, which I was forced to do very young, I repented of my intention of whoring at 18--as a man 'must' do--and afterward I relapsed to the expectation. Religion was a great reality to me, but it did not produce the radical effect that the development of the romantic sentiment did later on. (Both my wife and I became free-thinkers at about 30.)

"_Age 15-17_. Read poetry and romance. Conceived a high ideal of faithfulness and constancy. What a mockery all this loyalty is, I said to myself, if a man has stultified it beforehand. That was no mere castle-building. I had not understood what I was about in expecting to whore. The critical feelings were now awakening, and what they produced was revulsion against the abuse of sex, which got stronger every year. It became plain that there would be no whoring or the like for me; I was far too proud and fastidious. I neglected my tasks, which were uncongenial, and read a great deal of anatomy and physiology, which stood me in good stead later. As I rose in the school I was surprised to find the tone worse, but quite at the top it was better again, and with my latest companions sex was never even mentioned. At 14 I had a friend who importuned me to come into his bed, but I never would get under his bedclothes, for the male sex repels me powerfully in personal contact; he began to talk of masturbation, and now I can understand what he was aiming at. But my day-dreams of nymphs and dryads kept me in a state of perpetual tension, and erection was very frequent. The early morbid admiration of delicate women became replaced by admiration of health and strength combined with grace.

"_Age 17-18_. I was given a cubicle in which my neighbor on the right masturbated noisily two or three times a week, and the one on the left every night, using intermittent friction to drag it out longer. One night, kneeling at my bedside, saying prayers, my attention was divided between these and the occupation of my neighbor, when, after not having masturbated for four years,--the critical years of development,--the hand flew to the phallus and

" 'pulses pounding through palms and trembling
encircling fingers'

"procured, in Walt Whitman's language,

" 'the wholesome relief,--repose, content.'

"I slept well and had a sense of elation at the proof of manhood, for we boys were anxious about whether we secreted semen or not. The sexual obsession was tempered, and about three weeks later I had my first 'pollution'--the 'angel of the night,' as Mantegazza

with better sense calls it. From that time on I had pollutions every two or three weeks, with dreams sometimes of masturbation or of nymphs, or quite irrelevant matters. For a time these gave me perfect relief; then my 'dilectatio morosa' began to grow again, and the phallus would become so sensitive that working about on the belly would liberate the orgasm.

"_Age 18-19_. I had kept on persuading myself I was not masturbating--avoiding the use of the hand--but now I dropped this pretense, and frankly conceded the need to myself. I got done with it in a peremptory way and thought no more of it. I had no evil effects, moral or physical, and my mother would often compliment me on my bright appearance the morning after. At that time the appetite matured every seven to ten days, and, though I dreaded the idea of slavery to it, it would have been very hard to forego it. Headaches, which had begun to plague me from puberty on, grew rarer. Pollutions occurred in between, but were less effectual. I had up to this point accepted the incidental pleasure under a sort of protest; but now I got over that too and I allowed what I would prefer to call an idio-erotism (rather than an auto-erotism) its way, always picturing beautiful nymphs to myself. Surroundings of natural beauty moved me to this kind of reverie, partly perhaps because I had once secretly observed a lad basking naked on the sandy beach and toying with himself. The recollection is wholly unsullied to me. Happening on one occasion to check the stimulation about two-thirds way to orgasm, I experienced a miniature orgasm like the childish one, but with no declension of the tumescence, and I was able to repeat this maneuver several times before the full orgasm. This I later practised in _Coitus prolongatus_--giving the partner time to come up. I had already got into the way of poisoning the feeling on its climax. The ejaculator reflex, being habituated to this, seems to set in with its throbs when the maneuver is simulated, though no semen has yet been poured into the bulbous portion for the ejaculators to act upon. If this play be broken off before the critical spasm--as in the American 'Karezza,' etc.--there is no perceptible reaction, though an unsatisfied feeling remains. But when the act proceeds to emission and the poignant _undercurrent_ of feeling sets in that ushers the ejaculation and may only last two to five seconds, it makes all the difference, and constitutional signs appear--perspiration, etc. This leads to the question whether the critical sensation specially involves

the sympathetic nervous system? Up to that point the process is under control, but then automatic.

"An observation of practical importance to me at that time was this: I awoke in the morning after a pollution at night, with an acute headache of a specific kind, and erection. This had happened before, after pollution, and the erection suggested to me whether 'a hair of the dog that bit me' might not prove beneficial. As the excitation proceeded, the pain in the head was directly drained away, as if I were drawing it out. Other pain is also relieved for the moment, such as neuralgia, but to return soon with interest. This, however, was specific and pure benefit. The next time I got a bad headache of this character, without preceding pollution, I tried the remedy, at about 10 A.M. The semen was copious and watery, and the relief was marked, but in an hour's time the headache returned. I had never repeated the act at short interval, i.e., while the organs were under the influence of a previous act, and now I tried the effect of that. The second emission was also profuse, but much thicker, and the relief much greater. In about three hours the headache was, however, again intolerable, and, the connection being now clear, I ventured on a third act, which proved to be the most voluptuous I had so far experienced, the nusus being far more intense. The semen was copious, but thick and ropy, with lumps as large as small peas that could scarcely be crushed with the finger, and yellow in color and rank in odor. After that I was perfectly well and kept so. (The urethra was blocked so that I could with difficulty stroke the masses out.) Later I have examined such semen microscopically and found the spermatozoa dead and disintegrating. My period in my best years--21 to 48--was twice a week, the odd number being an inconvenience, and I have since endeavored to avoid accumulations, emptying the receptacles on the fourth day, when I remembered the interval, even if the organs did not remind me. On the fifth day headache would otherwise appear and perhaps two acts be needful, or, if I forgot about it for a week, three acts running. That I did not abuse the function the fact proves that every year I would forget about it two to three times and have to resort to this drastic mode.[230] But there is quite a different headache that follows on indulgence during convalescence or when the system is otherwise much lowered. Railway traveling greatly accentuates the need with me; also riding. Girls aroused no physical desire, though I

chiefly sought their society, and even after the genital tension was so pronounced, up to 20, I was troubled by the fact that women did not affect me sexually. About this time a buxom girl I liked and who liked me vehemently laid her hand on my arm, in trying to persuade me to give up shooting. The phallus leaped simultaneously. That was my first sexual experience--the proof that the nexus was established between the genital mechanism and the complex of feeling we call sexual.

"Age 24. At this age I went to stay at a house where there were two very pretty girls. I at once lost my heart to the elder, L.B., as she did to me (strong constitution, but refined nature; parents sound; brought up in the country; eleven months' breast-milk). 'What a mother she will make,' I said to myself. Now began a time of the spiritual and physical communion that I had pictured to myself....

"I am 60 now; she is 57. We are still like lovers. No; not like lovers; we are lovers. Of course, I do not mean to imply that sexual impressions have preponderated in our life, as they do in this account. Quite the contrary. We are both strong and, according to all accounts, unusually well preserved. We are very temperate. Since 48 I notice a gradual decline of the erotic propensity. It is now once in five or seven days. Since the menopause her propensity has declined markedly, but it is not extinct, and she delights as much as ever in my delight. She began to menstruate at 12, was regular till 17; then got chlorotic for a few months, soon recovered, though menstruation was often irregular, but never painful. Sexual experience began at 25. I have often wondered if a moderate self-gymnastic of the faculty, in Venturi's sense, would not have educated her genital sphere, and made her a still better comrade--excluded the periods of irregularity and frigidity. The stage of latency was too protracted. We often noticed that, when menstruation was due or nearly so, prolonged love-sports at bedtime would be followed by menstruation in the morning. We never were separated for longer than three months, and on that occasion, menstruation being delayed, she tried what masturbation would do to determine it, and with a positive result. My need, though less, is as imperative as ever. Seminal headaches--as I would call them--have ceased since 50; the accumulation only produces muddleheadedness. But I have not suffered accumulation over ten to at most twelve

days. The quantity of semen is also less. The sensibility of the corpora has declined much; that of the glans is unimpaired. Erection is good. Orgasm takes two to four minutes to provoke, against forty to fifty seconds when young; it is in some respects even more enjoyable--perhaps less intense, but much more prolonged. I have no reaction from indulgence. But I never press it; it always presses me. For overaccumulation, with headache or muddleheadedness, the wifely hand is more efficacious than the vulva. Even the most vivid dream of coitus fails to compass the orgasm now. The peripheral stimulus is essential.

"In our case physical and psychical intensity of emotion have gone hand in hand. I have become specialized to one woman, despite an erotic endowment certainly not meager. The pervasive fragrance makes one adore the whole sex, but my wife does not interpret this homage in a sexually promiscuous sense. We both agree in the principle that if one cannot hold the affection of the other there is no title to it. Tarde says that constancy in love is rarely anything but a voyage of discovery round the beloved object. I am perpetually making fresh discoveries. But her constancy, I mean the high level of her passion, is independent of discoveries."

FOOTNOTES:

[230] "A practical question arising out of the foregoing is whether such semen should be committed to the vagina? Its presence is known to me by constitutional symptoms (toxic). It is the last to be expelled, and its degenerate germ-cells have no chance against those of the normal fluid deposited in preceding acts, supposing that to be retained. But it may well happen that the prior emissions only reach the pouch, whereas the last is injected into the womb itself. I have frequently had the sense of the orifices of meatus and cervix matching directly, especially when she had powerful orgasm (including two conceptions), and of the semen being sucked from me rather than occluded in its exit, as also happens, requiring me to relax the urge a little. At 18 to 19 the semen of a 'pollution' has left tender red patches where it dried on the neighboring skin, and deep straw-colored stains in the linen."

STUDIES IN THE PSYCHOLOGY OF SEX, VOLUME IV

Sexual Selection In Man

I. Touch. Ii. Smell. Iii. Hearing. Iv. Vision.

by

HAVELOCK ELLIS

1927

PREFACE.

As in many other of these Studies, and perhaps more than in most, the task attempted in the present volume is mainly of a tentative and preliminary character. There is here little scope yet for the presentation of definite scientific results. However it may be in the physical universe, in the cosmos of science our knowledge must be nebulous before it constellates into definitely measurable shapes, and nothing is gained by attempting to anticipate the evolutionary process. Thus it is that here, for the most part, we have to content ourselves at present with the task of mapping out the field in broad and general outlines, bringing together the facts and considerations which indicate the direction in which more extended and precise results will in the future be probably found.

In his famous Descent of Man, wherein he first set forth the doctrine of sexual selection, Darwin injured an essentially sound principle by introducing into it a psychological confusion whereby the physiological sensory stimuli through which sexual selection operates were regarded as equivalent to æsthetic preferences. This confusion misled many, and it is only within recent years (as has been set forth in the "Analysis of the Sexual Impulse" in the previous volume of these Studies) that the

investigations and criticisms of numerous workers have placed the doctrine of sexual selection on a firm basis by eliminating its hazardous æsthetic element. Love springs up as a response to a number of stimuli to tumescence, the object that most adequately arouses tumescence being that which evokes love; the question of æsthetic beauty, although it develops on this basis, is not itself fundamental and need not even be consciously present at all. When we look at these phenomena in their broadest biological aspects, love is only to a limited extent a response to beauty; to a greater extent beauty is simply a name for the complexus of stimuli which most adequately arouses love. If we analyze these stimuli to tumescence as they proceed from a person of the opposite sex we find that they are all appeals which must come through the channels of four senses: touch, smell, hearing, and, above all, vision. When a man or a woman experiences sexual love for one particular person from among the multitude by which he or she is surrounded, this is due to the influences of a group of stimuli coming through the channels of one or more of these senses. There has been a sexual selection conditioned by sensory stimuli. This is true even of the finer and more spiritual influences that proceed from one person to another, although, in order to grasp the phenomena adequately, it is best to insist on the more fundamental and less complex forms which they assume. In this sense sexual selection is no longer a hypothesis concerning the truth of which it is possible to dispute; it is a self-evident fact. The difficulty is not as to its existence, but as to the methods by which it may be most precisely measured. It is fundamentally a psychological process, and should be approached from the psychological side. This is the reason for dealing with it here. Obscure as the psychological aspects of sexual selection still remain, they are full of fascination, for they reveal to us the more intimate sides of human evolution, of the process whereby man is molded into the shapes we know.

HAVELOCK ELLIS.

Lelant, Cornwall, England.

CONTENTS.

SEXUAL SELECTION IN MAN.

The External Sensory Stimuli Affecting Selection in Man. The Four Senses Involved.

TOUCH.

I.

The Primitive Character of the Skin. Its Qualities. Touch the Earliest Source of Sensory Pleasure. The Characteristics of Touch. As the Alpha and Omega of Affection. The Sexual Organs a Special Adaptation of Touch. Sexual Attraction as Originated by Touch. Sexual Hyperæsthesia to Touch. The Sexual Associations of Acne.

II.

Ticklishness. Its Origin and Significance. The Psychology of Tickling. Laughter. Laughter as a Kind of Detumescence. The Sexual Relationships of Itching. The Pleasure of Tickling. Its Decrease with Age and Sexual Activity.

III.

The Secondary Sexual Skin Centres. Orificial Contacts. Cunnilingus and Fellatio. The Kiss. The Nipples. The Sympathy of the Breasts with the Primary Sexual Centres. This Connection Operative both through the Nerves and through the Blood. The Influence of Lactation on the Sexual Centres. Suckling and Sexual Emotion. The Significance of the Association between Suckling and Sexual Emotion. The Association as a Cause of Sexual Perversity.

IV.

The Bath. Antagonism of Primitive Christianity to the Cult of the Skin. Its Cult of Personal Filth. The Reasons which Justified this Attitude. The World-wide Tendency to Association between Extreme Cleanliness and Sexual Licentiousness. The Immorality Associated with Public Baths in Europe down to Modern Times.

V.

Summary. Fundamental Importance of Touch. The Skin the Mother of All the Other Senses.

SMELL.

I.

The Primitiveness of Smell. The Anatomical Seat of the Olfactory Centres. Predominance of Smell among the Lower Mammals. Its Diminished Importance in Man. The Attention Paid to Odors by Savages.

II.

Rise of the Study of Olfaction. Cloquet. Zwaardemaker. The Theory of Smell. The Classification of Odors. The Special Characteristics of Olfactory Sensation in Man. Smell as the Sense of Imagination. Odors as Nervous Stimulants. Vasomotor and Muscular Effects. Odorous Substances as Drugs.

III.

The Specific Body Odors of Various Peoples. The Negro, etc. The European. The Ability to Distinguish Individuals by Smell. The Odor of Sanctity. The Odor of Death. The Odors of Different Parts of the Body. The Appearance of Specific Odors at Puberty. The Odors of Sexual Excitement. The Odors of Menstruation. Body Odors as a Secondary Sexual Character. The Custom of Salutation by Smell. The Kiss. Sexual Selection by Smell. The Alleged Association between Size of Nose and Sexual Vigor. The Probably Intimate Relationship between the Olfactory and Genital Spheres. Reflex Influences from the Nose. Reflex Influences from the Genital Sphere. Olfactory Hallucinations in Insanity as Related to Sexual States. The Olfactive Type. The Sense of Smell in Neurasthenic and Allied States. In Certain Poets and Novelists. Olfactory Fetichism. The Part Played by Olfaction in Normal Sexual Attraction. In the East, etc. In Modern Europe. The Odor of the Armpit and its Variations. As a Sexual and General Stimulant. Body Odors in Civilization Tend to Cause Sexual Antipathy unless some Degree of Tumescence is Already Present. The Question whether Men or Women are more Liable to Feel Olfactory Influences. Women Usually more Attentive to Odors. The Special Interest in Odors Felt by Sexual Inverts.

IV.

The Influence of Perfumes. Their Aboriginal Relationship to Sexual Body Odors. This True even of the Fragrance of Flowers. The Synthetic Manufacture of Perfumes. The Sexual Effects of Perfumes. Perfumes perhaps Originally Used to Heighten the Body Odors. The Special Significance of the Musk Odor. Its Wide Natural Diffusion in Plants and Animals and Man. Musk a Powerful Stimulant. Its Widespread Use as a Perfume. Peau d'Espagne. The Smell of Leather and its Occasional Sexual Effects. The Sexual Influence of the Odors of Flowers. The Identity of many Plant Odors with Certain Normal and Abnormal Body Odors. The Smell of Semen in this Connection.

V.

The Evil Effects of Excessive Olfactory Stimulation. The Symptoms of Vanillism. The Occasional Dangerous Results of the Odors of Flowers. Effects of Flowers on the Voice.

VI.

The Place of Smell in Human Sexual Selections. It has given Place to the Predominance of Vision largely because in Civilized Man it Fails to Act at a Distance. It still Plays a Part by Contributing to the Sympathies or the Antipathies of Intimate Contact.

HEARING

I.

The Physiological Basis of Rhythm. Rhythm as a Physiological Stimulus. The Intimate Relation of Rhythm to Movement. The Physiological Influence of Music on Muscular Action, Circulation, Respiration, etc. The Place of Music in Sexual Selection among the Lower Animals. Its Comparatively Small Place in Courtship among Mammals. The Larynx and Voice in Man. The Significance of the Pubertal Changes. Ancient Beliefs Concerning the Influence of Music in Morals, Education and Medicine. Its Therapeutic Uses. Significance of the Romantic Interest in Music at Puberty. Men Comparatively Insusceptible to the Specifically Sexual Influence of Music. Rarity of Sexual Perversions on the Basis of the Sense of Hearing. The

Part of Music in Primitive Human Courtship. Women Notably Susceptible to the Specifically Sexual Influence of Music and the Voice.

II.

Summary. Why the Influence of Music in Human Sexual Selection is Comparatively Small.

VISION.

I.

Primacy of Vision in Man. Beauty as a Sexual Allurement. The Objective Element in Beauty. Ideals of Feminine Beauty in Various Parts of the World. Savage Women sometimes Beautiful from European Point of View. Savages often Admire European Beauty. The Appeal of Beauty to some Extent Common even to Animals and Man.

II.

Beauty to Some Extent Consists Primitively in an Exaggeration of the Sexual Characters. The Sexual Organs. Mutilations, Adornments, and Garments. Sexual Allurement the Original Object of Such Devices. The Religious Element. Unæsthetic Character of the Sexual Organs. Importance of the Secondary Sexual Characters. The Pelvis and Hips. Steatopygia. Obesity. Gait. The Pregnant Woman as a Mediæval Type of Beauty. The Ideals of the Renaissance. The Breasts. The Corset. Its Object. Its History. Hair. The Beard. The Element of National or Racial Type in Beauty. The Relative Beauty of Blondes and Brunettes. The General European Admiration for Blondes. The Individual Factors in the Constitution of the Idea of Beauty. The Love of the Exotic.

III.

Beauty Not the Sole Element in the Sexual Appeal of Vision. Movement. The Mirror. Narcissism. Pygmalionism. Mixoscopy. The Indifference of Women to Male Beauty. The Significance of Woman's Admiration of Strength. The Spectacle of Strength is a Tactile Quality made Visible.

IV.

The Alleged Charm of Disparity in Sexual Attraction. The Admiration for High Stature. The Admiration for Dark Pigmentation. The Charm of Parity. Conjugal Mating. The Statistical Results of Observation as Regards General Appearance, Stature, and Pigmentation of Married Couples. Preferential Mating and Assortative Mating. The Nature of the Advantage Attained by the Fair in Sexual Selection. The Abhorrence of Incest and the Theories of its Cause. The Explanation in Reality Simple. The Abhorrence of Incest in Relation to Sexual Selection. The Limits to the Charm of Parity in Conjugal Mating. The Charm of Disparity in Secondary Sexual Characters.

V.

Summary of the Conclusions at Present Attainable in Regard to the Nature of Beauty and its Relation to Sexual Selection.

APPENDIX A.

The Origins of the Kiss.

APPENDIX B.

Histories of Sexual Development.

SEXUAL SELECTION IN MAN.

The External Sensory Stimuli Affecting Selection in Man--The Four Senses Involved.

Tumescence--the process by which the organism is brought into the physical and psychic state necessary to insure conjugation and detumescence--to some extent comes about through the spontaneous action of internal forces. To that extent it is analogous to the physical and psychic changes which accompany the gradual filling of the bladder and precede its evacuation. But even among animals who are by no means high in the zoölogical scale the process is more complicated than this. External stimuli act at every stage, arousing or heightening the process of tumescence, and in normal

human beings it may be said that the process is never completed without the aid of such stimuli, for even in the auto-erotic sphere external stimuli are still active, either actually or in imagination.

The chief stimuli which influence tumescence and thus direct sexual choice come chiefly--indeed, exclusively--through the four senses of touch, smell, hearing, and sight. All the phenomena of sexual selection, so far as they are based externally, act through these four senses.[1] The reality of the influence thus exerted may be demonstrated statistically even in civilized man, and it has been shown that, as regards, for instance, eye-color, conjugal partners differ sensibly from the unmarried persons by whom they are surrounded. When, therefore, we are exploring the nature of the influence which stimuli, acting through the sensory channels, exert on the strength and direction of the sexual impulse, we are intimately concerned with the process by which the actual form and color, not alone of living things generally, but of our own species, have been shaped and are still being shaped. At the same time, it is probable, we are exploring the mystery which underlies all the subtle appreciations, all the emotional undertones, which are woven in the web of the whole world as it appeals to us through those sensory passages by which alone it can reach us. We are here approaching, therefore, a fundamental subject of unsurpassable importance, a subject which has not yet been accurately explored save at a few isolated points and one which it is therefore impossible to deal with fully and adequately. Yet it cannot be passed over, for it enters into the whole psychology of the sexual instinct.

Of the four senses--touch, smell, hearing, and sight--with which we are here concerned, touch is the most primitive, and it may be said to be the most important, though it is usually the last to make its appeal felt. Smell, which occupies the chief place among many animals, is of comparatively less importance, though of considerable interest, in man; it is only less intimate and final than touch. Sight occupies an intermediate position, and on this account, and also on account of the very great part played by vision in life generally as well as in art, it is the most important of all the senses from the human sexual point of view. Hearing, from the same point of view, is the most remote of all the senses in its appeal to the sexual impulse, and on that account it is, when it intervenes, among the first to make its influence felt.

FOOTNOTES:

[1] Taste must, I believe, be excluded, for if we abstract the parts of touch and smell, even in those abnormal sexual acts in which it may seem to be affected, taste could scarcely have any influence. Most of our "tasting," as Waller puts it, is done by the nose, which, in man, is in specially close relationship, posteriorly, with the mouth. There are at most four taste sensations--sweet, bitter, salt, and sour--if even all of these are simple tastes. What commonly pass for taste sensations, as shown by some experiments of G.T.W. Patrick (Psychological Review, 1898, p. 160), are the composite results of the mingling of sensations of smell, touch, temperature, sight, and taste.

TOUCH.

I.

The Primitive Character of the Skin--Its Qualities--Touch the Earliest Source of Sensory Pleasure--The Characteristics of Touch--As the Alpha and Omega of Affection--The Sexual Organs a Special Adaptation of Touch--Sexual Attraction as Originated by Touch--Sexual Hyperæsthesia to Touch--The Sexual Associations of Acne.

We are accustomed to regard the skin as mainly owing its existence to the need for the protection of the delicate vessels, nerves, viscera, and muscles underneath. Undoubtedly it performs, and by its tough and elastic texture is well fitted to perform, this extremely important service. But the skin is not merely a method of protection against the external world; it is also a method of bringing us into sensitive contact with the external world. It is thus, as the organ of touch, the seat of the most widely diffused sense we possess, and, moreover, the sense which is the most ancient and fundamental of all--the mother of the other senses.

It is scarcely necessary to insist that the primitive nature of the sensory function of the skin with the derivative nature of the other senses, is a well ascertained and demonstrable fact. The lower we descend in the animal scale, the more varied we find the functions of the skin to be, and if in the higher animals much of the complexity has disappeared, that is only because the specialization of the various skin regions into distinct organs has rendered this complexity unnecessary. Even yet,

however, in man himself the skin still retains, in a more or less latent condition, much of its varied and primary power, and the analysis of pathological and even normal phenomena serves to bring these old powers into clear light.

Woods Hutchinson (_Studies in Human and Comparative Pathology_, 1901, Chapters VII and VIII) has admirably set forth the immense importance of the skin, as in the first place "a tissue which is silk to the touch, the most exquisitely beautiful surface in the universe to the eye, and yet a wall of adamant against hostile attack. Impervious alike, by virtue of its wonderful responsive vitality, to moisture and drought, cold and heat, electrical changes, hostile bacteria, the most virulent of poisons and the deadliest of gases, it is one of the real Wonders of the World. More beautiful than velvet, softer and more pliable than silk, more impervious than rubber, and more durable under exposure than steel, well-nigh as resistant to electric currents as glass, it is one of the toughest and most dangerproof substances in the three kingdoms of nature" (although, as this author adds, we "hardly dare permit it to see the sunlight or breathe the open air"). But it is more than this. It is, as Woods Hutchinson expresses it, the creator of the entire body; its embryonic infoldings form the alimentary canal, the brain, the spinal cord, while every sense is but a specialization of its general organic activity. It is furthermore a kind of "skin-heart," promoting the circulation by its own energy; it is the great heat-regulating organ of the body; it is an excretory organ only second to the kidneys, which descend from it, and finally it still remains the seat of touch.

It may be added that the extreme beauty of the skin as a surface is very clearly brought out by the inadequacy of the comparisons commonly used in order to express its beauty. Snow, marble, alabaster, ivory, milk, cream, silk, velvet, and all the other conventional similes furnish surfaces which from any point of view are incomparably inferior to the skin itself. (Cf. Stratz, _Die Schönheit des Weiblichen Körpers_, Chapter XII.)

With reference to the extraordinary vitality of the skin, emphasized by Woods Hutchinson, it may be added that, when experimenting on the skin with the electric current, Waller found that healthy skin showed signs of life ten days or more after

excision. It has been found also that fragments of skin which have been preserved in sterile fluid for even as long as nine months may still be successfully transplanted on to the body. (British Medical Journal, July 19, 1902.)

Everything indicates, remark Stanley Hall and Donaldson ("Motor Sensations in the Skin," Mind, 1885), that the skin is "not only the primeval and most reliable source of our knowledge of the external world or the archæological field of psychology," but a field in which work may shed light on some of the most fundamental problems of psychic action. Groos (Spiele der Menschen, pp. 8-16) also deals with the primitive character of touch sensations.

Touch sensations are without doubt the first of all the sensory impressions to prove pleasurable. We should, indeed, expect this from the fact that the skin reflexes have already appeared before birth, while a pleasurable sensitiveness of the lips is doubtless a factor in the child's response to the contact of the maternal nipple. Very early memories of sensory pleasure seem to be frequently, perhaps most frequently, tactile in character, though this fact is often disguised in recollection, owing to tactile impression being vague and diffused; there is thus in Elizabeth Potwin's "Study of Early Memories" (Psychological Review, November, 1901) no separate group of tactile memories, and the more elaborate investigation by Colegrove ("Individual Memories," American Journal of Psychology, January, 1899) yields no decisive results under this head. See, however, Stanley Hall's valuable study, "Some Aspects of the Early Sense of Self," American Journal of Psychology, April, 1898. Külpe has a discussion of the psychology of cutaneous sensations (Outlines of Psychology [English translation], pp. 87 et seq.)

Harriet Martineau, at the beginning of her Autobiography, referring to the vivid character of tactile sensations in early childhood, remarks, concerning an early memory of touching a velvet button, that "the rapture of the sensation was really monstrous." And a lady tells me that one of her earliest memories at the age of 3 is of the exquisite sensation of the casual contact of a cool stone with the vulva in the act of urinating. Such sensations, of course, cannot be termed specifically sexual, though they help to furnish the tactile basis on which the

specifically sexual sensations develop.

The elementary sensitiveness of the skin is shown by the fact that moderate excitation suffices to raise the temperature, while Heidenhain and others have shown that in animals cutaneous stimuli modify the sensibility of the brain cortex, slight stimulus increasing excitability and strong stimulus diminishing it. Féré has shown that the slight stimulus to the skin furnished by placing a piece of metal on the arm or elsewhere suffices to increase the output of work with the ergograph. (Féré, *Comptes Rendus Société de Biologie*, July 12, 1902; id., *Pathologic des Emotions*, pp. 40 et seq.)

Féré found that the application of a mustard plaster to the skin, or an icebag, or a hot-water bottle, or even a light touch with a painter's brush, all exerted a powerful effect in increasing muscular work with the ergograph. "The tonic effect of cutaneous excitation," he remarks, "throws light on the psychology of the caress. It is always the most sensitive parts of the body which seek to give or to receive caresses. Many animals rub or lick each other. The mucous surfaces share in this irritability of the skin. The kiss is not only an expression of feeling; it is a means of provoking it. Cataglottism is by no means confined to pigeons. The tonic value of cutaneous stimulation is indeed a commonly accepted idea. Wrestlers rub their hands or limbs, and the hand-shake also is not without its physiological basis.

"Cutaneous excitations may cause painful sensations to cease. Many massage practices which favor work act chiefly as sensorial stimulants; on this account many nervous persons cannot abandon them, and the Greeks and Romans found in massage not only health, but pleasure. Lauder Brunton regards many common manoeuvres, like scratching the head and pulling the mustache, as methods of dilating the bloodvessels of the brain by stimulating the facial nerve. The motor reactions of cutaneous excitations favor this hypothesis." (Féré, *Travail et Plaisir*, Chapter XV, "Influence des Excitations du Toucher sur le Travail.")

The main characteristics of the primitive sense of touch are its wide diffusion over the whole body and the massive vagueness and imprecision of the messages it sends to the brain. This is the reason, why it is, of all the senses, the least intellectual and the least æsthetic; it is also the

reason why it is, of all the senses, the most-profoundly emotional. "Touch," wrote Bain in his Emotions and Will, "is both the alpha and the omega of affection," and he insisted on the special significance in this connection of "tenderness"--a characteristic emotional quality of affection which is directly founded on sensations of touch. If tenderness is the alpha of affection, even between the sexes, its omega is to be found in the sexual embrace, which may be said to be a method of obtaining, through a specialized organization of the skin, the most exquisite and intense sensations of touch.

"We believe nothing is so exciting to the instinct or mere passions as the presence of the hand or those tactile caresses which mark affection," states the anonymous author of an article on "Woman in her Psychological Relations," in the Journal of Psychological Medicine, 1851. "They are the most general stimuli in lower animals. The first recourse in difficulty or danger, and the primary solace in anguish, for woman is the bosom of her husband or her lover. She seeks solace and protection and repose on that part of the body where she herself places the objects of her own affection. Woman appears to have the same instinctive impulse in this respect all over the world."

It is because the sexual orgasm is founded on a special adaptation and intensification of touch sensations that the sense of touch generally is to be regarded as occupying the very first place in reference to the sexual emotions. Féré, Mantegazza, Penta, and most other writers on this question are here agreed. Touch sensations constitute a vast gamut for the expression of affection, with at one end the note of minimum personal affection in the brief and limited touch involved by the conventional hand-shake and the conventional kiss, and at the other end the final and intimate contact in which passion finds the supreme satisfaction of its most profound desire. The intermediate region has its great significance for us because it offers a field in which affection has its full scope, but in which every road may possibly lead to the goal of sexual love. It is the intimacy of touch contacts, their inevitable approach to the threshold of sexual emotion, which leads to a jealous and instinctive parsimony in the contact of skin and skin and to the tendency with the increased sensitiveness of the nervous system involved by civilization to restrain even the conventional touch manifestation of ordinary affection and esteem. In China fathers leave off kissing their daughters while they are still young children. In England the kiss as an ordinary greeting between men and women--a custom inherited from classic and early Christian

antiquity--still persisted to the beginning of the eighteenth century. In France the same custom existed in the seventeenth century, but in the middle of that century was beginning to be regarded as dangerous,[2] while at the present time the conventional kiss on the cheek is strictly differentiated from the kiss on the mouth, which is reserved for lovers. Touch contacts between person and person, other than those limited and defined by custom, tend to become either unpleasant--as an undesired intrusion into an intimate sphere--or else, when occurring between man and woman at some peculiar moment, they may make a powerful reverberation in the emotional and more specifically sexual sphere. One man falls in love with his future wife because he has to carry her upstairs with a sprained ankle. Another dates his love-story from a romp in which his cheek accidentally came in contact with that of his future wife. A woman will sometimes instinctively strive to attract the attention of the man who appeals to her by a peculiar and prolonged pressure of the hand--the only touch contact permitted to her. Dante, as Penta has remarked, refers to "sight or touch" as the two channels through which a woman's love is revived (*_Purgatorio_*, VIII, 76). Even the hand-shake of a sympathetic man is enough in some chaste and sensitive women to produce sexual excitement or sometimes even the orgasm. The cases in which love arises from the influence of stimuli coming through the sense of touch are no doubt frequent, and they would be still more frequent if it were not that the very proximity of this sense to the sexual sphere causes it to be guarded with a care which in the case of the other senses it is impossible to exercise. This intimacy of touch and the reaction against its sexual approximations leads to what James has called "the *_antisexual instinct_*, the instinct of personal isolation, the actual repulsiveness to us of the idea of intimate contact with most of the persons we meet, especially those of our own sex." He refers in this connection to the unpleasantness of the sensation felt on occupying a seat still warm from the body of another person.[3] The Catholic Church has always recognized the risks of voluptuous emotion involved in tactile contacts, and the facility with which even the most innocent contacts may take on a libidinous character.[4]

The following observations were written by a lady (aged 30) who has never had sexual relationships: "I am only conscious of a very sweet and pleasurable emotion when coming in contact with honorable men, and consider that a comparison can be made between the idealism of such emotions and those of music, of beauties of Nature, and of productions of art. While studying and writing articles upon a new subject I came in contact with a specialist,

who rendered me considerable aid, and, one day, while jointly correcting a piece of work, he touched my hand. This produced a sweet and pure sensation of thrill through the whole system. I said nothing; in fact, was too thrilled for speech; and never to this day have shown any responsive action, but for months at certain periods, generally twice a month, I have experienced the most pleasurable emotions. I have seen this friend twice since, and have a curious feeling that I stand on one side of a hedge, while he is on the other, and, as neither makes an approach, pleasure of the highest kind is experienced, but not allowed to go beyond reasonable and health-giving bounds. In some moments I feel overcome by a sense of mastery by this man, and yet, feeling that any approach would be undignified, some pleasure is experienced in restraining and keeping within proper bounds this passional emotion. All these thrills of pleasurable emotion possess a psychic value, and, so long as the nervous system is kept in perfect health, they do not seem to have the power to injure, but rather one is able to utilize the passionate emotions as weapons for pleasure and work."

Various parts of the skin surface appear to have special sexual sensitiveness, peculiarly marked in many individuals, especially women; so that, as Féré remarks (*L'Instinct Sexuel*, second edition, 1902, p. 130), contact stimulation of the lips, lobe of ear, nape of neck, little finger, knee, etc., may suffice even to produce the orgasm. Some sexually hyperæsthetic women, as has already been noted, experience this when shaking hands with a man who is attractive to them. In some neurotic persons this sensibility, as Féré shows, may exist in so morbid a degree that even the contact of the sensitive spot with unattractive persons or inanimate objects may produce the orgasm. In this connection reference may be made to the well-known fact that in some hysterical subjects there are so-called "erogenous zones" simple pressure on which suffices to evoke the complete orgasm. There is, perhaps, some significance, from our present point of view, in the fact that, as emphasized by Savill (*"Hysterical Skin Symptoms," Lancet*, January 30, 1904), the skin is one of the very best places to study hysteria.

The intimate connection between the skin and the sexual sphere is also shown in pathological conditions of the skin, especially in acne as well as simple pimples on the face. The sexual

development of puberty involves a development of hair in various regions of the body which previously were hairless. As, however, the sebaceous glands on the face and elsewhere are the vestiges of former hairs and survive from a period when the whole body was hairy, they also tend to experience in an abortive manner this same impulse. Thus, we may say that, with the development of the sexual organs at puberty, there is correlated excitement of the whole pilo-sebaceous apparatus. In the regions where this apparatus is vestigial, and notably in the face, this abortive attempt of the hair-follicles and their sebaceous appendages to produce hairs tends only to disorganization, and simple comedones or pustular acne pimples are liable to occur. As a rule, acne appears about puberty and dies out slowly during adolescence. While fairly common in young women, it is usually much less severe, but tends to be exacerbated at the menstrual periods; it is also apt to appear at the change of life. (Stephen Mackenzie, "The Etiology and Treatment of Acne Vulgaris," British Medical Journal, September 29, 1894. Laycock [Nervous Diseases of Women, 1840, p. 23] pointed out that acne occurs chiefly in those parts of the surface covered by sexual hair. A lucid account of the origin of acne will be found in Woods Hutchinson's Studies in Human and Comparative Pathology, pp. 179-184. G.J. Engelmann ["The Hystero-neuroses," Gynaecological Transactions, 1887, pp. 124 et seq.] discusses various pathological disorders of the skin as reflex disturbances originating in the sexual sphere.)

The influence of menstruation in exacerbating acne has been called in question, but it seems to be well established. Thus, Bulkley ("Relation between Certain Diseases of the Skin and the Menstrual Function," Transactions of the Medical Society of New York, 1901, p. 328) found that, in 510 cases of acne in women, 145, or nearly one-third, were worse about the monthly period. Sometimes it only appeared during menstruation. The exacerbation occurred much more frequently just before than just after the period. There was usually some disturbance of menstruation. Various other disorders of the skin show a similar relationship to menstruation.

It has been asserted that masturbation is a frequent or constant cause of acne at puberty. (See, e.g., discussion in British Medical Journal, July, 1882.) This cannot be accepted. Acne very

frequently occurs without masturbation, and masturbation is very frequently practiced without producing acne. At the same time we may well believe that at the period of puberty, when the pilo-sebaceous system is already in sensitive touch with the sexual system, the shock of frequently repeated masturbation may (in the same way as disordered menstruation) have its repercussion on the skin. Thus, a lady has informed me that at about the age of 18 she found that frequently repeated masturbation was followed by the appearance of _comedones_.

Ticklishness--Its Origin and Significance--The Psychology of Tickling--Laughter--Laughter as a Kind of Detumescence--The Sexual Relationships of Itching--The Pleasure of Tickling--Its Decrease with Age and Sexual Activity.

Touch, as has already been remarked, is the least intellectual of the senses. There is, however, one form of touch sensation--that is to say, ticklishness--which is of so special and peculiar a nature that it has sometimes been put aside in a class apart from all other touch sensations. Scaliger proposed to class titillation as a sixth, or separate, sense. Alrutz, of Upsala, regards tickling as a milder degree of itching, and considers that the two together constitute a sensation of distinct quality with distinct end-organs, for the mediation of that quality.[5] However we may regard this extreme view, tickling is certainly a specialized modification of touch and it is at the same time the most intellectual mode of touch sensation and that with the closest connection with the

sexual sphere. To regard tickling as an intellectual manifestation may cause surprise, more especially when it is remembered that ticklishness is a form of sensation which reaches full development very early in life, and it has to be admitted that, as compared even with the messages that may be sent through smell and taste, the intellectual element in ticklishness remains small. But its presence here has been independently recognized by various investigators. Groos points out the psychic factor in tickling as evidenced by the impossibility of self-tickling.[6] Louis Robinson considers that ticklishness "appears to be one of the simplest developments of mechanical and automatic nervous processes in the direction of the complex functioning of the higher centres which comes within the scope of psychology,"[7] Stanley Hall and Allin remark that "these minimal touch excitations represent the very oldest stratum of psychic life in the soul."[8] Hirman Stanley, in a somewhat similar manner, pushes the intellectual element in ticklishness very far back and associates it with "tentacular experience." "By temporary self-extension," he remarks, "even low amoeboid organisms have slight, but suggestive, touch experiences that stimulate very general and violent reactions, and in higher organisms extended touch-organs, as tentacles, antennæ, hair, etc., become permanent and very delicately sensitive organs, where minimal contacts have very distinct and powerful reactions." Thus ticklishness would be the survival of long passed ancestral tentacular experience, which, originally a stimulation producing intense agitation and alarm, has now become merely a play activity and a source of keen pleasure.[9]

We need not, however, go so far back in the zoölogical series to explain the origin and significance of tickling in the human species. Sir J.Y. Simpson suggested, in an elaborate study of the position of the child in the womb, that the extreme excitomotory sensibility of the skin in various regions, such as the sole of the foot, the knee, the sides, which already exists before birth, has for its object the excitation and preservation of the muscular movements necessary to keep the foetus in the most favorable position in the womb.[10] It is, in fact, certainly the case that the stimulation of all the ticklish regions in the body tends to produce exactly that curled up position of extreme muscular flexion and general ovoid shape which is the normal position of the foetus in the womb. We may well believe that in this early developed reflex activity we have the basis of that somewhat more complex ticklishness which appears somewhat later.

The mental element in tickling is indicated by the fact that even a child, in whom ticklishness is highly developed, cannot tickle himself; so that

tickling is not a simple reflex. This fact was long ago pointed out by Erasmus Darwin, and he accounted for it by supposing that voluntary exertion diminishes the energy of sensation.[11] This explanation is, however, inadmissible, for, although we cannot easily tickle ourselves by the contact of the skin with our own fingers, we can do so with the aid of a foreign body, like a feather. We may perhaps suppose that, as ticklishness has probably developed under the influence of natural selection as a method of protection against attack and a warning of the approach of foreign bodies, its end would be defeated if it involved a simple reaction to the contact of the organism with itself. This need of protection it is which involves the necessity of a minimal excitation producing a maximal effect, though the mechanism whereby this takes place has caused considerable discussion. We may, it is probable, best account for it by invoking the summation-irradiation theory of pain-pleasure, the summation of the stimuli in their course through the nerves, aided by capillary congestion, leading to irradiation due to anastomoses between the tactile corpuscles, not to speak of the much wider irradiation which is possible by means of central nervous connections.

Prof. C.L. Herrick adopts this explanation of the phenomena of tickling, and rests it, in part, on Dogiel's study of the tactile corpuscles ("Psychological Corollaries of Modern Neurological Discoveries," *Journal of Comparative Neurology*, March, 1898). The following remarks of Prof. A. Allin may also be quoted in further explanation of the same theory: "So far as ticklishness is concerned, a very important factor in the production of this feeling is undoubtedly that of the summation of stimuli. In a research of Stirling's, carried on under Ludwig's direction, it was shown that reflex contractions only occur from repeated shocks to the nerve-centres--that is, through summation of successive stimuli. That this result is also due in some degree to an alternating increase in the sensibility of the various areas in question from altered supply of blood is reasonably certain. As a consequence of this summation-process there would result in many cases and in cases of excessive nervous discharge the opposite of pleasure, namely: pain. A number of instances have been recorded of death resulting from tickling, and there is no reason to doubt the truth of the statement that Simon de Montfort, during the persecution of the Albigenses, put some of them to death by tickling the soles of their feet with a feather. An additional causal factor in the production of tickling may lie in the nature and structure of the nervous process involved in

perception in general. According to certain histological researches of recent years we know that between the sense-organs and the central nervous system there exist closely connected chains of conductors or neurons, along which an impression received by a single sensory cell on the periphery is propagated avalanchelike through an increasing number of neurons until the brain is reached. If on the periphery a single cell is excited the avalanchelike process continues until finally hundreds or thousands of nerve-cells in the cortex are aroused to considerable activity. Golgi, Ramón y Cajal, Koelliker, Held, Retzius, and others have demonstrated the histological basis of this law for vision, hearing, and smell, and we may safely assume from the phenomena of tickling that the sense of touch is not lacking in a similar arrangement. May not a suggestion be offered, with some plausibility, that even in ideal or representative tickling, where tickling results, say, from someone pointing a finger at the ticklish places, this avalanchelike process may be incited from central centres, thus producing, although in a modified degree, the pleasant phenomena in question? As to the deepest causal factor, I should say that tickling is the result of vasomotor shock." (A. Allin, "On Laughter," Psychological Review, May, 1903.)

The intellectual element in tickling conies out in its connection with laughter and the sense of the comic, of which it may be said to constitute the physical basis. While we are not here concerned with laughter and the comic sense,--a subject which has lately attracted considerable attention,--it may be instructive to point out that there is more than an analogy between laughter and the phenomena of sexual tumescence and detumescence. The process whereby prolonged tickling, with its nervous summation and irradiation and accompanying hyperæmia, finds sudden relief in an explosion of laughter is a real example of tumescence--as it has been defined in the study in another volume entitled "An Analysis of the Sexual Impulse"--resulting finally in the orgasm of detumescence. The reality of the connection between the sexual embrace and tickling is indicated by the fact that in some languages, as in that of the Fuegians,[12] the same word is applied to both. That ordinary tickling is not sexual is due to the circumstances of the case and the regions to which the tickling is applied. If, however, the tickling is applied within the sexual sphere, then there is a tendency for orgasm to take place instead of laughter. The connection which, through the phenomena of tickling, laughter thus bears to the sexual sphere is well indicated, as

Groos has pointed out, by the fact that in sexually-minded people sexual allusions tend to produce laughter, this being the method by which they are diverted from the risks of more specifically sexual detumescence.[13]

Reference has been made to the view of Alrutz, according to which tickling is a milder degree of itching. It is more convenient and probably more correct to regard itching or pruritus, as it is termed in its pathological forms, as a distinct sensation, for it does not arise under precisely the same conditions as tickling nor is it relieved in the same way. There is interest, however, in pointing out in this connection that, like tickling, itching has a real parallelism to the specialized sexual sensations. Bronson, who has very ably interpreted the sensations of itching (New York Neurological Society, October 7, 1890; *_Medical News_*, February 14, 1903, and summarized in the *_British Medical Journal_*, March 7, 1903; and elsewhere), regards it as a perversion of the sense of touch, a dysæsthesia due to obstructed nerve-excitation with imperfect conduction of the generated force into correlated nervous energy. The scratching which relieves itching directs the nervous energy into freer channels, sometimes substituting for the pruritus either painful or voluptuous sensations. Such voluptuous sensations may be regarded as a generalized aphrodisiac sense comparable to the specialized sexual orgasm. Bronson refers to the significant fact that itching occurs so frequently in the sexual region, and states that sexual neurasthenia is sometimes the only discoverable cause of genital and anal pruritus. (Cf. discussion on pruritus, *_British Medical Journal_*, November 30, 1895.) Gilman, again (*_American Journal of Psychology_*, vi, p. 22), considers that scratching, as well as sneezing, is comparable to coitus.

The sexual embrace has an intimate connection with the phenomena of ticklishness which could not fail to be recognized. This connection is, indeed, the basis of Spinoza's famous definition of love,--"*_Amor est titillatio quædam concomitante idea causæ externæ_*,"--a statement which seems to be reflected in Chamfort's definition of love as "*_l'échange de deux fantaisies, et le contact de deux epidermes_*." The sexual act, says Gowers, is, in fact, a skin reflex.[14] "The sexual parts," Hall and Allin state, "have a ticklishness as unique as their function and as keen as their importance." Herrick finds the supreme illustration of the summation and irradiation theory of tickling in the phenomena of erotic excitement, and points out that in harmony with this the skin of the sexual region is,

as Dogiel has shown, that portion of the body in which the tactile corpuscles are most thoroughly and elaborately provided with anastomosing fibres. It has been pointed out[15] that, when ordinary tactile sensibility is partially abolished,--especially in hemianæsthesia in the insane,--some sexual disturbance is specially apt to be found in association.

In young children, in girls even when they are no longer children, and occasionally in men, tickling may be a source of acute pleasure, which in very early life is not sexual, but later tends to become so under circumstances predisposing to the production of erotic emotion, and especially when the nervous system is keyed up to a high tone favorable for the production of the maximum effect of tickling.

"When young," writes a lady aged 28, "I was extremely fond of being tickled, and I am to some extent still. Between the ages of 10 and 12 it gave me exquisite pleasure, which I now regard as sexual in character. I used to bribe my younger sister to tickle my feet until she was tired."

Stanley Hall and Allin in their investigation of the phenomena of tickling, largely carried out among young women teachers, found that in 60 clearly marked cases ticklishness was more marked at one time than another, "as when they have been 'carrying on,' or are in a happy mood, are nervous or unwell, after a good meal, when being washed, when in perfect health, when with people they like, etc." (Hall and Allin, "Tickling and Laughter," *American Journal of Psychology*, October, 1897.) It will be observed that most of the conditions mentioned are such as would be favorable to excitations of an emotionally sexual character.

The palms of the hands may be very ticklish during sexual excitement, especially in women, and Moll (*Konträre Sexualempfindung*, p. 180) remarks that in some men titillation of the skin of the back, of the feet, and even of the forehead evokes erotic feelings.

It may be added that, as might be expected, titillation of the skin often has the same significance in animals as in man. "In some animals," remarks Louis Robinson (art. "Ticklishness," *Dictionary of Psychological Medicine*), "local titillation of the skin, though in parts remote from the reproductive organs,

plainly acts indirectly upon them as a stimulus. Thus, Harvey records that, by stroking the back of a favorite parrot (which he had possessed for years and supposed to be a male), he not only gave the bird gratification,--which was the sole intention of the illustrious physiologist,--but also caused it to reveal its sex by laying an egg."

The sexual significance of tickling is very clearly indicated by the fact that the general ticklishness of the body, which is so marked in children and in young girls, greatly diminishes, as a rule, after sexual relationships have been established. Dr. Gina Lombroso, who investigated the cutaneous reflexes, found that both the abdominal and plantar reflexes, which are well marked in childhood and in young people between the ages of 15 and 18, were much diminished in older persons, and to a greater extent in women than in men, to a greater extent in the abdominal region than on the soles of the feet;[16] her results do not directly show the influence of sexual relationship, but they have an indirect bearing which is worth noting.

The difference in ticklishness between the unmarried woman and the married woman corresponds to their difference in degree of modesty. Both modesty and ticklishness may be said to be characters which are no longer needed. From this point of view the general ticklishness of the skin is a kind of body modesty. It is so even apart from any sexual significance of tickling, and Louis Robinson has pointed out that in young apes, puppies, and other like animals the most ticklish regions correspond to the most vulnerable spots in a fight, and that consequently in the mock fights of early life skill in defending these spots is attained.

In Iceland, according to Margarethe Filh s (as quoted by Max Bartels, *Zeitschrift f r Ethnologie*, 1900, ht. 2-3, p. 57), it may be known whether a youth is pure or a maid is intact by their susceptibility to tickling. It is considered a bad sign if that is lost.

I am indebted to a medical correspondent for the following communication: "Married women have told me that they find that after marriage they are not ticklish under the arms or on the breasts, though before marriage any tickling or touching in these regions, especially by a man, would make them jump or get hysterical or 'queer,' as they call it. Before coitus the sexual energy seems to be dissipated along all the nerve-channels and

especially along the secondary sexual routes,--the breasts, nape of neck, eyebrows, lips, cheeks, armpits, and hair thereon, etc.,--but after marriage the surplus energy is diverted from these secondary channels, and response to tickling is diminished. I have often noted in insane cases, especially mania in adolescent girls, that they are excessively ticklish. Again, in ordinary routine practice I have observed that, though married women show no ticklishness during auscultation and percussion of the chest, this is by no means always so in young girls. Perhaps ticklishness in virgins is Nature's self-protection against rape and sexual advances, and the young girl instinctively wishing to hide the armpits, breasts, and other ticklish regions, tucks herself up to prevent these parts being touched. The married woman, being in love with a man, does not shut up these parts, as she reciprocates the advances that he makes; she no longer requires ticklishness as a protection against sexual aggression."

III.

The Secondary Sexual Skin Centres--Orificial Contacts--Cunnilingus and Fellatio--The Kiss--The Nipples--The Sympathy of the Breasts with the Primary Sexual Centres--This Connection Operative both through the Nerves and through the Blood--The Influence of Lactation on the Sexual Centres--Suckling and Sexual Emotion--The Significance of the Association between Suckling and Sexual Emotion--This Association as a Cause of Sexual Perversity.

We have seen that the skin generally has a high degree of sensibility, which frequently tends to be in more or less definite association with the sexual centres. We have seen also that the central and specific sexual sensation, the sexual embrace itself, is, in large measure, a specialized kind of skin reflex. Between the generalized skin sensations and the great primary sexual centre of sensation there are certain secondary sexual centres which, on account of their importance, may here be briefly considered.

These secondary centres have in common the fact that they always involve the entrances and the exits of the body--the regions, that is, where skin merges into mucous membrane, and where, in the course of evolution, tactile sensibility has become highly refined. It may, indeed, be said

generally of these frontier regions of the body that their contact with the same or a similar frontier region in another person of opposite sex, under conditions otherwise favorable to tumescence, will tend to produce a minimum and even sometimes a maximum degree of sexual excitation. Contact of these regions with each other or with the sexual region itself so closely simulates the central sexual reflex that channels are set up for the same nervous energy and secondary sexual centres are constituted.

It is important to remember that the phenomena we are here concerned with are essentially normal. Many of them are commonly spoken of as perversions. In so far, however, as they are aids to tumescence they must be regarded as coming within the range of normal variation. They may be considered unæsthetic, but that is another matter. It has, moreover, to be remembered that æsthetic values are changed under the influence of sexual emotion; from the lover's point of view many things are beautiful which are unbeautiful from the point of view of him who is not a lover, and the greater the degree to which the lover is swayed by his passion the greater the extent to which his normal æsthetic standard is liable to be modified. A broad consideration of the phenomena among civilized and uncivilized peoples amply suffices to show the fallacy of the tendency, so common among unscientific writers on these subjects, to introduce normal æsthetic standards into the sexual sphere. From the normal standpoint of ordinary daily life, indeed, the whole process of sex is unæsthetic, except the earlier stages of tumescence.[17]

So long as they constitute a part of the phase of tumescence, the utilization of the sexual excitations obtainable through these channels must be considered within the normal range of variation, as we may observe, indeed, among many animals. When, however, such contacts of the orifices of the body, other than those of the male and female sexual organs proper, are used to procure not merely tumescence, but detumescence, they become, in the strict and technical sense, perversions. They are perversions in exactly the same sense as are the methods of intercourse which involve the use of checks to prevent fecundation. The æsthetic question, however, remains the same as if we were dealing with tumescence. It is necessary that this should be pointed out clearly, even at the risk of misapprehension, as confusions are here very common.

The essentially sexual character of the sensitivity of the orificial contacts is shown by the fact that it may sometimes be accidentally developed even in early childhood. This is well illustrated in a case recorded by Féré. A little girl of 4, of

nervous temperament and liable to fits of anger in which she would roll on the ground and tear her clothes, once ran out into the garden in such a fit of temper and threw herself on the lawn in a half-naked condition. As she lay there two dogs with whom she was accustomed to play came up and began to lick the uncovered parts of the body. It so happened that as one dog licked her mouth the other licked her sexual parts. She experienced a shock of intense sensation which she could never forget and never describe, accompanied by a delicious tension of the sexual organs. She rose and ran away with a feeling of shame, though she could not comprehend what had happened. The impression thus made was so profound that it persisted throughout life and served as the point of departure of sexual perversions, while the contact of a dog's tongue with her mouth alone afterward sufficed to evoke sexual pleasure. (Féré, Archives de Neurologie, 1903, No. 90.)

I do not purpose to discuss here either cunnilingus (the apposition of the mouth to the female pudendum) or fellatio (the apposition of the mouth to the male organ), the agent in the former case being, in normal heterosexual relationships, a man, in the latter a woman; they are not purely tactile phenomena, but involve various other physical and psychic elements. Cunnilingus was a very familiar manifestation in classic times, as shown by frequent and mostly very contemptuous references in Aristophanes, Juvenal, and many other Greek and Roman writers; the Greeks regarded it as a Phoenician practice, just as it is now commonly considered French; it tends to be especially prevalent at all periods of high civilization. Fellatio has also been equally well known, in both ancient and modern times, especially as practiced by inverted men. It may be accepted that both cunnilingus and fellatio, as practiced by either sex, are liable to occur among healthy or morbid persons, in heterosexual or homosexual relationships. They have little psychological significance, except to the extent that when practiced to the exclusion of normal sexual relationships they become perversions, and as such tend to be associated with various degenerative conditions, although such associations are not invariable.

The essentially normal character of cunnilingus and fellatio, when occurring as incidents in the process of tumescence, is

shown by the fact that they are practiced by many animals. This is the case, for instance, among dogs. Moll points out that not infrequently the bitch, while under the dog, but before intromission, will change her position to lick the dog's penis--apparently from an instinctive impulse to heighten her own and his excitement--and then return to the normal position, while cunnilingus is of constant occurrence among animals, and on account of its frequency among dogs was called by the Greeks skylax (Rosenbaum, Geschichte der Lustseuche im Altertume, fifth edition, pp. 260-278; also notes in Moll, Untersuchungen über die Libido Sexualis, Bd. I, pp. 134, 369; and Bloch, Beiträge zur Ätiologie der Psychopathia Sexualis, Teil II, pp. 216 et seq.)

The occurrence of cunnilingus as a sexual episode of tumescence among lower human races is well illustrated by a practice of the natives of the Caroline Islands (as recorded by Kubary in his ethnographic study of this people and quoted by Ploss and Bartels, Das Weib, vol. i). It is here customary for a man to place a piece of fish between the labia, while he stimulates the latter by his tongue and teeth until under stress of sexual excitement the woman urinates; this is regarded as an indication that the proper moment for intercourse has arrived. Such a practice rests on physiologically sound facts whatever may be thought of it from an æsthetic standpoint.

The contrast between the normal æsthetic standpoint in this matter and the lover's is well illustrated by the following quotations: Dr. A.B. Holder, in the course of his description of the American Indian boté, remarks, concerning fellatio: "Of all the many varieties of sexual perversion, this, it seems to me, is the most debased that could be conceived of." On the other hand, in a communication from a writer and scholar of high intellectual distinction occurs the statement: "I affirm that, of all sexual acts, fellatio is most an affair of imagination and sympathy." It must be pointed out that there is no contradiction in these two statements, and that each is justified, according as we take the point of view of the ordinary onlooker or of the impassioned lover eager to give a final proof of his or her devotion. It must be added that from a scientific point of view we are not entitled to take either side.

Of the whole of this group of phenomena, the most typical and the most widespread example is certainly the kiss. We have in the lips a highly sensitive frontier region between skin and mucous membrane, in many respects analogous to the vulvo-vaginal orifice, and reinforcible, moreover, by the active movements of the still more highly sensitive tongue. Close and prolonged contact of these regions, therefore, under conditions favorable to tumescence sets up a powerful current of nervous stimulation. After those contacts in which the sexual regions themselves take a direct part, there is certainly no such channel for directing nervous force into the sexual sphere as the kiss. This is nowhere so well recognized as in France, where a young girl's lips are religiously kept for her lover, to such an extent, indeed, that young girls sometimes come to believe that the whole physical side of love is comprehended in a kiss on the mouth; so highly intelligent a woman as Madam Adam has described the agony she felt as a girl when kissed on the lips by a man, owing to the conviction that she had thereby lost her virtue. Although the lips occupy this highly important position as a secondary sexual focus in the sphere of touch, the kiss is--unlike _cunnilingus_ and _fellatio--confined to man and, indeed, to a large extent, to civilized man. It is the outcome of a compound evolution which had its beginning outside the sphere of touch, and it would therefore be out of place to deal with the interesting question of its development in this place. It will be discussed elsewhere.[18]

There is yet another orificial frontier region which is a highly important tactile sexual focus: the nipple. The breasts raise, indeed, several interesting questions in their intimate connection with the sexual sphere and it may be worth while to consider them at this point.

The breasts have from the present point of view this special significance among the sexual centres that they primarily exist, not for the contact of the lover, but the contact of the child. This is doubtless, indeed, the fundamental fact on which all the touch contacts we are here concerned with have grown up. The sexual sensitivity of the lover's lips to orificial contacts has been developed from the sensitivity of the infant's lips to contact with his mother's nipple. It is on the ground of that evolution that we are bound to consider here the precise position of the breasts as a sexual centre.

As the great secreting organs of milk, the function of the breasts must begin immediately the child is cut off from the nutrition derived from direct contact with his mother's blood. It is therefore essential that the

connection between the sexual organs proper, more especially the womb, and the breasts should be exceedingly intimate, so that the breasts may be in a condition to respond adequately to the demand of the child's sucking lips at the earliest moment after birth. As a matter of fact, this connection is very intimate, so intimate that it takes place in two totally distinct ways--by the nervous system and by the blood.

The breasts of young girls sometimes become tender at puberty in sympathy with the evolution of the sexual organs, although the swelling of the breasts at this period is not normally a glandular process. At the recurring periods of menstruation, again, sensations in the breasts are not uncommon.

It is not, however, until impregnation occurs that really decisive changes take place in the breasts. "As soon as the ovum is impregnated, that is to say within a few days," as W.D.A. Griffith states it ("The Diagnosis of Pregnancy," British Medical Journal, April 11, 1903), "the changes begin to occur in the breast, changes which are just as well worked out as are the changes in the uterus and the vagina, which, from the commencement of pregnancy, prepare for the labor which ought to follow nine months afterward. These are changes in the direction of marked activity of function. An organ which was previously quite passive, without activity of circulation and the effects of active circulation, begins to grow and continues to grow in activity and size as pregnancy progresses."

The association between breasts and womb is so obvious that it has not escaped many savage peoples, who are often, indeed, excellent observers. Among one primitive people at least the activity of the breast at impregnation seems to be clearly recognized. The Sinangolo of British New Guinea, says Seligmann (Journal of the Anthropological Institute, July-December, 1902, p. 298) believe that conception takes place in the breasts; on this account they hold that coitus should never take place before the child is weaned or he might imbibe semen with the milk.

It is natural to assume that this connection between the activity of the womb and the glandular activity of the breasts is a nervous connection, by means of the spinal cord, and such a connection certainly exists and plays a very important part in the stimulating action of the breasts on the sexual organs. But

that there is a more direct channel of communication even than the nervous system is shown by the fact that the secretion of milk will take place at parturition, even when the nervous connection has been destroyed. Mironoff found that, when the mammary gland is completely separated from the central nervous system, secretion, though slightly diminished, still continued. In two goats he cut the nerves shortly before parturition and after birth the breasts still swelled and functioned normally (*_Archives des Sciences Biologiques_*, St. Petersburg, 1895, summarized in *_L'Année Biologique_*; 1895, p. 329). Ribbert, again, cut out the mammary gland of a young rabbit and transplanted it into the ear; five months after the rabbit bore young and the gland secreted milk freely. The case has been reported of a woman whose spinal cord was destroyed by an accident at the level of the fifth and sixth dorsal vertebræ, yet lactation was perfectly normal (*_British Medical Journal_*, August 5, 1899, p. 374). We are driven to suppose that there is some chemical change in the blood, some internal secretion from the uterus or the ovaries, which acts as a direct stimulant to the breasts. (See a comprehensive discussion of the phenomena of the connection between the breasts and sexual organs, though the conclusions are not unassailable, by Temesvary, *_Journal of Obstetrics and Gynæcology of the British Empire_*, June, 1903). That this hypothetical secretion starts from the womb rather than the ovaries seems to be indicated by the fact that removal of both ovaries during pregnancy will not suffice to prevent lactation. In favor of the ovaries, see Beatson, *_Lancet_*, July, 1896; in favor of the uterus, Armand Routh, "On the Interaction between the Ovaries and the Mammary Glands," *_British Medical Journal_*, September 30, 1899.

While, however, the communications from the sexual organs to the breast are of a complex and at present ill understood character, the communication from the breasts to the sexual organs is without doubt mainly and chiefly nervous. When the child is put to the breast after birth the suction of the nipple causes a reflex contraction of the womb, and it is held by many, though not all, authorities that in a woman who does not suckle her child there is some risk that the womb will not return to its normal involuted size. It has also been asserted that to put a child to the breast during the early months of pregnancy causes so great a degree of uterine contraction that abortion may result.

Freund found in Germany that stimulation of the nipples by an electrical cupping apparatus brought about contraction of the pregnant uterus. At an earlier period it was recommended to irritate the nipple in order to excite the uterus to parturient action. Simpson, while pointing out that this was scarcely adequate to produce the effect desired, thought that placing a child to the breast after labor had begun might increase uterine action. (J.Y. Simpson, *_Obstetric Memoirs_*, vol. i, p. 836; also Féré, *_L'Instinct Sexuel_*, second edition, p. 132).

The influence of lactation over the womb in preventing the return of menstruation during its continuance is well known. According to Remfry's investigation of 900 cases in England, in 57 per cent. of cases there is no menstruation during lactation. (L. Remfry, in paper read before Obstetrical Society of London, summarized in the *_British Medical Journal_*, January 11, 1896, p. 86). Bendix, in Germany, found among 140 cases that in about 40 per cent. there was no menstruation during lactation (paper read before Düsseldorf meeting of the Society of German Naturalists and Physicians, 1899). When the child is not suckled menstruation tends to reappear about six months after parturition.

It is possible that the divergent opinions of authorities concerning the necessarily favorable influence of lactation in promoting the return of the womb to its normal size may be due to a confusion of two distinct influences: the reflex action of the nipple on the womb and the effects of prolonged glandular secretion of the breasts in debilitated persons. The act of suckling undoubtedly tends to promote uterine contraction, and in healthy women during lactation the womb may even (according to Vineberg) be temporarily reduced to a smaller size than before impregnation, thus producing what is known as "lactation atrophy." In debilitated women, however, the strain of milk-production may lead to general lack of muscular tone, and involution of the womb thus be hindered rather than aided by lactation.

On the objective side, then, the nipple is to be regarded as an erectile organ, richly supplied with nerves and vessels, which, under the stimulation of the infant's lips--or any similar compression, and even under the influence of emotion or cold,--becomes firm and projects, mainly as a result of muscular contraction; for, unlike the penis and the

clitoris, the nipple contains no true erectile tissue and little capacity for vascular engorgement.[19] We must then suppose that an impetus tends to be transmitted through the spinal cord to the sexual organs, setting up a greater or less degree of nervous and muscular excitement with uterine contraction. These being the objective manifestations, what manifestations are to be noted on the subjective side?

It is a remarkable proof of the general indifference with which in Europe even the fairly constant and prominent characteristics of the psychology of women have been treated until recent times that, so far as I am aware,--though I have made no special research to this end,--no one before the end of the eighteenth century had recorded the fact that the act of suckling tends to produce in women voluptuous sexual emotions. Cabanis in 1802, in the memoir on "Influence des Sexes" in his *_Rapports du Physique et du Moral de l'Homme_*, wrote that several suckling women had told him that the child in sucking the breast made them experience a vivid sensation of pleasure, shared in some degree by the sexual organs. There can be no doubt that in healthy suckling women this phenomenon is exceedingly common, though in the absence of any methodical and precise investigation it cannot be affirmed that it is experienced by every woman in some degree, and it is highly probable that this is not the case. One lady, perfectly normal, states that she has had stronger sexual feelings in suckling her children than she has ever experienced with her husband, but that so far as possible she has tried to repress them, as she regards them as brutish under these circumstances. Many other women state generally that suckling is the most delicious physical feeling they have ever experienced. In most cases, however, it does not appear to lead to a desire for intercourse, and some of those who make this statement have no desire for coitus during lactation, though they may have strong sexual needs at other times. It is probable that this corresponds to the normal condition, and that the voluptuous sensations aroused by suckling are adequately gratified by the child. It may be added that there are probably many women who could say, with a lady quoted by Féré,[20] that the only real pleasures of sex they have ever known are those derived from their suckling infants.

It is not difficult to see why this normal association of sexual emotion with suckling should have come about. It is essential for the preservation of the lives of young mammals that the mothers should have an adequate motive in pleasurable sensation for enduring the trouble of suckling. The most obvious method for obtaining the necessary degree of pleasurable sensation lay in utilizing the reservoir of sexual emotion, with which

channels of communication might already be said to be open through the action of the sexual organs on the breasts during pregnancy. The voluptuous element in suckling may thus be called a merciful provision of Nature for securing the maintenance of the child.

Cabanis seems to have realized the significance of this connection as the basis of the sympathy between mother and child, and more recently Lombroso and Ferrero have remarked (*_La Donna Delinquente_*, p. 438) on the fact that maternal love has a sexual basis in the element of venereal pleasure, though usually inconsiderable, experienced during suckling. Houzeau has referred to the fact that in the majority of animals the relation between mother and offspring is only close during the period of lactation, and this is certainly connected with the fact that it is only during lactation that the female animal can derive physical gratification from her offspring. When living on a farm I have ascertained that cows sometimes, though not frequently, exhibit slight signs of sexual excitement, with secretion of mucus, while being milked; so that, as the dairymaid herself observed, it is as if they were being "bulled." The sow, like some other mammals, often eats her own young after birth, mistaking them, it is thought, for the placenta, which is normally eaten by most mammals; it is said that the sow never eats her young when they have once taken the teat.

It occasionally happens that this normal tendency for suckling to produce voluptuous sexual emotions is present in an extreme degree, and may lead to sexual perversions. It does not appear that the sexual sensations aroused by suckling usually culminate in the orgasm; this however, was noted in a case recorded by Féré, of a slightly neurotic woman in whom intense sexual excitement occurred during suckling, especially if prolonged; so far as possible, she shortened the periods of suckling in order to prevent, not always successfully, the occurrence of the orgasm (Féré, *_Archives de Neurologie_* No. 30, 1903). Icard refers to the case of a woman who sought to become pregnant solely for the sake of the voluptuous sensations she derived from suckling, and Yellowlees (Art. "Masturbation," *_Dictionary of Psychological Medicine_*) speaks of the overwhelming character of "the storms of sexual feeling sometimes observed during lactation."

It may be remarked that the frequency of the association between

lactation and the sexual sensations is indicated by the fact that, as Savage remarks, lactational insanity is often accompanied by fancies regarding the reproductive organs.

When we have realized the special sensitivity of the orificial regions and the peculiarly close relationships between the breasts and the sexual organs we may easily understand the considerable part which they normally play in the art of love. As one of the chief secondary sexual characters in women, and one of her chief beauties, a woman's breasts offer themselves to the lover's lips with a less intimate attraction than her mouth only because the mouth is better able to respond. On her side, such contact is often instinctively desired. Just as the sexual disturbance of pregnancy is accompanied by a sympathetic disturbance in the breasts, so the sexual excitement produced by the lover's proximity reacts on the breasts; the nipple becomes turgid and erect in sympathy with the clitoris; the woman craves to place her lover in the place of the child, and experiences a sensation in which these two supreme objects of her desire are deliciously mingled.

The powerful effect which stimulation of the nipple produces on the sexual sphere has led to the breasts playing a prominent part in the erotic art of those lands in which this art has been most carefully cultivated. Thus in India, according to Vatsyayana, many authors are of the opinion that in approaching a woman a lover should begin by sucking the nipples of her breasts, and in the songs of the Bayaderes of Southern India sucking the nipple is mentioned as one of the natural preliminaries of coitus.

In some cases, and more especially in neurotic persons, the sexual pleasure derived from manipulation of the nipple passes normal limits and, being preferred even to coitus, becomes a perversion. In girls' schools, it is said, especially in France, sucking and titillation of the breasts are not uncommon; in men, also, titillation of the nipples occasionally produces sexual sensations (Féré, *L'Instinct Sexuel*, second edition, p. 132). Hildebrandt recorded the case of a young woman whose nipples had been sucked by her lover; by constantly drawing her breasts she became able to suck them herself and thus attained extreme sexual pleasure. A.J. Bloch, of New Orleans, has noted the case of a woman who complained of swelling of the breasts; the gentlest manipulation produced an orgasm, and it was found that the swelling had been intentionally produced for the sake of this

manipulation. Moraglia in Italy knew a very beautiful woman who was perfectly cold in normal sexual relationships, but madly excited when her husband pressed or sucked her breasts. Lombroso (*_Archivio di Psichiatria_*, 1885, fasc. IV) has described the somewhat similar case of a woman who had no sexual sensitivity in the clitoris, vagina, or labia, and no pleasure in coitus except in very strange positions, but possessed intense sexual feelings in the right nipple as well as in the upper third of the thigh.

It is remarkable that not only is suckling apt to be accompanied by sexual pleasure in the mother, but that, in some cases, the infant also appears to have a somewhat similar experience. This is, at all events, indicated in a remarkable case recorded by Féré (*_L'Instinct Sexuel_*, second edition, p. 257). A female infant child of slightly neurotic heredity was weaned at the age of 14 months, but so great was her affection for her mother's breasts, though she had already become accustomed to other food, that this was only accomplished with great difficulty and by allowing her still to caress the naked breasts several times a day. This went on for many months, when the mother, becoming again pregnant, insisted on putting an end to it. So jealous was the child, however, that it was necessary to conceal from her the fact that her younger sister was suckled at her mother's breasts, and once at the age of 3, when she saw her father aiding her mother to undress, she became violently jealous of him. This jealousy, as well as the passion for her mother's breasts, persisted to the age of puberty, though she learned to conceal it. At the age of 13, when menstruation began, she noticed in dancing with her favorite girl friends that when her breasts came in contact with theirs she experienced a very agreeable sensation, with erection of the nipples; but it was not till the age of 16 that she observed that the sexual region took part in this excitement and became moist. From this period she had erotic dreams about young girls. She never experienced any attraction for young men, but eventually married; though having much esteem and affection for her husband, she never felt any but the slightest sexual enjoyment in his arms, and then only by evoking feminine images. This case, in which the sensations of an infant at the breast formed the point of departure of a sexual perversion which lasted through life, is, so far as I am aware, unique.

FOOTNOTES:

[17] Jonas Cohn (*_Allgemeine Ästhetik_*, 1901, p. 11) lays it down that psychology has nothing to do with good or bad taste. "The distinction between good and bad taste has no meaning for psychology. On this account, the fundamental conceptions of æsthetics cannot arise from psychology." It may be a question whether this view can be accepted quite absolutely.

IV.

The Bath--Antagonism of Primitive Christianity to the Cult of the Skin--Its Cult of Personal Filth--The Reasons which Justified this Attitude--The World-wide Tendency to Association between Extreme Cleanliness and Sexual Licentiousness--The Immorality Associated with Public Baths in Europe down to Modern Times.

The hygiene of the skin, as well as its special cult, consists in bathing. The bath, as is well known, attained under the Romans a degree of development which, in Europe at all events, it has never reached before or since, and the modern visitor to Rome carries away with him no more impressive memory than that of the Baths of Caracalla. Since the coming of Christianity the cult of the skin, and even its hygiene, have never again attained the same general and unquestioned exaltation. The Church killed the bath. St. Jerome tells us with approval that when the holy Paula noted that any of her nuns were too careful in this matter she would gravely reprove them, saying that "the purity of the body and its garments means the impurity of the soul." [21] Or, as the modern monk of Mount Athos still declares: "A man should live in dirt as in a coat of mail, so that his soul may sojourn more securely within."

Our knowledge of the bathing arrangements of Roman days is chiefly derived from Pompeii. Three public baths (two for both men and women, who were also probably allowed to use the third occasionally) have so far been excavated in this small town, as well as at least three private bathing establishments (at least one of them for women), while about a dozen houses contain complete baths for private use. Even in a little farm house at Boscoreale (two miles out of Pompeii) there was an elaborate series of bathing rooms. It may be added that Pompeii was well supplied with water. All houses but the poorest had flowing jets, and some houses had as many as ten jets. (See Man's *Pompeii*, Chapters XXVI-XXVIII.)

The Church succeeded to the domination of imperial Rome, and adopted many of the methods of its predecessor. But there could be no greater contrast than is presented by the attitude of Paganism and of Christianity toward the bath.

As regards the tendencies of the public baths in imperial Rome, some of the evidence is brought together in the section on this subject in Rosenbaum's *Geschichte der Lustseuche im Alterthume*. As regards the attitude of the earliest Christian ascetics in this matter I may refer the reader to an interesting passage in Lecky's *History of European Morals* (vol. ii, pp. 107-112), in which are brought together a number of highly instructive examples of the manner in which many of the most eminent of the early saints deliberately cultivated personal filth.

In the middle ages, when the extreme excesses of the early ascetics had died out, and monasticism became regulated, monks generally took two baths a year when in health; in illness they could be taken as often as necessary. The rules of Cluny only allowed three towels to the community: one for the novices, one for the professed, and one for the lay brothers. At the end of the seventeenth century Madame de Mazarin, having retired to a convent of Visitandines, one day desired to wash her feet, but the whole establishment was set in an uproar at such an idea, and she received a direct refusal. In 1760 the Dominican Richard wrote that in itself the bath is permissible, but it must be taken solely for necessity, not for pleasure. The Church taught, and this lesson is still inculcated in convent schools, that it is wrong to expose the body even to one's own gaze, and it is not

surprising that many holy persons boasted that they had never even washed their hands. (Most of these facts have been taken from A. Franklin, *Les Soins de Toilette*, one of the *Vie Privée d'Autrefois* series, in which further details may be found.)

In sixteenth-century Italy, a land of supreme elegance and fashion, superior even to France, the conditions were the same, and how little water found favor even with aristocratic ladies we may gather from the contemporary books on the toilet, which abound with recipes against itch and similar diseases. It should be added that Burckhardt (*Die Cultur der Renaissance in Italien*, eighth edition, volume ii, p. 92) considers that in spite of skin diseases the Italians of the Renaissance were the first nation in Europe for cleanliness.

It is unnecessary to consider the state of things in other European countries. The aristocratic conditions of former days are the plebeian conditions of to-day. So far as England is concerned, such documents as Chadwick's *Report on the Sanitary Condition of the Laboring Population of Great Britain* (1842) sufficiently illustrate the ideas and the practices as regards personal cleanliness which prevailed among the masses during the nineteenth century and which to a large extent still prevail.

A considerable amount of opprobrium has been cast upon the Catholic Church for its direct and indirect influence in promoting bodily uncleanness. Nietzsche sarcastically refers to the facts, and Mr. Frederick Harrison asserts that "the tone of the middle ages in the matter of dirt was a form of mental disease." It would be easy to quote many other authors to the same effect.

It is necessary to point out, however, that the writers who have committed themselves to such utterances have not only done an injustice to Christianity, but have shown a lack of historical insight. Christianity was essentially and fundamentally a rebellion against the classic world, against its vices, and against their concomitant virtues, against both its practices and its ideals. It sprang up in a different part of the Mediterranean basin, from a different level of culture; it found its supporters in a new and lower social stratum. The cult of charity, simplicity, and faith, while not primarily ascetic, became inevitably allied with asceticism, because from its point of view: sexuality was the very stronghold of the classic world. In the second century the genius of

Clement of Alexandria and of the great Christian thinkers who followed him seized on all those elements in classic life and philosophy which could be amalgamated with Christianity without, as they trusted, destroying its essence, but in the matter of sexuality there could be no compromise, and the condemnation of sexuality involved the condemnation of the bath. It required very little insight and sagacity for the Christians to see--though we are now apt to slur over the fact--that the cult of the bath was in very truth the cult of the flesh.[22] However profound their ignorance of anatomy, physiology, and psychology might be, they had before them ample evidence to show that the skin is an outlying sexual zone and that every application which promoted the purity, brilliance, and healthfulness of the skin constituted a direct appeal, feeble or strong as the case might be, to those passions against which they were warring. The moral was evident: better let the temporary garment of your flesh be soaked with dirt than risk staining the radiant purity of your immortal soul. If Christianity had not drawn that moral with clear insight and relentless logic Christianity would never have been a great force in the world.

If any doubt is felt as to the really essential character of the connection between cleanliness and the sexual impulse it may be dispelled by the consideration that the association is by no means confined to Christian Europe. If we go outside Europe and even Christendom altogether, to the other side of the world, we find it still well marked. The wantonness of the luxurious people of Tahiti when first discovered by European voyagers is notorious. The Areoi of Tahiti, a society largely constituted on a basis of debauchery, is a unique institution so far as primitive peoples are concerned. Cook, after giving one of the earliest descriptions of this society and its objects at Tahiti (Hawkesworth, *An Account of Voyages*, etc., 1775, vol. ii, p. 55), immediately goes on to describe the extreme and scrupulous cleanliness of the people of Tahiti in every respect; they not only bathed their bodies and clothes every day, but in all respects they carried cleanliness to a higher point than even "the politest assembly in Europe." Another traveler bears similar testimony: "The inhabitants of the Society Isles are, among all the nations of the South Seas, the most cleanly; and the better sort of them carry cleanliness to a very great length"; they bathe morning and evening in the sea, he remarks, and afterward in fresh water to remove the particles of salt, wash their hands before and after meals, etc. (J.R. Forster, "*Observations made*

during a Voyage round the World_," 1798, p. 398.) And William Ellis, in his detailed description of the people of Tahiti (_Polynesian Researches_, 1832, vol. i, especially Chapters VI and IX), while emphasizing their extreme cleanliness, every person of every class bathing at least once or twice a day, dwells on what he considers their unspeakable moral debasement; "notwithstanding the apparent mildness of their disposition and the cheerful vivacity of their conversation, no portion of the human race was ever perhaps sunk lower in brutal licentiousness and moral degradation."

After leaving Tahiti Cook went on to New Zealand. Here he found that the people were more virtuous than at Tahiti, and also, he found, less clean.

It is, however, a mistake to suppose that physical uncleanness ruled supreme through mediæval and later times. It is true that the eighteenth century, which saw the birth of so much that marks our modern world, witnessed a revival of the old ideal of bodily purity. But the struggle between two opposing ideals had been carried on for a thousand years or more before this. The Church, indeed, was in this matter founded on an impregnable rock. But there never has been a time when influences outside the Church have not found a shelter somewhere. Those traditions of the classic world which Christianity threw aside as useless or worse quietly reappeared. In no respect was this more notably the case than in regard to the love of pure water and the cult of the bath. Islam adopted the complete Roman bath, and made it an institution of daily life, a necessity for all classes. Granada is the spot in Europe where to-day we find the most exquisite remains of Mohammedan culture, and, though the fury of Christian conquest dragged the harrow over the soil of Granada, even yet streams and fountains spring up there and gush abundantly and one seldom loses the sound of the splash of water. The flower of Christian chivalry and Christian intelligence went to Palestine to wrest the Holy Sepulchre from the hands of pagan Mohammedans. They found there many excellent things which they had not gone out to seek, and the Crusaders produced a kind of premature and abortive Renaissance, the shadow of lost classic things reflected on Christian Europe from the mirror of Islam.

Yet it is worth while to point out, as bearing on the associations of the bath here emphasized, that even in Islam we may trace the existence of a religious attitude unfavorable to the bath. Before the time of Mohammed there were no public baths

in Arabia, and it was and is believed that baths are specially haunted by the djinn--the evil spirits. Mohammed himself was at first so prejudiced against public baths that he forbade both men and women to enter them. Afterward, however, he permitted men to use them provided they wore a cloth round the loins, and women also when they could not conveniently bathe at home. Among the Prophet's sayings is found the assertion: "Whatever woman enters a bath the devil is with her," and "All the earth is given to me as a place of prayer, and as pure, except the burial ground and the bath." (See, e.g., E.W. Lane, Arabian Society in the Middle Ages, 1883, pp. 179-183.) Although, therefore, the bath, or hammam, on grounds of ritual ablution, hygiene, and enjoyment speedily became universally popular in Islam among all classes and both sexes, Mohammed himself may be said to have opposed it.

Among the discoveries which the Crusaders made and brought home with them one of the most notable was that of the bath, which in its more elaborate forms seems to have been absolutely forgotten in Europe, though Roman baths might everywhere have been found underground. All authorities seem to be agreed in finding here the origin of the revival of the public bath. It is to Rome first, and later to Islam, the lineal inheritor of classic culture, that we owe the cult of water and of physical purity. Even to-day the Turkish bath, which is the most popular of elaborate methods of bathing, recalls by its characteristics and its name the fact that it is a Mohammedan survival of Roman life.

From the twelfth century onward baths have repeatedly been introduced from the East, and reintroduced afresh in slightly modified forms, and have flourished with varying degrees of success. In the thirteenth century they were very common, especially in Paris, and though they were often used, more especially in Germany, by both sexes in common, every effort was made to keep them orderly and respectable. These efforts were, however, always unsuccessful in the end. A bath always tended in the end to become a brothel, and hence either became unfashionable or was suppressed by the authorities. It is sufficient to refer to the reputation in England of "hot-houses" and "bagnios." It was not until toward the end of the eighteenth century that it began to be recognized that the claims of physical cleanliness were sufficiently imperative to make it necessary that the fairly avoidable risks to morality in bathing should be avoided and the unavoidable risks bravely incurred. At the present day, now that we are accustomed to weave ingeniously together in the texture of our lives the conflicting traditions of classic and Christian days, we have

almost persuaded ourselves that the pagan virtue of cleanliness comes next after godliness, and we bathe, forgetful of the great moral struggle which once went on around the bath. But we refrain from building ourselves palaces to bathe in, and for the most part we bathe with exceeding moderation.[23] It is probable that we may best harmonize our conflicting traditions by rejecting not only the Christian glorification of dirt, but also, save for definitely therapeutic purposes, the excessive heat, friction, and stimulation involved by the classic forms of bathing. Our reasonable ideal should render it easy and natural for every man, woman, and child to have a simple bath, tepid in winter, cold in summer, all the year round.

For the history of the bath in mediæval times and later Europe, see A. Franklin, *_Les Soins de Toilette_*, in the *_Vie Privée d'Autrefois_* series; Rudeck, *_Geschichte der öffentlichen Sittlichkeit in Deutschland_*; T. Wright, *_The Homes of Other Days_*; E. Dühren, *_Das Geschlechtsleben in England_*, bd. 1.

Outside the Church, there was a greater amount of cleanliness than we are sometimes apt to suppose. It may, indeed, be said that the uncleanness of holy men and women would have attracted no attention if it had corresponded to the condition generally prevailing. Before public baths were established bathing in private was certainly practiced; thus Ordericus Vitalis, in narrating the murder of Mabel, the Countess de Montgomery, in Normandy in 1082, casually mentions that she was lying on the bed after her bath (*_Ecclesiastical History_*, Book V, Chapter XIII). In warm weather, it would appear, mediæval ladies bathed in streams, as we may still see countrywomen do in Russia, Bohemia, and occasionally nearer home. The statement of the historian Michelet, therefore, that Percival, Iseult, and the other ethereal personages of mediæval times "certainly never washed" (*_La Sorcière_*, p. 110) requires some qualification.

In 1292 there were twenty-six bathing establishments in Paris, and an attendant would go through the streets in the morning announcing that they were ready. One could have a vapor bath only or a hot bath to succeed it, as in the East. No woman of bad reputation, leper, or vagabond was at this time allowed to frequent the baths, which were closed on Sundays and feast-days. By the fourteenth century, however, the baths began to have a reputation for immorality, as well as luxury, and, according to

Dufour, the baths of Paris "rivalled those of imperial Rome: love, prostitution, and debauchery attracted the majority to the bathing establishments, where everything was covered by a decent veil." He adds that, notwithstanding the scandal thus caused and the invectives of preachers, all went to the baths, young and old, rich and poor, and he makes the statement, which seems to echo the constant assertion of the early Fathers, that "a woman who frequented the baths returned home physically pure only at the expense of her moral purity."

In Germany there was even greater freedom of manners in bathing, though, it would seem, less real licentiousness. Even the smallest towns had their baths, which were frequented by all classes. As soon as the horn blew to announce that the baths were ready all hastened along the street, the poorer folk almost completely undressing themselves before leaving their homes. Bathing was nearly always in common without any garment being worn, women attendants commonly rubbed and massaged both sexes, and the dressing room was frequently used by men and women in common; this led to obvious evils. The Germans, as Weinhold points out (*Die Deutschen Frauen im Mittelalter*, 1882, bd. ii, pp. 112 et seq.), have been fond of bathing in the open air in streams from the days of Tacitus and Cæsar until comparatively modern times, when the police have interfered. It was the same in Switzerland. Poggio, early in the sixteenth century, found it the custom for men and women to bathe together at Baden, and said that he seemed to be assisting at the *floralia* of ancient Rome, or in Plato's Republic. Sénancour, who quotes the passage (*De l'Amour*, 1834, vol. i, p. 313), remarks that at the beginning of the nineteenth century there was still great liberty at the Baden baths.

Of the thirteenth century in England Thomas Wright (*Homes of Other Days*, 1871, p. 271) remarks: "The practice of warm bathing prevailed very generally in all classes of society, and is frequently alluded to in the mediæval romances and stories. For this purpose a large bathing-tub was used. People sometimes bathed immediately after rising in the morning, and we find the bath used after dinner and before going to bed. A bath was also often prepared for a visitor on his arrival from a journey; and, what seems still more singular, in the numerous stories of amorous intrigues the two lovers usually began their interviews

by bathing together."

In England the association between bathing and immorality was established with special rapidity and thoroughness. Baths were here officially recognized as brothels, and this as early as the twelfth century, under Henry II. These organized bath-brothels were confined to Southwark, outside the walls of the city, a quarter which was also given up to various sports and amusements. At a later period, "hot-houses," bagnios, and hummums (the eastern hammam) were spread all over London and remained closely identified with prostitution, these names, indeed, constantly tending to become synonymous with brothels. (T. Wright, Homes of Other Days, 1871, pp. 494-496, gives an account of them.)

In France the baths, being anathematized by both Catholics and Huguenots, began to lose vogue and disappear. "Morality gained," remarks Franklin, "but cleanliness lost." Even the charming and elegant Margaret of Navarre found it quite natural for a lady to mention incidentally to her lover that she had not washed her hands for a week. Then began an extreme tendency to use cosmetics, essences, perfumes, and a fierce war with vermin, up to the seventeenth century, when some progress was made, and persons who desired to be very elegant and refined were recommended to wash their faces "nearly every day." Even in 1782, however, while a linen cloth was advised for the purpose of cleaning the face and hands, the use of water was still somewhat discountenanced. The use of hot and cold baths was now, however, beginning to be established in Paris and elsewhere, and the bathing establishments at the great European health resorts were also beginning to be put on the orderly footing which is now customary. When Casanova, in the middle of the eighteenth century, went to the public baths at Berne he was evidently somewhat surprised when he found that he was invited to choose his own attendant from a number of young women, and when he realized that these attendants were, in all respects, at the disposition of the bathers. It is evident that establishments of this kind were then already dying out, although it may be added that the customs described by Casanova appear to have persisted in Budapest and St. Petersburg almost or quite up to the present. The great European public baths have long been above suspicion in this respect (though homosexual practices are not quite

excluded), while it is well recognized that many kinds of hot baths now in use produce a powerfully stimulating action upon the sexual system, and patients taking such baths for medical purposes are frequently warned against giving way to these influences.

The struggle which in former ages went on around bathing establishments has now been in part transferred to massage establishments. Massage is an equally powerful stimulant to the skin and the sexual sphere,--acting mainly by friction instead of mainly by heat,--and it has not yet attained that position of general recognition and popularity which, in the case of bathing establishments, renders it bad policy to court disrepute.

Like bathing, massage is a hygienic and therapeutic method of influencing the skin and subjacent tissues which, together with its advantages, has certain concomitant disadvantages in its liability to affect the sexual sphere. This influence is apt to be experienced by individuals of both sexes, though it is perhaps specially marked in women. Jouin (quoted in *Paris _Journal de Médecine_*, April 23, 1893) found that of 20 women treated by massage, of whom he made inquiries, 14 declared that they experienced voluptuous sensations; 8 of these belonged to respectable families; the other 6 were women of the *_demimonde_* and gave precise details; Jouin refers in this connection to the *_aliptes_* of Rome. It is unnecessary to add that the gynæcological massage introduced in recent years by the Swedish teacher of gymnastics, Thure-Brandt, as involving prolonged rubbing and kneading of the pelvic regions, "*_pression glissante du vagin_*" etc. (*_Massage Gynécologique_*, by G. de Frumerie, 1897), whatever its therapeutic value, cannot fail in a large proportion of cases to stimulate the sexual emotions. (Eulenburg remarks that for sexual anæsthesia in women the Thure-Brandt system of massage may "naturally" be recommended, *_Sexuale Neuropathie_*, p. 78.) I have been informed that in London and elsewhere massage establishments are sometimes visited by women who seek sexual gratification by massage of the genital regions by the *_masseuse_*.

FOOTNOTES:

[21] "_Dicens munditiam corporis atque vestitus animæ esse immunditiam_"--St. Jerome, _Ad Eustochium Virginem_.

[22] With regard to the physiological mechanism by which bathing produces its tonic and stimulating effects Woods Hutchinson has an interesting discussion (Chapter VII) in his _Studies in Human and Comparative Pathology_.

[23] Thus among the young women admitted to the Chicago Normal School to be trained as teachers, Miss Lura Sanborn, the director of physical training, states (_Doctor's Magazine_, December, 1900) that a bath once a fortnight is found to be not unusual.

V.

Summary--Fundamental Importance of Touch--The Skin the Mother of All the Other Senses.

The sense of touch is so universally diffused over the whole skin, and in so many various degrees and modifications, and it is, moreover, so truly the Alpha and the Omega of affection, that a broken and fragmentary treatment of the subject has been inevitable.

The skin is the archæological field of human and prehuman experience, the foundation on which all forms of sensory perception have grown up, and as sexual sensibility is among the most ancient of all forms of sensibility, the sexual instinct is necessarily, in the main, a comparatively slightly modified form of general touch sensibility. This primitive character of the great region of tactile sensation, its vagueness and diffusion, the comparatively unintellectual as well as unæsthetic nature of the mental conceptions which arise on the tactile basis make it difficult to deal precisely with the psychology of touch. The very same qualities, however, serve greatly to heighten the emotional intensity of skin sensations. So that, of all the great sensory fields, the field of touch is at once the least intellectual and the most massively emotional. These qualities, as well as its intimate and primitive association with the apparatus of tumescence and detumescence, make touch the readiest and most powerful channel by which the sexual sphere may be reached.

In disentangling the phenomena of tactile sensibility ticklishness has been selected for special consideration as a kind of sensation, founded on reflexes developing even before birth, which is very closely related to sexual phenomena. It is, as it were, a play of tumescence, on which laughter supervenes as a play of detumescence. It leads on to the more serious phenomena of tumescence, and it tends to die out after adolescence, at the period during which sexual relationships normally begin. Such a view of ticklishness, as a kind of modesty of the skin, existing merely to be destroyed, need only be regarded as one of its aspects. Ticklishness certainly arose from a non-sexual starting-point, and may well have protective uses in the young animal.

The readiness with which tactile sensibility takes on a sexual character and forms reflex channels of communication with the sexual sphere proper is illustrated by the existence of certain secondary sexual foci only inferior in sexual excitability to the genital region. We have seen that the chief of these normal foci are situated in the orificial regions where skin and mucous membrane meet, and that the contact of any two orificial regions between two persons of different sex brought together under favorable conditions is apt, when prolonged, to produce a very intense degree of sexual erethism. This is a normal phenomenon in so far as it is a part of tumescence, and not a method of obtaining detumescence. The kiss is a typical example of these contacts, while the nipple is of special interest in this connection, because we are thereby enabled to bring the psychology of lactation into intimate relationship with the psychology of sexual love.

The extreme sensitiveness of the skin, the readiness with which its stimulation reverberates into the sexual sphere, clearly brought out by the present study, enable us to understand better a very ancient contest--the moral struggle around the bath. There has always been a tendency for the extreme cultivation of physical purity to lead on to the excessive stimulation of the sexual sphere; so that the Christian ascetics were entirely justified, on their premises, in fighting against the bath and in directly or indirectly fostering a cult of physical uncleanness. While, however, in the past there has clearly been a general tendency for the cult of physical purity to be associated with moral licentiousness, and there are sufficient grounds for such an association, it is important to remember that it is not an inevitable and fatal association; a scrupulously clean person is by no means necessarily impelled to licentiousness; a physically unclean person is by no means necessarily

morally pure. When we have eliminated certain forms of the bath which must be regarded as luxuries rather than hygienic necessities, though they occasionally possess therapeutic virtues, we have eliminated the most violent appeals of the bath to the sexual impulse. So imperative are the demands of physical purity now becoming, in general opinion, that such small risks to moral purity as may still remain are constantly and wisely disregarded, and the immoral traditions of the bath now, for the most part, belong to the past.

SMELL.

I.

The Primitiveness of Smell--The Anatomical Seat of the Olfactory Centres--Predominance of Smell among the Lower Mammals--Its Diminished Importance in Man--The Attention Paid to Odors by Savages.

The first more highly organized sense to arise on the diffused tactile sensitivity of the skin is, in most cases, without doubt that of smell. At first, indeed, olfactory sensibility is not clearly differentiated from general tactile sensibility; the pit of thickened and ciliated epithelium or the highly mobile antennæ which in many lower animals are sensitive to odorous stimuli are also extremely sensitive to tactile stimuli; this is, for instance, the case with the snail, in whom at the same time olfactive sensibility seems to be spread over the whole body.[24] The sense of smell is gradually specialized, and when taste also begins to develop a kind of chemical sense is constituted. The organ of smell, however, speedily begins to rise in importance as we ascend the zoölogical scale. In the lower vertebrates, when they began to adopt a life on dry land, the sense of smell seems to have been that part of their sensory equipment which proved most useful under the new conditions, and it developed with astonishing rapidity. Edinger finds that in the brain of reptiles the "area olfactoria" is of enormous extent, covering, indeed, the greater part of the cortex, though it may be quite true, as Herrick remarks, that, while smell is preponderant, it is perhaps not correct to attribute an exclusively olfactory tone to the cerebral activities of the Sauropsida or even the Ichthyopsida. Among most mammals, however, in any case, smell is certainly the most highly developed of the senses; it gives the

first information of remote objects that concern them; it gives the most precise information concerning the near objects that concern them; it is the sense in terms of which most of their mental operations must be conducted and their emotional impulses reach consciousness. Among the apes it has greatly lost importance and in man it has become almost rudimentary, giving place to the supremacy of vision.

Prof. G. Elliot Smith, a leading authority on the brain, has well summarized the facts concerning the predominance of the olfactory region in the mammal brain, and his conclusions may be quoted. It should be premised that Elliot Smith divides the brain into rhinencephalon and neopallium. Rhinencephalon designates the regions which are pre-eminently olfactory in function: the olfactory bulb, its peduncle, the tuberculum olfactorium and locus perforatus, the pyriform lobe, the paraterminal body, and the whole hippocampal formation. The neopallium is the dorsal cap of the brain, with frontal, parietal, and occipital areas, comprehending all that part of the brain which is the seat of the higher associative activities, reaching its fullest development in man.

"In the early mammals the olfactory areas form by far the greater part of the cerebral hemisphere, which is not surprising when it is recalled that the forebrain is, in the primitive brain, essentially an appendage, so to speak, of the smell apparatus. When the cerebral hemisphere comes to occupy such a dominant position in the brain it is perhaps not unnatural to find that the sense of smell is the most influential and the chief source of information to the animal; or, perhaps, it would be more accurate to say that the olfactory sense, which conveys general information to the animal such as no other sense can bring concerning its prey (whether near or far, hidden or exposed), is much the most serviceable of all the avenues of information to the lowly mammal leading a terrestrial life, and therefore becomes predominant; and its particular domain--the forebrain--becomes the ruling portion of the nervous system.

"This early predominance of the sense of smell persists in most mammals (unless an aquatic mode of life interferes and deposes it: compare the Cetacea, Sirenia, and Pinnipedia, for example) even though a large neopallium develops to receive visual, auditory, tactile, and other impressions pouring into the

forebrain. In the _Anthropoidea_ alone of nonaquatic mammals the olfactory regions undergo an absolute (and not only relative, as in the _Carnivora_ and _Ungulata_) dwindling, which is equally shared by the human brain, in common with those of the other _Simiidae_, the _Cercopithecidae_, and the _Cebidae_. But all the parts of the rhinencephalon, which are so distinct in macrosmatic mammals, can also be recognized in the human brain. The small ellipsoidal olfactory bulb is moored, so to speak, on the cribriform plate of the ethmoid bone by the olfactory nerves; so that, as the place of attachment of the olfactory peduncle to the expanding cerebral hemisphere becomes removed (as a result of the forward extension of the hemisphere) progressively farther and farther backward, the peduncle becomes greatly stretched and elongated. And, as this stretching involves the gray matter without lessening the number of nerve-fibres in the olfactory tract, the peduncle becomes practically what it is usually called--i.e., the olfactory 'tract.' The tuberculum olfactorium becomes greatly reduced and at the same time flattened; so that it is not easy to draw a line of demarcation between it and the anterior perforated space. The anterior rhinal fissure, which is present in the early human foetus, vanishes (almost, if not altogether) in the adult. Part of the posterior rhinal fissure is always present in the 'incisura temporalis,' and sometimes, especially in some of the non-European races, the whole of the posterior rhinal fissure is retained in that typical form which we find in the anthropoid apes." (G. Elliot Smith, in _Descriptive and Illustrated Catalogue of the Physiological Series of Comparative Anatomy Contained in the Museum of the Royal College of Surgeons of England_, second edition, vol. ii.) A full statement of Elliot Smith's investigations, with diagrams, is given by Bullen, _Journal of Mental Science_, July, 1899. It may be added that the whole subject of the olfactory centres has been thoroughly studied by Elliot Smith, as well as by Edinger, Mayer, and C.L. Herrick. In the _Journal of Comparative Neurology_, edited by the last named, numerous discussions and summaries bearing on the subject will be found from 1896 onward. Regarding the primitive sense-organs of smell in the various invertebrate groups some information will be found in A.B. Griffiths's _Physiology of the Invertebrata_, Chapter XI.

The predominance of the olfactory area in the nervous system of the vertebrates generally has inevitably involved intimate psychic

associations between olfactory stimuli and the sexual impulse. For most mammals not only are all sexual associations mainly olfactory, but the impressions received by this sense suffice to dominate all others. An animal not only receives adequate sexual excitement from olfactory stimuli, but those stimuli often suffice to counterbalance all the evidence of the other senses.

We may observe this very well in the case of the dog. Thus, a young dog, well known to me, who had never had connection with a bitch, but was always in the society of its father, once met the latter directly after the elder dog had been with a bitch. He immediately endeavored to behave toward the elder dog, in spite of angry repulses, exactly as a dog behaves toward a bitch in heat. The messages received by the sense of smell were sufficiently urgent not only to set the sexual mechanism in action, but to overcome the experiences of a lifetime. There is an interesting chapter on the sense of smell in the mental life of the dog in Giessler's *Psychologie des Geruches*, 1894, Chapter XI, Passy (in the appendix to his memoir on olfaction, *L'Année Psychologique*, 1895) gives the result of some interesting experiments as to the effects of perfume on dogs; civet and castoreum were found to have the most powerfully exciting effect.

The influences of smell are equally omnipotent in the sexual life of many insects. Thus, Féré has found that in cockchafers sexual coupling failed to take place when the antennæ, which are the organs of smell, were removed; he also found that males, after they had coupled with females, proved sexually attractive to other males (*Comptes Rendus de la Société de Biologie*, May 21, 1898). Féré similarly found that, in a species of *Bombyx*, males after contact with females sometimes proved attractive to other males, although no abnormal relationships followed. (*Soc. de Biol.*, July 30, 1898.)

With the advent of the higher apes, and especially of man, all this has been changed. The sense of smell, indeed, still persists universally and it is still also exceedingly delicate, though often neglected.[25] It is, moreover, a useful auxiliary in the exploration of the external world, for, in contrast to the very few sensations furnished to us by touch and by taste, we are acquainted with a vast number of smells, though the information they give us is frequently vague. An experienced perfumer,

says Piesse, will have two hundred odors in his laboratory and can distinguish them all. To a sensitive nose nearly everything smells. Passy goes so far as to state that he has "never met with any object that is really inodorous when one pays attention to it, not even excepting glass," and, though we can scarcely accept this statement absolutely,--especially in view of the careful experiments of Ayrton, which show that, contrary to a common belief, metals when perfectly clean and free from traces of contact with the skin or with salt solutions have no smell,--odor is still extremely widely diffused. This is especially the case in hot countries, and the experiments of the Cambridge Anthropological Expedition on the sense of smell of the Papuans were considerably impeded by the fact that at Torres Straits everything, even water, seemed to have a smell. Savages are often accused more or less justly of indifference to bad odors. They are very often, however, keenly alive to the significance of smells and their varieties, though it does not appear that the sense of smell is notably more developed in savage than in civilized peoples. Odors also continue to play a part in the emotional life of man, more especially in hot countries. Nevertheless both in practical life and in emotional life, in science and in art, smell is, at the best, under normal conditions, merely an auxiliary. If the sense of smell were abolished altogether the life of mankind would continue as before, with little or no sensible modification, though the pleasures of life, and especially of eating and drinking, would be to some extent diminished.

In New Ireland, Duffield remarks (Journal of the Anthropological Institute, 1886, p. 118), the natives have a very keen sense of smell; unusual odors are repulsive to them, and "carbolic acid drove them wild."

The New Caledonians, according to Foley (Bulletin de la Société d'Anthropologie, November 6, 1879), only like the smells of meat and fish which are becoming "high," like popoya, which smells of fowl manure, and kava, of rotten eggs. Fruits and vegetables which are beginning to go bad seem the best to them, while the fresh and natural odors which we prefer seem merely to say to them: "We are not yet eatable." (A taste for putrefying food, common among savages, by no means necessarily involves a distaste for agreeable scents, and even among Europeans there is a widespread taste for offensively smelling and putrid foods, especially cheese and game.)

The natives of Torres Straits were carefully examined by Dr. C.S.

Myers with regard to their olfactory acuteness and olfactory preferences. It was found that acuteness was, if anything, slightly greater than among Europeans. This appeared to be largely due to the careful attention they pay to odors. The resemblances which they detected among different odorous substances were frequently found to rest on real chemical affinities. The odors they were observed to dislike most frequently were asafoetida, valerianic acid, and civet, the last being regarded as most repulsive of all on account of its resemblance to faecal odor, which these people regard with intense disgust. Their favorite odors were musk, thyme, and especially violet. (_Report of the Cambridge Anthropological Expedition to Torres Straits_, vol. ii, Part II, 1903.)

In Australia Lumholtz (_Among Cannibals_, p. 115) found that the blacks had a keener sense of smell than he possessed.

In New Zealand the Maoris, as W. Colenso shows, possessed, formerly at all events, a very keen sense of smell or else were very attentive to smell, and their taste as regarded agreeable and disagreeable odors corresponded very closely to European taste, although it must be added that some of their common articles of food possessed a very offensive odor. They are not only sensitive to European perfumes, but possessed various perfumes of their own, derived from plants and possessing a pleasant, powerful, and lasting odor; the choicest and rarest was the gum of the _taramea_ (_Aciphylla Colensoi_), which was gathered by virgins after the use of prayers and charms. Sir Joseph Banks noted that Maori chiefs wore little bundles of perfumes around their necks, and Cook made the same observation concerning the young women. References to the four chief Maori perfumes are contained in a stanza which is still often hummed to express satisfaction, and sung by a mother to her child:--

"My little neck-satchel of sweet-scented moss,
My little neck-satchel of fragrant fern,
My little neck-satchel of odoriferous gum,
My sweet-smelling neck-locket of sharp-pointed _taramea_."

In the summer season the sleeping houses of Maori chiefs were often strewn with a large, sweet-scented, flowering grass of powerful odor. (W. Colenso, _Transactions of the New Zealand

Institute_, vol. xxiv, reprinted in *Nature*, November 10, 1892.)

Javanese women rub themselves with a mixture of chalk and strong essence which, when rubbed off, leaves a distinct perfume on the body. (Stratz, *Die Frauenkleidung*, p. 84.)

The Samoans, Friedländer states (*Zeitschrift für Ethnologie*, 1899, p. 52), are very fond of fragrant and aromatic odors. He gives a list of some twenty odorous plants which they use, more especially as garlands for the head and neck, including ylang-ylang and gardenia; he remarks that of one of these plants (cordyline) he could not himself detect the odor.

The Nicobarese, Man remarks (*Journal of the Anthropological Institute*, 1889, p. 377), like the natives of New Zealand, particularly dislike the smell of carbolic acid. Both young men and women are very partial to scents; the former say they find their use a certain passport to the favor of their wives, and they bring home from the jungle the scented leaves of a certain creeper to their sweethearts and wives.

Swahili women devote much attention to perfuming themselves. When a woman wishes to make herself desirable she anoints herself all over with fragrant ointments, sprinkles herself with rose-water, puts perfume into her clothes, strews jasmine flowers on her bed as well as binding them round her neck and waist, and smokes *ûdi*, the perfumed wood of the aloe; "every man is glad when his wife smells of *ûdi*" (Velten, *Sitten und Gebräuche der Suaheli*, pp. 212-214).

II.

Rise of the Study of Olfaction--Cloquet--Zwaardemaker--The Theory of Smell--The Classification of Odors--The Special Characteristics of Olfactory Sensation in Man--Smell as the Sense of Imagination--Odors as Nervous Stimulants--Vasomotor and Muscular Effects--Odorous Substances as Drugs.

During the eighteenth century a great impetus was given to the physiological and psychological study of the senses by the philosophical doctrines of Locke and the English school generally which then prevailed in Europe. These thinkers had emphasized the immense importance of the information derived through the senses in building up the intellect, so that the study of all the sensory channels assumed a significance which it had never possessed before. The olfactory sense fully shared in the impetus thus given to sensory investigation. At the beginning of the nineteenth century a distinguished French physician, Hippolyte Cloquet, a disciple of Cabanis, devoted himself more especially to this subject. After publishing in 1815 a preliminary work, he issued in 1821 his *_Osphrésiologie, ou Traité des odeurs, du sens et des organes de l'Olfaction_*, a complete monograph on the anatomy, physiology, psychology, and pathology of the olfactory organ and its functions, and a work that may still be consulted with profit, if indeed it can even yet be said to be at every point superseded. After Cloquet's time the study of the sense of smell seems to have fallen into some degree of discredit. For more than half a century no important progress was made in this field. Serious investigators seemed to have become shy of the primitive senses generally, and the subject of smell was mainly left to those interested in "curious" subjects. Many interesting observations were, however, incidentally made; thus Laycock, who was a pioneer in so many by-paths of psychology and anthropology, showed a special interest in the olfactory sense, and frequently touched on it in his *_Nervous Diseases of Women_* and elsewhere. The writer who more than any other has in recent years restored the study of the sense of smell from a by-path to its proper position as a highway for investigation is without doubt Professor Zwaardemaker, of Utrecht. The invention of his first olfactometer in 1888 and the appearance in 1895 of his great work *_Die Physiologie des Geruchs_* have served to give the physiology of the sense of smell an assured status and to open the way anew for much fruitful investigation, while a number of inquirers in many countries have had their attention directed to the

elucidation of this sense.

Notwithstanding, however, the amount of work which has been done in this field during recent years, it cannot be said that the body of assured conclusions so far reached is large. The most fundamental principles of olfactory physiology and psychology are still somewhat vague and uncertain. Although sensations of smell are numerous and varied, in this respect approaching the sensations of vision and hearing, smell still remains close to touch in the vagueness of its messages (while the most sensitive of the senses, remarks Passy, it is the least precise), the difficulty of classifying them, the impossibility of so controlling them as to found upon them any art. It seems better, therefore, not to attempt to force the present study of a special aspect of olfaction into any general scheme which may possibly not be really valid.

The earliest and most general tendency in regard to the theory of smell was to regard it as a kind of chemical sense directly stimulated by minute particles of solid substance. A vibratory theory of smell, however, making it somewhat analogous to hearing, easily presents itself. When I first began the study of physiology in 1881, a speculation of this kind presented itself to my mind. Long before Philipp von Walther, a professor at Landshut, had put forward a dynamic theory of olfaction (*Physiologie des Menschen*, 1807-8, vol. ii, p. 278). "It is a purely dynamic operation of the odorous substance in the olfactory organ," he stated. Odor is conveyed by the air, he believed, in the same way as heat. It must be added that his reasons for this theory will not always bear examination. More recently a similar theory has been seriously put forward in various quarters. Sir William Ramsay tentatively suggested such a theory (*Nature*, vol. xxv, p. 187) in analogy with light and sound. Haycraft (*Proceedings of the Royal Society of Edinburgh*, 1883-87, and *Brain*, 1887-88), largely starting from Mendelieff's law of periodicity, similarly sought to bring smell into line with the higher senses, arguing that molecules with the same vibration have the same smell. Rutherford (*Nature*, August 11, 1892, p. 343), attaching importance to the evidence brought forward by von Brunn showing that the olfactory cells terminate in very delicate short hairs, also stated his belief that the different qualities of smell result from differences in the frequency and form of the vibrations initiated by the action of the chemical molecules on these olfactory cells, though he

admitted that such a conception involved a very subtle conception of molecular vibration. Vaschide and Van Melle (Paris Academy of Sciences, December 26, 1899) have, again, argued that smell is produced by rays of short wave-lengths, analogous to light-rays, Röntgen rays, etc. Chemical action is however, a very important factor in the production of odors; this has been well shown by Ayrton (*Nature*, September 8, 1898). We seem to be forced in the direction of a chemico-vibratory theory, as pointed out by Southerden (*Nature*, March 26, 1903), the olfactory cells being directly stimulated, not by the ordinary vibrations of the molecules, but by the agitations accompanying chemical changes.

The vibratory hypothesis of the action of odors has had some influence on the recent physiologists who have chiefly occupied themselves with olfaction. "It is probable," Zwaardemaker writes (*L'Année Psychologique*, 1898), "that aroma is a physico-chemical attribute of the molecules"; he points out that there is an intimate analogy between color and odor, and remarks that this analogy leads us to suppose in an aroma ether vibrations of which the period is determined by the structure of the molecule.

Since the physiology of olfaction is yet so obscure it is not surprising that we have no thoroughly scientific classification of smells, notwithstanding various ambitious attempts to reach a classification. The classification adopted by Zwaardemaker is founded on the ancient scheme of Linnæus, and may here be reproduced:--

I. Ethereal odors (chiefly esters; Rimmel's fruity series).

II. Aromatic odors (terpenes, camphors, and the spicy, herbaceous, rosaceous, and almond series; the chemical types are well determined: cineol, eugenol, anethol, geraniol, benzaldehyde).

III. The balsamic odors (chiefly aldehydes, Rimmel's jasmin, violet, and balsamic series, with the chemical types: terpeneol, ionone, vanillin).

IV. The ambrosiacal odors (ambergris and musk).

V. The alliaceous odors, with the cacodylic group (asafoetida, ichthyol, etc.).

VI. Empyreumatic odors.

VII. Valerianaceous odors (Linnæus's *_Odores hircini_*, the capryl group, largely composed of sexual odors).

VIII. Narcotic odors (Linnæus's *_Odores tetri_*).

IX. Stenches.

A valuable and interesting memoir, "Revue Générale sur les Sensations Olfactives," by J. Passy, the chief French authority on this subject, will be found in the second volume of *_L'Année Psychologique_*, 1895. In the fifth issue of the same year-book (for 1898) Zwaardemaker presents a full summary of his work and views, "Les Sensations Olfactives, leurs Combinaisons et leurs Compensations." A convenient, but less authoritative, summary of the facts of normal and pathological olfaction will be found in a little volume of the "Actualités Médicales" series by Dr. Collet, *_L'Odorat et ses Troubles_*, 1904. In a little book entitled *_Wegweiser zu einer Psychologie des Geruches_* (1894) Giessler has sought to outline a psychology of smell, but his sketch can only be regarded as tentative and provisional.

At the outset, nevertheless, it seems desirable that we should at least have some conception of the special characteristics which mark the great and varied mass of sensations reaching the brain through the channel of the olfactory organ. The main special character of olfactory images seems to be conditioned by the fact that they are intermediate in character between those of touch or taste and those of sight or sound, that they have much of the vagueness of the first and something of the richness and variety of the second. Æsthetically, also, they occupy an intermediate position between the higher and the lower senses.[26] They are, at the same time, less practically useful than either the lower or the higher senses. They furnish us with a great mass of what we may call by-sensations, which are of little practical use, but inevitably become intimately mixed with the experiences of life by association and thus acquire an emotional significance which is often very considerable. Their emotional force, it may well be, is connected with the fact that their anatomical seat is the most ancient part of the brain. They lie in a

remote almost disused storehouse of our minds and show the fascination or the repulsiveness of all vague and remote things. It is for this reason that they are--to an extent that is remarkable when we consider that they are much more precise than touch sensations--subject to the influence of emotional associations. The very same odor may be at one moment highly pleasant, at the next moment highly unpleasant, in accordance with the emotional attitude resulting from its associations. Visual images have no such extreme flexibility; they are too definite to be so easily influenced. Our feelings about the beauty of a flower cannot oscillate so easily or so far as may our feelings about the agreeableness of its odor. Our olfactory experiences thus institute a more or less continuous series of by-sensations accompanying us through life, of no great practical significance, but of considerable emotional significance from their variety, their intimacy, their associational facility, their remote ancestral reverberations through our brains.

It is the existence of these characteristics--at once so vague and so specific, so useless and so intimate--which led various writers to describe the sense of smell as, above all others, the sense of imagination. No sense has so strong a power of suggestion, the power of calling up ancient memories with a wider and deeper emotional reverberation, while at the same time no sense furnishes impressions which so easily change emotional color and tone, in harmony with the recipient's general attitude. Odors are thus specially apt both to control the emotional life and to become its slaves. With the use of incense religions have utilized the imaginative and symbolical virtues of fragrance. All the legends of the saints have insisted on the odor of sanctity that exhales from the bodies of holy persons, especially at the moment of death. Under the conditions of civilization these primitive emotional associations of odor tend to be dispersed, but, on the other hand, the imaginative side of the olfactory sense becomes accentuated, and personal idiosyncrasies of all kinds tend to manifest themselves in the sphere of smell.

Rousseau (in *_Emile_*, Bk. II) regarded smell as the sense of the imagination. So, also, at an earlier period, it was termed (according to Cloquet) by Cardano. Cloquet frequently insisted on the qualities of odors which cause them to appeal to the imagination; on their irregular and inconstant character; on their power of intoxicating the mind on some occasions; on the curious individual and racial preferences in the matter of odors. He remarked on the fact that the Persians employed asafoetida as a seasoning, while valerian was accounted a perfume in antiquity.

(Cloquet, *_Osphrésiologie_*, pp. 28, 45, 71, 112.) It may be added, as a curious example familiar to most people of the dependence of the emotional tone of a smell on its associations, that, while the exhalations of other people's bodies are ordinarily disagreeable to us, such is not the case with our own; this is expressed in the crude and vigorous dictum of the Elizabethan poet, Marston, "Every man's dung smell sweet i' his own nose." There are doubtless many implications, moral as well as psychological, in that statement.

The modern authorities on olfaction, Passy and Zwaardemaker, both alike insist on the same characteristics of the sense of smell: its extreme acuity and yet its vagueness. "We live in a world of odor," Zwaardemaker remarks (*_L'Année Psychologique_*, 1898, p. 203), "as we live in a world of light and of sound. But smell yields us no distinct ideas grouped in regular order, still less that are fixed in the memory as a grammatical discipline. Olfactory sensations awake vague and half-understood perceptions, which are accompanied by very strong emotion. The emotion dominates us, but the sensation which was the cause of it remains unperceived." Even in the same individual there are wide variations in the sensitiveness to odors at different times, more especially as regards faint odors; Passy (*_L'Année Psychologique_*, 1895, p. 387) brings forward some observations on this point.

Maudsley noted the peculiarly suggestive power of odors; "there are certain smells," he remarked, "which never fail to bring back to me instantly and visibly scenes of my boyhood"; many of us could probably say the same. Another writer (E. Dillon, "A Neglected Sense," *_Nineteenth Century_*, April, 1894) remarks that "no sense has a stronger power of suggestion."

Ribot has made an interesting investigation as to the prevalence and nature of the emotional memory of odors (*_Psychology of the Emotions_*, Chapter XI). By "emotional memory" is meant the spontaneous or voluntary revivability of the image, olfactory or other. (For the general question, see an article by F. Pillon, "La Mémoire Affective, son Importance Théorique et Pratique," *_Revue Philosophique_*, February, 1901; also Paulhan, "Sur la Mémoire Affective," *_Revue Philosophique_*, December, 1902 and January, 1903.) Ribot found that 40 per cent. of persons are

unable to revive any such images of taste or smell; 48 per cent, could revive some; 12 per cent, declared themselves capable of reviving all, or nearly all, at pleasure. In some persons there is no necessary accompanying revival of visual or tactile representations, but in the majority the revived odor ultimately excites a corresponding visual image. The odors most frequently recalled were pinks, musk, violets, heliotrope, carbolic acid, the smell of the country, of grass, etc. Piéron (*_Revue Philosophique_*, December, 1902) has described the special power possessed by vague odors, in his own case, of evoking ancient impressions.

Dr. J.N. Mackenzie (*_American Journal of the Medical Sciences_*, January, 1886) considers that civilization exerts an influence in heightening or encouraging the influence of olfaction as it affects our emotions and judgment, and that, in the same way, as we ascend the social scale the more readily our minds are influenced and perhaps perverted by impressions received through the sense of smell.

Odors are powerful stimulants to the whole nervous system, causing, like other stimulants, an increase of energy which, if excessive or prolonged, leads to nervous exhaustion. Thus, it is well recognized in medicine that the aromatics containing volatile oils (such as anise, cinnamon, cardamoms, cloves, coriander, and peppermint) are antispasmodics and anæsthetics, and that they stimulate digestion, circulation, and the nervous system, in large doses producing depression. The carefully arranged plethysmographic experiments of Shields, at the Johns Hopkins University, have shown that olfactory sensations, by their action on the vasomotor system, cause an increase of blood in the brain and sometimes in addition stimulation of the heart; musk, wintergreen, wood violet, and especially heliotrope were found to act strongly in these ways.[27]

Féré's experiments with the dynamometer and the ergograph have greatly contributed to illustrate the stimulating effects of odors. Thus, he found that smelling musk suffices to double muscular effort. With a number of odorous substances he has found that muscular work is temporarily heightened; when taste stimulation was added the increase of energy, notably when using lemon was "colossal." A kind of "sensorial intoxication" could be produced by the inhalation of odors and the whole system stimulated to greater activity; the visual acuity was increased, and electric and general excitability heightened.[28] Such effects may be

obtained in perfectly healthy persons, though both Shields and Féré have found that in highly nervous persons the effects are liable to be much greater. It is doubtless on this account that it is among civilized peoples that attention is chiefly directed to perfumes, and that under the conditions of modern life the interest in olfaction and its study has been revived.

It is the genuinely stimulant qualities of odorous substances which led to the widespread use of the more potent among them by ancient physicians, and has led a few modern physicians to employ them still. Thus, vanilla, according to Eloy, deserves to be much more frequently used therapeutically than it is, on account of its excitomotor properties; he states that its qualities as an excitant of sexual desire have long been recognized and that Fonssagrives used to prescribe it for sexual frigidity.[29]

FOOTNOTES:

[26] The opinions of psychologists concerning the æsthetic significance of smell, not on the whole very favorable, are brought together and discussed by J.V. Volkelt, "Der Æsthetische Wert der niederen Sinne," *Zeitschrift für Psychologie und Physiologie der Sinnesorgane*, 1902, ht. 3.

In approaching the specifically sexual aspect of odor in the human species we may start from the fundamental fact--a fact we seek so far as possible to disguise in our ordinary social relations--that all men and women are odorous. This is marked among all races. The powerful odor of many, though not all, negroes is well known; it is by no means due to uncleanly habits, and Joest remarks that it is even increased by cleanliness, which opens the pores of the skin; according to Sir H. Johnston, it is most marked in the armpits and is stronger in men than in women. Pruner Bey describes it as "ammoniacal and rancid; it is like the odor of the he-goat." The odor varies not only individually, but according to the tribe; Castellani states that the negress of the Congo has merely a slight "_goût de noisette_" which is agreeable rather than otherwise. Monbuttu women, according to Parke, have a strong Gorgonzola perfume, and Emin told Parke that he could distinguish the members of different tribes by their characteristic odor. In the same way the Nicobarese, according to Man, can distinguish a member of each of the six tribes of the archipelago by smell. The odor of Australian blacks is less strong than that of negroes and has been described as of a phosphoric character. The South American Indians, d'Orbigny stated, have an odor stronger than that of Europeans, though not as strong as most negroes; it is marked, Latham states, even among those who, like the Araucanos, bathe constantly. The Chinese have a musky odor. The odor of many peoples is described as being of garlic.[30]

A South Sea Islander, we are told by Charles de Varigny, on coming to Sydney and seeing the ladies walking about the streets and apparently doing nothing, expressed much astonishment, adding, with a gesture of contempt, "and they have no smell!" It is by no means true, however, that Europeans are odorless. They are, indeed, considerably more odorous than are many other races,--for instance, the Japanese,--and there is doubtless some association between the greater hairiness of Europeans and their marked odor, since the sebaceous glands are part of the hair apparatus. A Japanese anthropologist, Adachi, has published an interesting study on the odor of Europeans,[31] which he describes as a strong and pungent smell,--sometimes sweet, sometimes bitter,--of varying strength in different individuals, absent in children and the aged, and having its chief focus in the armpits, which, however carefully they are washed, immediately become odorous again. Adachi has found that the sweat-glands are larger in Europeans than in the Japanese, among whom a strong personal odor is so uncommon that "armpit stink" is a disqualification for the army. It is certainly true that the white races smell less strongly than most of the dark races, odor seeming to be correlated to some extent with intensity of pigmentation, as well as with hairiness; but even the most scrupulously clean Europeans all smell. This fact may not always be obvious to human nostrils, apart from intimate contact, but it is well known to dogs, to whom their masters are recognizable by smell. When Hue traveled in Tibet in Chinese disguise he was not detected by the natives, but the dogs recognized him as a foreigner by his smell and barked at him. Many Chinese can tell by smell when a European has been in a room.[32] There are, however, some Europeans who can recognize and distinguish their friends by smell. The case has been recorded of a man who with bandaged eyes could recognize his acquaintances, at the distance of several paces, the moment they entered the room. In another case a deaf and blind mute woman in Massachusetts knew all her acquaintances by smell, and could sort linen after it came from the wash by the odor alone. Governesses have been known to be able when blindfolded to recognize the ownership of their pupil's garments by smell; such a case is known to me. Such odor is usually described as being agreeable, but not one person in fifty, it is stated, is able to distinguish it with sufficient precision to use it as a method of recognition. Among some races, however this aptitude would appear to be better developed. Dr. C.S. Myers at Sarawak noted that his Malay boy sorted the clean linen according to the skin-odor of the wearer.[33] Chinese servants are said to do the same, as well as Australians and natives of Luzon.[34]

Although the distinctively individual odor of most persons is not

sufficiently marked to be generally perceptible, there are cases in which it is more distinct to all nostrils. The most famous case of this kind is that of Alexander the Great, who, according to Plutarch, exhaled so sweet an odor that his tunics were soaked with aromatic perfume (*_Convivalium Disputationum_*, lib. I, quest. 6). Malherbe, Cujas, and Haller are said to have diffused a musky odor. The agreeable odor of Walt Whitman has been remarked by Kennedy and others. The perfume exhaled by many holy men and women, so often noted by ancient writers (discussed by Görres in the second volume of his *_Christliche Mystik_*) and which has entered into current phraseology as a merely metaphorical "odor of sanctity," was doubtless due, as Hammond first pointed out, to abnormal nervous conditions, for it is well known that such conditions affect the odor, and in insanity, for instance, the presence is noted of bodily odors which have sometimes even been considered of diagnostic importance. J.B. Friedreich, *_Allgemeine Diagnostik der Psychischen Krankheiten_*, second edition, 1832, pp. 9-10, quotes passages from various authors on this point, which he accepts; various writers of more recent date have made similar observations.

The odor of sanctity was specially noted at death, and was doubtless confused with the *_odor mortis_*, which frequently precedes death and by some is regarded as an almost certain indication of its approach. In the *_British Medical Journal_*, for May and June, 1898, will be found letters from several correspondents substantiating this point. One of these correspondents (Dr. Tuckey, of Tywardreath, Cornwall) mentions that he has in Cornwall often seen ravens flying over houses in which persons lay dying, evidently attracted by a characteristic odor.

It must be borne in mind, however, that, while every person has, to a sensitive nose, a distinguishing odor, we must regard that odor either as but one of the various sensations given off by the body, or else as a combination of two or more of these emanations. The body in reality gives off a number of different odors. The most important of these are: (1) the general skin odor, a faint, but agreeable, fragrance often to be detected on the skin even immediately after washing; (2) the smell of the hair and scalp; (3) the odor of the breath; (4) the odor of the armpit; (5) the odor of the feet; (6) the perineal odor; (7) in men the odor of the preputial smegma; (8) in women the odor of the mons veneris, that of

vulvar smegma, that of vaginal mucus, and the menstrual odor. All these are odors which may usually be detected, though sometimes only in a very faint degree, in healthy and well-washed persons under normal conditions. It is unnecessary here to take into account the special odors of various secretions and excretions.[35]

It is a significant fact, both as regards the ancestral sexual connections of the body odors and their actual sexual associations to-day, that, as Hippocrates long ago noted, it is not until puberty that they assume their adult characteristics. The infant, the adult, the aged person, each has his own kind of smell, and, as Monin remarks, it might be possible, within certain limits, to discover the age of a person by his odor. Jorg in 1832 pointed out that in girls the appearance of a specific smell of the excreta indicates the establishment of puberty, and Kaan, in his *_Psychopathia Sexualis_*, remarked that at puberty "the sweat gives out a more acrid odor resembling musk." In both sexes puberty, adolescence, early manhood and womanhood are marked by a gradual development of the adult odor of skin and excreta, in general harmony with the secondary sexual development of hair and pigment. Venturi, indeed, has, not without reason, described the odor of the body as a secondary sexual character.[36] It may be added that, as is the case with the pigment in various parts of the body in women, some of these odors tend to become exaggerated in sympathy with sexual and other emotional states.

The odor of the infant is said to be of butyric acid; that of old people to resemble dry leaves. Continent young men have been said by many ancient writers to smell more strongly than the unchaste, and some writers have described as "seminal odor"--an odor resembling that of animals in heat, faintly recalling that of the he-goat, according to Venturi--the exhalations of the skin at such times.

During sexual excitement, as women can testify, a man very frequently, if not normally, gives out an odor which, as usually described, proceeds from the skin, the breath, or both. Grimaldi states that it is as of rancid butter; others say it resembles chloroform. It is said to be sometimes perceptible for a distance of several feet and to last for several hours after coitus. (Various quotations are given by Gould and Pyle, *_Anomalies and Curiosities of Medicine_*, section on "Human Odors," pp. 397-403.) St. Philip Neri is said to have been able to recognize a chaste man by smell.

During menstruation girls and young women frequently give off an odor which is quite distinct from that of the menstrual fluid, and is specially marked in the breath, which may smell of chloroform or violets. Pouchet (confirmed by Raciborski, *Traité de la Menstruation*, 1868, p. 74) stated that about a day before the onset of menstruation a characteristic smell is exuded. Menstruating girls are also said sometimes to give off a smell of leather. Aubert, of Lyons (as quoted by Galopin), describes the odor of the skin of a woman during menstruation as an agreeable aromatic or acidulous perfume of chloroform character. By some this is described as emanating especially from the armpits. Sandras (quoted by Raciborski) knew a lady who could always tell by a sensation of faintness and *malaise*--apparently due to a sensation of smell--when she was in contact with a menstruating woman. I am acquainted with a man, having strong olfactory sympathies and antipathies, who detects the presence of menstruation by smell. It is said that Hortense Baré, who accompanied her lover, the botanist Commerson, to the Pacific disguised as a man, was recognized by the natives as a woman by means of smell.

Women, like men, frequently give out an odor during coitus or strong sexual excitement. This odor may be entirely different from that normally emanating from the woman, of an acid or hircine character, and sufficiently strong to remain in a room for a considerable period. Many of the ancient medical writers (as quoted by Schurigius, *Parthenologia*, p. 286) described the goatly smell produced by venery, especially in women; they regarded it as specially marked in harlots and in the newly married, and sometimes even considered it a certain sign of defloration. The case has been recorded of a woman who emitted a rose odor for two days after coitus (McBride, quoted by Kiernan in an interesting summary, "Odor in Pathology," *Doctor's Magazine*, December, 1900). There was, it is said (*Journal des Savans* 1684, p. 39, quoting from the *Journal d'Angleterre*) a monk in Prague who could recognize by smell the chastity of the women who approached him. (This monk, it is added, when he died, was composing a new science of odors.)

Gustav Klein (as quoted by Adler, *Die Mangelhafte Geschlechtsempfindungen des Weibes*, p. 25) argues that the

special function of the glands at the vulvar orifice--the _glandulae vestibulares majores_--is to give out an odorous secretion to act as an attraction to the male, this relic of sexual periodicity no longer, however, playing an important part in the human species. The vulvar secretion, however, it may be added, still has a more aromatic odor than the vaginal secretion, with its simple mucous odor, very clearly perceived during parturition.

It may be added that we still know extremely little concerning the sexual odors of women among primitive peoples. Ploss and Bartels are only able to bring forward (_Das Weib_, 1901, bd. 1, p. 218) a statement concerning the women of New Caledonia, who, according to Moncelon, when young and ardent, give out during coitus a powerful odor which no ablution will remove. In abnormal states of sexual excitement such odor may be persistent, and, according to an ancient observation, a nymphomaniac, whose periods of sexual excitement lasted all through the spring-time, at these periods always emitted a goatlike odor. It has been said (G. Tourdes, art. "Aphrodisie," _Dictionnaire Encyclopédique des Sciences Médicales_) that the erotic temperament is characterized by a special odor.

If the body odors tend to develop at puberty, to be maintained during sexual life, especially in sympathy with conditions of sexual disturbance, and to become diminished in old age, being thus a kind of secondary sexual character, we should expect them to be less marked in those cases in which the primary sexual characters are less marked. It is possible that this is actually the case. Hagen, in his _Sexuelle Osphrésiologie_, quotes from Roubaud's _Traité de l'Impuissance_ the statement that the body odor of the castrated differs from that of normal individuals. Burdach had previously stated that the odor of the eunuch is less marked than that of the normal man.

It is thus possible that defective sexual development tends to be associated with corresponding olfactory defect. Heschl[37] has reported a case in which absence of both olfactory nerves coincided with defective development of the sexual organs. Féré remarks that the impotent show a repugnance for sexual odors. Dr. Kiernan informs me that in women after oöphorectomy he has noted a tendency to diminished (and occasionally increased) sense of smell. These questions, however, await more careful and extended observation.

A very significant transition from the phenomena of personal odor to those of sexual attraction by personal odor is to be found in the fact that among the peoples inhabiting a large part of the world's surface the ordinary salutation between friends is by mutual smelling of the person. In some form or another the method of salutation by applying the nose to the nose, face, or hand of a friend in greeting is found throughout a large part of the Pacific, among the Papuans, the Eskimo, the hill tribes of India, in Africa, and elsewhere.[38] Thus, among a certain hill tribe in India, according to Lewin, they smell a friend's cheek: "in their language, they do not say, 'Give me a kiss,' but they say 'Smell me.'" And on the Gambia, according to F. Moore, "When the men salute the women, they, instead of shaking their hands, put it up to their noses, and smell twice to the back of it." Here we have very clearly a recognition of the emotional value of personal odor widely prevailing throughout the world. The salutation on an olfactory basis may, indeed, be said to be more general than the salutation on a tactile basis on which European handshaking rests, each form involving one of the two most intimate and emotional senses. The kiss may be said to be a development proceeding both from the olfactory and the tactile bases, with perhaps some other elements as well, and is too complex to be regarded as a phenomenon of either purely tactile or purely olfactory origin.[39]

As the sole factor in sexual selection olfaction must be rare. It is said that Asiatic princes have sometimes caused a number of the ladies to race in the seraglio garden until they were heated; their garments have then been brought to the prince, who has selected one of them solely by the odor.[40] There was here a sexual selection mainly by odor. Any exclusive efficacy of the olfactory sense is rare, not so much because the impressions of this sense are inoperative, but because agreeable personal odors are not sufficiently powerful, and the olfactory organ is too obtuse, to enable smell to take precedence of sight. Nevertheless, in many people, it is probable that certain odors, especially those that are correlated with a healthy and sexually desirable person, tend to be agreeable; they are fortified by their association with the loved person, sometimes to an irresistible degree; and their potency is doubtless increased by the fact, to which reference has already been made, that many odors, including some bodily odors, are nervous stimulants.

It is possible that the sexual associations of odors have been still further fortified by a tendency to correlation between a high development of the olfactory organ and a high development of the sexual apparatus. An

association between a large nose and a large male organ is a very ancient observation and has been verified occasionally in recent times. There is normally at puberty a great increase in the septum of the nose, and it is quite conceivable, in view of the sympathy, which, as we shall see, certainly exists between the olfactory and sexual region, that the two regions may develop together under a common influence.

The Romans firmly believed in the connection between a large nose and a large penis. "Noscitur e naso quanta sit hasta viro," stated Ovid. This belief continued to prevail, especially in Italy, through the middle ages; the physiognomists made much of it, and licentious women (like Joanna of Naples) were, it appears, accustomed to bear it in mind, although disappointment is recorded often to have followed. (See e.g., the quotations and references given by J.N. Mackenzie, "Physiological and Pathological Relations between the Nose and the Sexual Apparatus in Man." *Johns Hopkins Hospital Bulletin*, No. 82, January, 1898; also Hagen, *Sexuelle Osphrésologie*, pp. 15-19.) A similar belief as to the association between the sexual impulse in women and a long nose was evidently common in England in the sixteenth century, for in Massinger's *Emperor of the East* (Act II, Scene I) we read,

"Her nose, which by its length assures me
Of storms at midnight if I fail to pay her
The tribute she expects."

At the present day, a proverb of the Venetian people still embodies the belief in the connection between a large nose and a large sexual member.

The probability that such an association tends in many cases to prevail is indicated not only by the beliefs of antiquity, when more careful attention was paid to these matters, but by the testimony of various modern observers, although it does not appear that any series of exact observations have yet been made.

It may be noted that Marro, in his careful anthropological study of criminals (*I Caratteri dei Delinquenti*), found no class of criminals with so large a proportion alike of anomalies of the nose and anomalies of the genital organs as sexual offenders.

However this may be, it is less doubtful that there is a very intimate relation both in men and women between the olfactory mucous membrane of the nose and the whole genital apparatus, that they frequently show a sympathetic action, that influences acting on the genital sphere will affect the nose, and occasionally, it is probable, influences acting on the nose reflexly affect the genital sphere. To discuss these relationships would here be out of place, since specialists are not altogether in agreement concerning the matter. A few are inclined to regard the association as extremely intimate, so that each region is sensitive even to slight stimuli applied to the other region, while, on the other hand, many authorities ignore altogether the question of the relationship. It would appear, however, that there really is, in a considerable number of people at all events, a reflex connection of this kind. It has especially been noted that in many cases congestion of the nose precedes menstruation.

Bleeding of the nose is specially apt to occur at puberty and during adolescence, while in women it may take the place of menstruation and is sometimes more apt to occur at the menstrual periods; disorders of the nose have also been found to be aggravated at these periods. It has even been possible to control bleeding of the nose, both in men and women, by applying ice to the sexual regions. In both men and women, again, cases have been recorded in which sexual excitement, whether of coitus or masturbation, has been followed by bleeding of the nose. In numerous cases it is followed by slight congestive conditions of the nasal passages and especially by sneezing. Various authors have referred to this phenomenon; I am acquainted with a lady in whom it is fairly constant.[41] Féré records the case of a lady, a nervous subject, who began to experience intense spontaneous sexual excitement shortly after marriage, accompanied by much secretion from the nose.[42] J.N. Mackenzie is acquainted with a number of such cases, and he considers that the popular expression "bride's cold" indicates that this effect of strong sexual excitement is widely recognized.

The late Professor Hack, of Freiburg, in 1884, called general medical attention to the intimate connection between the nose and states of nervous hyperexcitability in various parts of the body, although such a connection had been recognized for many centuries in medical literature. While Hack and his disciples thus gave prominence to this association, they undoubtedly greatly exaggerated its importance and significance. (Sir Felix Semon, British Medical Journal, November 9, 1901.) Even many workers

who have more recently further added to our knowledge have also, as sometimes happens with enthusiasts, unduly strained their own data. Starting from the fact that in women during menstruation examination of the nose reveals a degree of congestion not found during the rest of the month, Fliess (*Die Beziehungen zwischen Nase und Weiblichen Geschlechtsorganen*, 1897), with the help of a number of elaborate and prolonged observations, has reached conclusions which, while they seem to be hazardous at some points, have certainly contributed to build up our knowledge of this obscure subject. Schiff (*Wiener klinische Wochenschrift*, 1900, p. 58, summarized in *British Medical Journal*, February 16, 1901), starting from a skeptical standpoint, has confirmed some of Fliess's results, and in a large number of cases controlled painful menstruation by painting with cocaine the so-called "genital spots" in the nose, all possibility of suggestion being avoided. Ries, of Chicago, has been similarly successful with the method of Fliess (*American Gynecology*, vol. iii, No. 4, 1903). Benedikt (*Wiener medicinische Wochenschrift*, No. 8, 1901, summarized in *Journal of Medical Science*, October, 1901), while pointing out that the nose is not the only organ in sympathetic relation with the sexual sphere, suggests that the mechanism of the relationship is involved in the larger problem of the harmony in growth and in nutrition of the different parts of the organism. In this way, probably, we may attach considerable significance to the existence of a kind of erectile tissue in the nose.

An interesting example of a reflex influence from the nose affecting the genital sphere has been brought forward by Dr. E.S. Talbot, of Chicago: "A 56-year-old man was operated on (September 1, 1903) for the removal of the left cartilage of the septum of the nose owing to a previous traumatic fracture at the sixteenth year. No pain was experienced until two years ago, when a continual soreness occurred at the apical end of the fracture during the winter months. The operation was decided upon fearing more serious complications. The parts were cocaineized. No pain was experienced in the operation except at one point at the lower posterior portion near the floor of the nose. A profound shock to the general system followed. The reflex influence of the pain upon the genital organs caused semen to flow continually for three weeks. Treatment of general motor irritability with camphor monobromate and conium, on consultation with Dr. Kiernan, checked

the flow. The discharge produced spinal neurasthenia. The legs and feet felt heavy. Erythromelalgia caused uneasiness. The patient walked with difficulty. The tired feeling in the feet and limbs was quite noticeable four months after the operation, although the pain had, to a great extent diminished." (Chicago Academy of Medicine, January, 1904, and private letter.)

J.N. Mackenzie has brought together a great many original observations, together with interesting quotations from old medical literature, in his two papers: "The Pathological Nasal Reflex" (*New York Medical Journal*, August 20, 1887) and "The Physiological and Pathological Relations between the Nose and the Sexual Apparatus of Man" (*Johns Hopkins Hospital Bulletin*, January 1, 1898). A number of cases have also been brought together from the literature by G. Endriss in his Inaugural Dissertation, *Die bisherigen Beobachtungen von Physiologischen und Pathologischen Beziehungen der oberen Luftwege zu den Sexualorganen*, Teil. II, Würzburg, 1892.

The intimate association between the sexual centers and the olfactory tract is well illustrated by the fact that this primitive and ancient association tends to come to the surface in insanity. It is recognized by many alienists that insanity of a sexual character is specially liable to be associated with hallucinations of smell.

Many eminent alienists in various countries are very decidedly of the opinion that there is a special tendency to the association of olfactory hallucinations with sexual manifestations, and, although one or two authorities have expressed doubt on the matter, the available evidence clearly indicates such an association. Hallucinations of smell are comparatively rare as compared to hallucinations of sight and hearing; they are commoner in women than in men and they not infrequently occur at periods of sexual disturbance, at adolescence, in puerperal fever, at the change of life, in women with ovarian troubles, and in old people troubled with sexual desires or remorse for such desires. They have often been noted as specially frequent in cases of excessive masturbation.

Krafft-Ebing, who found olfactory hallucinations common in various sexual states, considers that they are directly dependent on sexual excitement (*Allgemeine Zeitschrift für Psychiatrie*,

bd. 34, ht. 4, 1877). Conolly Norman believes in a distinct and frequent association between olfactory hallucinations and sexual disturbance (*Journal of Mental Science*, July, 1899, p. 532). Savage is also impressed by the close association between sexual disturbance or changes in the reproductive organs and hallucinations of smell as well as of touch. He has found that persistent hallucinations of smell disappeared when a diseased ovary was removed, although the patient remained insane. He considers that such hallucinations of smell are allied to reversions. (G.H. Savage, "Smell, Hallucinations of," Tuke's *Dictionary of Psychological Medicine*; cf. the same author's manual of *Insanity and Allied Neuroses*.) Matusch, while not finding olfactory hallucinations common at the climacteric, states that when they are present they are connected with uterine trouble and sexual craving. He finds them more common in young women. (Matusch, "Der Einfluss des Climacterium auf Entstehung und Form der Geistesstörung," *Allgemeine Zeitschrift für Psychiatrie*, vol. xlvi, ht. 4). Féré has related a significant case of a young man in whom hallucinations of smell accompanied the sexual orgasm; he subsequently developed epilepsy, to which the hallucination then constituted the aura (*Comptes Rendus de la Société de Biologie*, December, 1896). The prevalence of a sexual element in olfactory hallucinations has been investigated by Bullen, who examined into 95 cases of hallucinations of smell among the patients in several asylums. (In a few cases there were reasons for believing that peripheral conditions existed which would render these hallucinations more strictly illusions.) Of these, 64 were women. Sixteen of the women were climacteric cases, and 3 of them had sexual hallucinations or delusions. Fourteen other women (chiefly cases of chronic delusional insanity) had sexual delusions. Altogether, 31 men and women had sexual delusions. This is a large proportion. Bullen is not, however, inclined to admit any direct connection between the reproductive system and the sense of smell. He finds that other hallucinations are very frequently associated with the olfactory hallucinations, and considers that the co-existence of olfactory and sexual troubles simply indicates a very deep and widespread nervous disturbance. (F. St. John Bullen, "Olfactory Hallucinations in the Insane," *Journal of Mental Science*, July, 1899.) In order to elucidate the matter fully we require further precise inquiries on the lines Bullen has laid down.

It may be of interest to note, in this connection, that smell and taste hallucinations appear to be specially frequent in forms of religious insanity. Thus, Dr. Zurcher, in her inaugural dissertation on Joan of Arc (*Jeanne d'Arc*, Leipzig, 1895, p. 72), estimates that on the average in such insanity nearly 50 per cent, of the hallucinations affect smell and taste; she refers also to the olfactory hallucinations of great religious leaders, Francis of Assisi, Katherina Emmerich, Lazzaretti, and the Anabaptists.

It may well be, as Zwaardemaker has suggested in his *Physiologie des Geruchs*, that the nasal congestion at menstruation and similar phenomena are connected with that association of smell and sexuality which is observable throughout the whole animal world, and that the congestion brings about a temporary increase of olfactory sensitiveness during the stage of sexual excitation.[43] Careful investigation of olfactory acuteness would reveal the existence of such menstrual heightening of its acuity.

In a few exceptional, but still quite healthy people, smell would appear to possess an emotional predominance which it cannot be said to possess in the average person. These exceptional people are of what Binet in his study of sexual fetichism calls olfactive type; such persons form a group which, though of smaller size and less importance, is fairly comparable to the well-known groups of visual type, of auditory type, and of psychomotor type. Such people would be more attentive to odors, more moved by olfactory sympathies and antipathies, than are ordinary people. For these, it may well be, the supremacy accorded to olfactory influences in Jäger's *Entdeckung der Seele*, though extravagantly incorrect for ordinary persons, may appear quite reasonable.

It is certain also that a great many neurasthenic people, and particularly those who are sexually neurasthenic, are peculiarly susceptible to olfactory influences. A number of eminent poets and novelists--especially, it would appear, in France--seem to be in this case. Baudelaire, of all great poets, has most persistently and most elaborately emphasized the imaginative and emotional significance of odor; the *Fleurs du Mal* and many of the *Petits Poèmes en Prose* are, from this point of view, of great interest. There can be no doubt that in Baudelaire's own imaginative and emotional life the sense of smell played a highly important part; and that, in his own words, odor was to him what music is to others. Throughout Zola's novels--and perhaps more especially

in *_La Faute de l'Abbé Mouret_*--there is an extreme insistence on odors of every kind. Prof. Leopold Bernard wrote an elaborate study of this aspect of Zola's work[44]; he believed that underlying Zola's interest in odors there was an abnormally keen olfactory sensibility and large development of the olfactory region of the brain. Such a supposition is, however, unnecessary, and, as a matter of fact, a careful examination of Zola's olfactory sensibility, conducted by M. Passy, showed that it was somewhat below normal.[45] At the same time it was shown that Zola was really a person of olfactory psychic type, with a special attention to odors and a special memory for them; as is frequently the case with perfumers with less than normal olfactory acuity he possessed a more than normal power of discriminating odors; it is possible that in early life his olfactory acuity may also have been above normal. In the same way Nietzsche, in his writings, shows a marked sensibility, and especially antipathy, as regards odors, which has by some been regarded as an index to a real physical sensibility of abnormal keenness; according to Möbius, however, there was no reason for supposing this to be the case.[46] Huysmans, who throughout his books reveals a very intense preoccupation with the exact shades of many kinds of sensory impressions, and an apparently abnormally keen sensibility to them, has shown a great interest in odors, more especially in an oft-quoted passage in *_A Rebours_*. The blind Milton of "Paradise Lost" (as the late Mr. Grant Allen once remarked to me), dwells much on scents; in this case it is doubtless to the blindness and not to any special organic predisposition that we must attribute this direction of sensory attention.[47] Among our older English poets, also, Herrick displays a special interest in odors with a definite realization of their sexual attractiveness.[48] Shelley, who was alive to so many of the unusual æsthetic aspects of things, often shows an enthusiastic delight in odors, more especially those of flowers. It may, indeed, be said that most poets--though to a less degree than those I have mentioned--devote a special attention to odors, and, since it has been possible to describe smell as the sense of imagination, this need not surprise us. That Shakespeare, for instance, ranked this sense very high indeed is shown by various passages in his works and notably by Sonnet LIV: "O, how much more doth beauty beauteous seem?"--in which he implicitly places the attraction of odor on at least as high a level as that of vision.[49]

A neurasthenic sensitiveness to odors, specially sexual odors, is frequently accompanied by lack of sexual vigor. In this way we may account for the numerous cases in which old men in whom sexual desire survives the loss of virile powers--probably somewhat abnormal persons at the outset--find satisfaction in sexual odors. Here, also, we have the basis

for olfactory fetichism. In such fetichism the odor of the woman alone, whoever she may be and however unattractive she may be, suffices to furnish complete sexual satisfaction. In many, although not all, of those cases in which articles of women's clothing become the object of fetichistic attraction, there is certainly an olfactory element due to the personal odor attaching to the garments.[50]

Olfactory influences play a certain part in various sexually abnormal tendencies and practices which do not proceed from an exclusively olfactory fascination. Thus, *_cunnilingus_* and *_fellatio_* derive part of their attraction, more especially in some individuals, from a predilection for the odors of the sexual parts. (See, e.g., Moll, *_Untersuchungen über die Libido Sexualis_*, bd. 1, p. 134.) In many cases smell plays no part in the attraction; "I enjoy *_cunnilingus_*, if I like the girl very much," a correspondent writes, "*_in spite_* of the smell." We may associate this impulse with the prevalence of these practices among sexual inverts, in whom olfactory attractions are often specially marked. Those individuals, also, who are sexually affected by the urinary and alvine excretions ("*_renifleurs_*," "*_stereoraires_*," etc.) are largely, though not necessarily altogether, moved by olfactory impressions. The attraction was, however, exclusively olfactory in the case of the young woman recorded by Moraglia (*_Archivio di Psichiatria_*, 1892, p. 267), who was irresistibly excited by the odor of the fermented urine of men, and possibly also in the case narrated to Moraglia by Prof. L. Bianchi (ib. p. 568), in which a wife required flatus from her husband.

The sexual pleasure derived from partial strangulation (discussed in the study of "Love and Pain" in a previous volume) may be associated with heightened olfactory sexual excitation. Dr. Kiernan, who points this out to me, has investigated a few neuropathic patients who like to have their necks squeezed, as they express it, and finds that in the majority the olfactory sensibility is thus intensified.

Even in ordinary normal persons, however, there can be no doubt that personal odor tends to play a not inconsiderable part in sexual attractions and sexual repulsions. As a sexual excitant, indeed, it comes far behind the stimuli received through the sense of sight. The comparative bluntness of the sense of smell in man makes it difficult for

olfactory influence to be felt, as a rule, until the preliminaries of courtship are already over; so that it is impossible for smell ever to possess the same significance in sexual attraction in man that it possesses in the lower animals. With that reservation there can be no doubt that odor has a certain favorable or unfavorable influence in sexual relationships in all human races from the lowest to the highest. The Polynesian spoke with contempt of those women of European race who "have no smell," and in view of the pronounced personal odor of so many savage peoples as well as of the careful attention which they so often pay to odors, we may certainly assume, even in the absence of much definite evidence, that smell counts for much in their sexual relationships. This is confirmed by such practices as that found among some primitive peoples--as, it is stated, in the Philippines--of lovers exchanging their garments to have the smell of the loved one about them. In the barbaric stages of society this element becomes self-conscious and is clearly avowed; personal odors are constantly described with complacency, sometimes as mingled with the lavish use of artificial perfumes, in much of the erotic literature produced in the highest stages of barbarism, especially by Eastern peoples living in hot climates; it is only necessary to refer to the *Song of Songs*, the *Arabian Nights*, and the Indian treatises on love. Even in some parts of Europe the same influence is recognized in the crudest animal form, and Krauss states that among the Southern Slavs it is sometimes customary to leave the sexual parts unwashed because a strong odor of these parts is regarded as a sexual stimulant. Under the usual conditions of life in Europe personal odor has sunk into the background; this has been so equally under the conditions of classic, mediæval, and modern life. Personal odor has been generally regarded as unæsthetic; it has, for the most part, only been mentioned to be reprobated, and even those poets and others who during recent centuries have shown a sensitive delight and interest in odors--Herrick, Shelley, Baudelaire, Zola, and Huysmans--have seldom ventured to insist that a purely natural and personal odor can be agreeable. The fact that it may be so, and that for most people such odors cannot be a matter of indifference in the most intimate of all relationships, is usually only to be learned casually and incidentally. There can be no doubt, however, that, as Kiernan points out, the extent to which olfaction influences the sexual sphere in civilized man has been much underestimated. We need not, therefore, be surprised at the greater interest which has recently been taken in this subject. As usually happens, indeed, there has been in some writers a tendency to run to the opposite extreme, and we cannot, with Gustav Jäger, regard the sexual instinct as mainly or altogether an olfactory matter.

Of the Padmini, the perfect woman, the "lotus woman," Hindu writers say that "her sweat has the odor of musk," while the vulgar woman, they say, smells of fish (_Kama Sutra of Vatsyayana_). Ploss and Bartels (_Das Weib_, 1901, p. 218) bring forward a passage from the Tamil _Kokkôgam_, minutely describing various kinds of sexual odor in women, which they regard as resting on sound observation.

Four things in a woman, says the Arab, should be perfumed: the mouth, the armpits, the pudenda, and the nose. The Persian poets, in describing the body, delighted to use metaphors involving odor. Not only the hair and the down on the face, but the chin, the mouth, the beauty spots, the neck, all suggested odorous images. The epithets applied to the hair frequently refer to musk, ambergris, and civet. (_Anis El-Ochchâq_ translated by Huart, _Bibliothèque de l'Ecole des Hautes Etudes_, fasc. 25, 1875.)

The Hebrew _Song of Songs_ furnishes a typical example of a very beautiful Eastern love-poem in which the importance of the appeal to the sense of smell is throughout emphasized. There are in this short poem as many as twenty-four fairly definite references to odors,--personal odors, perfumes, and flowers,--while numerous other references to flowers, etc., seem to point to olfactory associations. Both the lover and his sweetheart express pleasure in each other's personal odor.

"My beloved is unto me," she sings, "as a bag of myrrh
That lieth between my breasts;
My beloved is unto me as a cluster of henna flowers
In the vineyard of En-gedi."

And again: "His cheeks are as a bed of spices [or balsam], as banks of sweet herbs." While of her he says: "The smell of thy breath [or nose] is like apples."

Greek and Roman antiquity, which has so largely influenced the traditions of modern Europe, was lavish in the use of perfumes, but showed no sympathy with personal odors. For the Roman satirists, like Martial, a personal odor is nearly always an unpleasant odor, though, there are a few allusions in classic

literature recognizing bodily smell as a sexual attraction. Ovid, in his *Ars Amandi* (Book III), says it is scarcely necessary to remind a lady that she must not keep a goat in her armpits: "*ne trux caper iret in alas*." "*Mulier tum bene olet ubi nihil olet*" is an ancient dictum, and in the sixteenth century Montaigne still repeated the same saying with complete approval.

A different current of feeling began to appear with the new emotional movement during the eighteenth century. Rousseau called attention to the importance of the olfactory sense, and in his educational work, *Emile* (Bk. II), he referred to the odor of a woman's "*cabinet de toilette*" as not so feeble a snare as is commonly supposed. In the same century Casanova wrote still more emphatically concerning the same point; in the preface to his *Mémoires* he states: "I have always found sweet the odor of the women I have loved"; and elsewhere: "There is something in the air of the bedroom of the woman one loves, something so intimate, so balsamic, such voluptuous emanations, that if a lover had to choose between Heaven and this place of delight his hesitation would not last for a moment" (*Mémoires*, vol. iii). In the previous century, in England, Sir Kenelm Digby, in his interesting and remarkable *Private Memoirs*, when describing a visit to Lady Venetia Stanley, afterward his wife, touches on personal odor as an element of attraction; he had found her asleep in bed and on her breasts "did glisten a few drops of sweatlike diamond sparks, and had a more fragrant odor than the violets or primroses whose season was newly passed."

In 1821 Cadet-Devaux published, in the *Revue Encyclopédique*, a study entitled "De l'atmosphère de la Femme et de sa Puissance," which attracted a great deal of attention in Germany as well as in France; he considered that the exhalations of the feminine body are of the first importance in sexual attraction.

Prof. A. Galopin in 1886 wrote a semiscientific book, *Le Parfum de la Femme*, in which the sexual significance of personal odor is developed to its fullest. He writes with enthusiasm concerning the sweet and health-giving character of the natural perfume of a beloved woman, and the mischief done both to health and love by the use of artificial perfumes. "The purest marriage that can be contracted between a man and a woman," he asserts (p. 157) "is that engendered by olfaction and sanctioned by a common

assimilation in the brain of the animated molecules due to the secretion and evaporation of two bodies in contact and sympathy."

In a book written during the first half of the nineteenth century which contains various subtle observations on love we read, with reference to the sweet odor which poets have found in the breath of women: "In reality many women have an intoxicatingly agreeable breath which plays no small part in the love-compelling atmosphere which they spread around them" (*Eros oder Wörterbuch über die Physiologie*, 1849, Bd. 1, p. 45).

Most of the writers on the psychology of love at this period, however, seem to have passed over the olfactory element in sexual attraction, regarding it probably as too unæsthetic. It receives no emphasis either in Sénancour's *De l'Amour* or Stendhal's *De l'Amour* or Michelet's *L'Amour*.

The poets within recent times have frequently referred to odors, personal and other, but the novelists have more rarely done so. Zola and Huysmans, the two novelists who have most elaborately and insistently developed the olfactory side of life, have dwelt more on odors that are repulsive than on those that are agreeable. It is therefore of interest to note that in a few remarkable novels of recent times the attractiveness of personal odor has been emphasized. This is notably so in Tolstoy's *War and Peace*, in which Count Peter suddenly resolves to marry Princess Helena after inhaling her odor at a ball. In d'Annunzio's *Trionfo della Morte* the seductive and consoling odor of the beloved woman's skin is described in several passages; thus, when Giorgio kissed Ippolita's arms and shoulders, we are told, "he perceived the sharp and yet delicate perfume of her, the perfume of the skin that in the hour of joy became intoxicating as that of the tuberose, and a terrible lash to desire."

When we are dealing with the sexual significance of personal odors in man there is at the outset an important difference to be noticed in comparison with the lower mammals. Not only is the significance of odor altogether very much less, but the focus of olfactory attractiveness has been displaced. The centre of olfactory attractiveness is not, as usually among animals, in the sexual region, but is transferred to the upper part of the body. In this respect the sexual olfactory allurement in man resembles

what we find in the sphere of vision, for neither the sexual organs of man nor of woman are usually beautiful in the eyes of the opposite sex, and their exhibition is not among us regarded as a necessary stage in courtship. The odor of the body, like its beauty, in so far as it can be regarded as a possible sexual allurement, has in the course of development been transferred to the upper parts. The careful concealment of the sexual region has doubtless favored this transfer. It has thus happened that when personal odor acts as a sexual allurement it is the armpit, in any case normally the chief focus of odor in the body, which mainly comes into play, together with the skin and the hair.

Aubert, of Lyons, noted that during menstruation the odor of the armpits may become more powerful, and describes it as being at this time an aromatic odor of acidulous or chloroform character. Galopin remarks that, while some women's armpits smell of sheep in rut, others, when exposed to the air, have a fragrance of ambergris or violet. Dark persons (according to Gould and Pyle) are said sometimes to exhale a prussic acid odor, and blondes more frequently musk; Galopin associates the ambergris odor more especially with blondes.

While some European poets have faintly indicated the woman's armpit as a centre of sexual attraction, it is among Eastern poets that we may find the idea more directly and naturally expressed. Thus, in a Chinese drama ("The Transmigration of Yo-Chow," *Mercure de France*, No. 8, 1901) we find a learned young doctor addressing the following poem to his betrothed:--

"When I have climbed to the bushy summit of Mount Chao,
I have still not reached to the level of your odorous armpit.
I must needs mount to the sky
Before the breeze brings to me
The perfume of that embalmed nest!"

This poet seems, however, to have been carried to a pitch of enthusiasm unusual even in China, for his future mother-in-law, after expressing her admiration for the poem, remarks: "But who would have thought one could find so many beautiful things under my daughter's armpit!"

The odor of the armpit is the most powerful in the body, sufficiently powerful to act as a muscular stimulant even in the

absence of any direct sexual association. This is indicated by an observation made by Féré, who noticed, when living opposite a laundry, that an old woman who worked near the window would, toward the close of the day, introduce her right hand under the sleeve of the other to the armpit and then hold it to her nose; this she would do about every five minutes. It was evident that the odor acted as a stimulant to her failing energies. Féré has been informed by others who have had occasion to frequent workrooms that this proceeding is by no means uncommon among persons of both sexes. (Féré, *L'Instinct Sexuel*, second edition, p. 135.) I have myself noticed the same gesture very deliberately made in the street by a young English woman of the working class, under circumstances which suggested that it acted as an immediate stimulant in fatigue.

Huysmans--who in his novels has insisted on odors, both those of a personal kind and perfumes, with great precision--has devoted one of the sketches, "Le Gousset," in his *Croquis Parisiens* (1880) to the varying odors of women's armpits. "I have followed this fragrance in the country," he remarks, "behind a group of women gleaners under the bright sun. It was excessive and terrible; it stung your nostrils like an unstoppered bottle of alkali; it seized you, irritating your mucous membrane with a rough odor which had in it something of the relish of wild duck cooked with olives and the sharp odor of the shallot. On the whole, it was not a vile or repugnant emanation; it united, as an anticipated thing, with the formidable odors of the landscape; it was the pure note, completing with the human animals' cry of heat the odorous melody of beasts and woods." He goes on to speak of the perfume of feminine arms in the ball-room. "There the aroma is of ammoniated valerian, of chlorinated urine, brutally accentuated sometimes, even with a slight scent of prussic acid about it, a faint whiff of overripe peaches." These "spice-boxes," however, Huysmans continues, are more seductive when their perfume is filtered through the garments. "The appeal of the balsam of their arms is then less insolent, less cynical, than at the ball where they are more naked, but it more easily uncages the animal in man. Various as the color of the hair, the odor of the armpit is infinitely divisible; its gamut covers the whole keyboard of odors, reaching the obstinate scents of syringa and elder, and sometimes recalling the sweet perfume of the rubbed fingers that have held a cigarette. Audacious and

sometimes fatiguing in the brunette and the black woman, sharp and fierce in the red woman, the armpit is heady as some sugared wines in the blondes." It will be noted that this very exact description corresponds at various points with the remarks of more scientific observers.

Sometimes the odor of the armpit may even become a kind of fetich which is craved for its own sake and in itself suffices to give pleasure. Féré has recorded such a case, in a friend of his own, a man of 60, with whom at one time he used to hunt, of robust health and belonging to a healthy family. On these hunting expeditions he used to tease the girls and women he met (sometimes even rather old women) in a surprising manner, when he came upon them walking in the fields with their short-sleeved chemises exposed. When he had succeeded in introducing his hand into the woman's armpit he went away satisfied, and frequently held the hand to his nose with evident pleasure. After long hesitation Féré asked for an explanation, which was frankly given. As a child he had liked the odor, without knowing why. As a young man women with strong odors had stimulated him to extraordinary sexual exploits, and now they were the only women who had any influence on him. He professed to be able to recognize continence by the odor, as well as the most favorable moment for approaching a woman. Throughout life a cold in the head had always been accompanied by persistent general excitement. (Féré, *L'Instinct Sexuel*, 1902, p. 134.)

We not only have to recognize that in the course of evolution the specific odors of the sexual region have sunk into the background as a source of sexual allurements, we have further to recognize the significant fact that even those personal odors which are chiefly liable under normal circumstances to come occasionally within the conscious sexual sphere, and indeed purely personal odors of all kinds, fail to exert any attraction, but rather tend to cause antipathy, unless some degree of tumescence has already been attained. That is to say, our olfactory experiences of the human body approximate rather to our tactile experiences of it than to our visual experiences. Sight is our most intellectual sense, and we trust ourselves to it with comparative boldness without any undue dread that its messages will hurt us by their personal intimacy; we even court its experiences, for it is the chief organ of our curiosity, as smell is of a dog's. But smell with us has ceased to be a leading channel of intellectual curiosity. Personal odors do not, as vision does, give us

information that is very largely intellectual; they make an appeal that is mainly of an intimate, emotional, imaginative character. They thus tend, when we are in our normal condition, to arouse what James calls the antisexual instinct.

"I cannot understand how people do not see how the senses are connected," said Jenny Lind to J.A. Symonds (Horatio Brown, *J.A. Symonds*, vol. i, p. 207). "What I have suffered from my sense of smell! My youth was misery from my acuteness of sensibility."

Mantegazza discusses the strength of olfactory antipathies (*Fisiologia dell' Odio*, p. 101), and mentions that once when ill in Paraguay he was nursed by an Indian girl of 16, who was fresh as a peach and extremely clean, but whose odor--"a mixture of wild beast's lair and decayed onions"--caused nausea and almost made him faint.

Moll (*Untersuchungen über die Libido Sexualis*, bd. i, p. 135) records the case of a neuropathic man who was constantly rendered impotent by his antipathy to personal body odors. It had very frequently happened to him to be attracted by the face and appearance of a girl, but at the last moment potency was inhibited by the perception of personal odor.

In the case of a man of distinguished ability known to me, belonging to a somewhat neuropathic family, there is extreme sensitiveness to the smell of a woman, which is frequently the most obvious thing to him about her. He has seldom known a woman whose natural perfume entirely suits him, and his olfactory impressions have frequently been the immediate cause of a rupture of relationships.

It was formerly discussed whether strong personal odor constituted adequate ground for divorce. Hagen, who brings forward references on this point (*Sexuelle Osphrésiologie*, pp. 75-83), considers that the body odors are normally and naturally repulsive because they are closely associated with the capryl group of odors, which are those of many of the excretions.

Olfactory antipathies are, however, often strictly subordinated to the individual's general emotional attitude toward the object from which they emanate. This is illustrated in the case, known

to me, of a man who on a hot day entering a steamboat with a woman to whom he was attached seated himself between her and a man, a stranger. He soon became conscious of an axillary odor which he concluded to come from the man and which he felt as disagreeable. But a little later he realized that it proceeded from his own companion, and with this discovery the odor at once lost its disagreeable character.

In this respect a personal odor resembles a personal touch. Two intimate touches of the hand, though of precisely similar physical quality, may in their emotional effects be separated by an immeasurable interval, in dependence on our attitude toward the person from whom they proceed.

Personal odor, in order to make its allurements felt, and not to arouse antipathy, must, in normal persons, have been preceded by conditions which have inhibited the play of the antisexual instinct. A certain degree of tumescence must already have been attained. It is even possible, when we bear in mind the intimate sympathy between the sexual sphere and the nose, that the olfactory organ needs to have its sensibility modified in a form receptive to sexual messages, though such an assumption is by no means necessary. It is when such a faint preliminary degree of tumescence has been attained, however it may have been attained,--for the methods of tumescence, as we know, are innumerable,--that a sympathetic personal odor is enabled to make its appeal. If we analyze the cases in which olfactory perceptions have proved potent in love, we shall nearly always find that they have been experienced under circumstances favorable for the occurrence of tumescence. When this is not the case we may reasonably suspect the presence of some degree of perversion.

In the oft-quoted case of the Austrian peasant who found that he was aided in seducing young women by dancing with them and then wiping their faces with a handkerchief he had kept in his armpit, we may doubtless regard the preliminary excitement of the dance as an essential factor in the influence produced.

In the same way, I am acquainted with the ease of a lady not usually sensitive to simple body odors (though affected by perfumes and flowers) who on one occasion, when already in a state of sexual erethism, was highly excited when perceiving the odor of her lover's axilla.

The same influence of preliminary excitement may be seen in another instance known to me, that of a gentlemen who when traveling abroad fell in with three charming young ladies during a long railway journey. He was conscious of a pleasurable excitement caused by the prolonged intimacy of the journey, but this only became definitely sexual when the youngest of the ladies, stretching before him to look out of the window and holding on to the rack above, accidentally brought her axilla into close proximity with his face, whereupon erection was caused, although he himself regards personal odors, at all events when emanating from strangers, as indifferent or repulsive.

A medical correspondent, referring to the fact that with many men (indeed women also) sexual excitement occurs after dancing for a considerable time, remarks that he considers the odor of the woman's sweat is here a considerable factor.

The characteristics of olfaction which our investigation has so far revealed have not, on the whole, been favorable to the influence of personal odors as a sexual attraction in civilized men. It is a primitive sense which had its flowering time before men arose; it is a comparatively unæsthetic sense; it is a somewhat obtuse sense which among Europeans is usually incapable of perceiving the odor of the "human flower"--to use Goethe's phrase--except on very close contact, and on this account, and on account of the fact that it is a predominantly emotional sense, personal odors in ordinary social intercourse are less likely to arouse the sexual instinct than the antisexual instinct. If a certain degree of tumescence is required before a personal odor can exert an attractive influence, a powerful personal odor, strong enough to be perceived before any degree of tumescence is attained, will tend to cause repulsion, and in so doing tend, consciously or unconsciously, to excite prejudice against personal odor altogether. This is actually the case in civilization, and most people, it would appear, view with more or less antipathy the personal odors of those persons to whom they are not sexually attracted, while their attitude is neutral in this respect toward the individuals to whom they are sexually attracted.[51] The following statement by a correspondent seems to me to express the experience of the majority of men in this respect: "I do not notice that different people have different smells. Certain women I have known have been in the habit of using particular scents, but no associations could be aroused if I were to smell the same scent now, for I should not identify it. As a boy I was very fond of scent, and I associate this with my marked sexual proclivities. I like

a woman to use a little scent. It rouses my sexual feelings, but not to any large extent. I dislike the smell of a woman's vagina." While the last statement seems to express the feeling of many if not most men, it may be proper to add that there seems no natural reason why the vulvar odor of a clean and healthy woman should be other than agreeable to a normal man who is her lover.

In literature it is the natural odor of women rather than men which receives attention. We should expect this to be the case since literature is chiefly produced by men. The question as to whether men or women are really more apt to be sexually influenced in this way cannot thus be decided. Among animals, it seems probable, both sexes are alike influenced by odors, for, while it is usually the male whose sexual regions are furnished with special scent glands, when such occur, the peculiar odor of the female during the sexual season is certainly not less efficacious as an allurement to the male. If we compare the general susceptibility of men and women to agreeable odors, apart from the question of sexual allurement, there can be little doubt that it is most marked among women. As Groos points out, even among children little girls are more interested in scents than boys, and the investigations of various workers, especially Garbini, have shown that there is actually a greater power of discriminating odors among girls than among boys. Marro has gone further, and in an extended series of observations on girls before and after the establishment of puberty--which is of considerable interest from the point of view of the sexual significance of olfaction--he has shown reason to believe that girls acquire an increased susceptibility to odors when sexual life begins, although they show no such increased powers as regards the other senses.[52] On the whole, it would appear that, while women are not apt to be seriously affected, in the absence of any preliminary excitation, by crude body odors, they are by no means insusceptible to the sexual influence of olfactory impressions. It is probable, indeed, that they are more affected, and more frequently affected, in this way, than are men.

Edouard de Goncourt, in his novel *Chérie*--the intimate history of a young girl, founded, he states, on much personal observation--describes (Chapter LXXXV) the delight with which sensuous, but chaste young girls often take in strong perfumes. "Perfume and love," he remarks, "impart delights which are closely allied." In an earlier chapter (XLIV) he writes of his heroine at the age of 15: "The intimately happy emotion which the young girl experienced in reading *Paul et Virginie* and other

honestly amorous books she sought to make more complete and intense and penetrating by soaking the book with scent, and the love-story reached her senses and imagination through pages moist with liquid perfume."

Carbini (Archivio per l'Antropologia, 1896, fasc. 3) in a very thorough investigation of a large number of children, found that the earliest osmo-gustative sensations occurred in the fourth week in girls, the fifth week in boys; the first real and definite olfactory sensations appeared in the fifteenth month in girls, in the sixteenth in boys; while experiments on several hundred children between the ages of 3 and 6 years showed the girls slightly, but distinctly, superior to the boys. It may, of course, be argued that these results merely show a somewhat greater precocity of girls. I have summarized the main investigations into this question in Man and Woman, revised and enlarged edition, 1904, pp. 134-138. On the whole, they seem to indicate greater olfactory acuteness on the part of women, but the evidence is by no means altogether concordant in this sense. Popular and general scientific opinion is also by no means always in harmony. Thus, Tardif, in his book on odors in relation to the sexual instinct, throughout assumes, as a matter of course, that the sense of smell is most keen in men; while, on the other hand, I note that in a pamphlet by Mr. Martin Perls, a manufacturing perfumer, it is stated with equal confidence that "it is a well-known fact that ladies have, even without a practice of long standing, a keener sense of smell than men," and on this account he employs a staff of young ladies for testing perfumes by smell in the laboratory by the glazed paper test.

It is sometimes said that the use of strong perfumes by women indicates a dulled olfactory organ. On the other hand, it is said that the use of tobacco deadens the sensitiveness of the masculine nose. Both these statements seem to be without foundation. The use of a large amount of perfume is rather a question of taste than a question of sensory acuteness (not to mention that those who live in an atmosphere of perfume are, of course, only faintly conscious of it), and the chemist perfumer in his laboratory surrounded by strong odors can distinguish them all with great delicacy. As regards tobacco, in Spain the cigarreras are women and girls who live perpetually in an atmosphere of tobacco, and Señora Pardo Bazan, who knows them

well, remarks in her novel, La Tribuna, which deals with life in a tobacco factory, that "the acuity of the sense of smell of the cigarreras is notable, and it would seem that instead of blunting the nasal membrane the tobacco makes the olfactory nerves keener."

"It was the same as if I was in a sweet apple garden, from the sweetness that came to me when the light wind passed over them and stirred their clothes," a woman is represented as saying concerning a troop of handsome men in the Irish sagas (Cuchulain of Muirthemne, p. 161). The pleasure and excitement experienced by a woman in the odor of her lover is usually felt concerning a vague and mixed odor which may be characteristic, but is not definitely traceable to any specific bodily sexual odor. The general odor of the man she loves, one woman states, is highly, sometimes even overwhelmingly, attractive to her; but the specific odor of the male sexual organs which she describes as fishy has no attraction. A man writes that in his relations with women he has never been able to detect that they were influenced by the axillary or other specific odors. A woman writes: "To me any personal odor, as that of perspiration, is very disagreeable, and the healthy naked human body is very free from any odor. Fresh perspiration has no disagreeable smell; it is only by retention in the clothing that it becomes objectionable. The faint smell of smoke which lingers round men who smoke much is rather exciting to me, but only when it is very faint. If at all strong it becomes disagreeable. As most of the men who have attracted me have been great smokers, there is doubtless a direct association of ideas. It has only once occurred to me that an indifferent unpleasant smell became attractive in connection with some particular person. In this case it was the scent of stale tobacco, such as comes from the end of a cold cigar or cigarette. It was, and is now, very disagreeable to me, but, for the time and in connection with a particular person, it seemed to me more delightful and exciting than the most delicious perfume. I think, however, only a very strong attraction could overcome a dislike of this sort, and I doubt if I could experience such a twist-round if it had been a personal odor. Stale tobacco, though nasty, conveys no mentally disagreeable idea. I mean it does not suggest dirt or unhealthiness."

It is probably significant of the somewhat considerable part

which, in one way or another, odors and perfumes play in the emotional life of women, that, of the 4 women whose sexual histories are recorded in Appendix B of vol. iii of these _Studies_, all are liable to experience sexual effects from olfactory stimuli, 3 of them from personal odors (though this fact is not in every case brought out in the histories as recorded), while of the 8 men not one has considered his olfactory experiences in this respect as worthy of mention.

The very marked sexual fascination which odor, associated with the men they love, exerts on women has easily passed unperceived, since women have not felt called upon to proclaim it. In sexual inversion, however, when the woman takes a more active and outspoken part than in normal love, it may very clearly be traced. Here, indeed, it is often exaggerated, in consequence of the common tendency for neurotic and neurasthenic persons to be more than normally susceptible to the influence of odors. In the majority of inverted women, it may safely be said, the odor of the beloved person plays a very considerable part. Thus, one inverted woman asks the woman she loves to send her some of her hair that she may intoxicate herself in solitude with its perfume (_Archivio di Psicopatie Sessuali_, vol. i, fasc. 3, p. 36). Again, a young girl with some homosexual tendencies, was apt to experience sexual emotions when in ordinary contact with schoolfellows whose body odor was marked (Féré, _L'Instinct Sexuel_, p. 260). Such examples are fairly typical.

That the body odor of men may in a large number of cases be highly agreeable and sexually attractive is shown by the testimony of male sexual inverts. There is abundant evidence to this effect. Raffalovich (_L'Uranisme et l'Unisexualité_, p. 126) insists on the importance of body odors as a sexual attraction to the male invert, and is inclined to think that the increased odor of the man's own body during sexual excitement may have an auto-aphrodisiacal effect which is reflected on the body of the loved person. The odor of peasants, of men who work in the open air, is specially apt to be found attractive. Moll mentions the case of an inverted man who found the "forest, mosslike odor" of a schoolfellow irresistibly attractive.

The following passage from a letter written by an Italian marquis has been sent to me: "Bonifazio stripped one evening, to give me

pleasure. He has the full, rounded flesh and amber coloring which painters of the Giorgione school gave to their S. Sebastians. When he began to dress, I took up an old _fascia_, or girdle of netted silk, which was lying under his breeches, and which still preserved the warmth of his body. I buried my face in it, and was half inebriated by its exquisite aroma of young manhood and fresh hay. He told me he had worn it for two years. No wonder it was redolent of him. I asked him to let me keep it as a souvenir. He smiled and said: 'You like it because it has lain so long upon my _panoia_.' 'Yes, just so,' I replied; 'whenever I kiss it, thus and thus, it will bring you back to me.' Sometimes I tie it round my naked waist before I go to bed. The smell of it is enough to cause a powerful erection, and the contact of its fringes with my testicles and phallus has once or twice produced an involuntary emission."

I may here reproduce a communication which has reached me concerning the attractiveness of the odor of peasants: "One predominant attraction of these men is that they are pure and clean; their bodies in a state of healthy normal function. Then they possess, if they are temperate, what the Greek poet Straton called the *phydikê chrôtos* (a quality which, according to this authority, is never found in women). This 'natural fair perfume of the flesh' is a peculiar attribute of young men who live in the open air and deal with natural objects. Even their perspiration has an odor very different from that of girls in ball-rooms: more refined, ethereal, pervasive, delicate, and difficult to seize. When they have handled hay--in the time of hay-harvest, or in winter, when they bring hay down from mountain huts--the youthful peasants carry about with them the smell of 'a field the Lord hath blessed.' Their bodies and their clothes exhale an indefinable fragrance of purity and sex combined. Every gland of the robust frame seems to have accumulated scent from herbs and grasses, which slowly exudes from the cool, fresh skin of the lad. You do not perceive it in a room. You must take the young man's hands and bury your face in them, or be covered with him under the same blanket in one bed, to feel this aroma. No sensual impression on the nerves of smell is more poignantly impregnated with spiritual poetry--the poetry of adolescence, and early hours upon the hills, and labor cheerfully accomplished, and the harvest of God's gifts to man brought home by human industry. It is worth mentioning that Aristophanes, in his

description of the perfect Athenian Ephebus, dwells upon his being redolent of natural perfumes."

In a passage in the second part of *Faust* Goethe (who appears to have felt considerable interest in the psychology of smell) makes three women speak concerning the ambrosiacal odor of young men.

In this connection, also, I note a passage in a poem ("Appleton House") by our own English poet Marvell, which it is of interest to quote:--

"And now the careless victors play,
Dancing the triumphs of the hay,
When every mower's wholesome heat
Smells like an Alexander's sweat.
Their females fragrant as the mead
Which they in fairy circles tread,
When at their dance's end they kiss,
Their new-mown hay not sweeter is."

FOOTNOTES:

[30] R. Andree, "Völkergeruch," in *Ethnographische Parallelen*, Neue Folge, 1889, pp. 213-222, brings together many passages describing the odors of various peoples. Hagen, *Sexuelle Osphrésiologie*, pp. 166 et seq., has a chapter on the subject; Joest, supplement to *International Archiv für Ethnographie*, 1893, p. 53, has an interesting passage on the smells of various races, as also Waitz, *Introduction to Anthropology*, p. 103. Cf. Sir H.H. Johnston, *British Central Africa*, p. 395; T.H. Parke, *Experiences in Equatorial Africa*, p. 409; E.H. Man, *Journal of the Anthropological Institute*, 1889, p. 391; Brough Smyth, *Aborigines of Victoria*, vol. i, p. 7; d'Orbigny, *L'Homme Américain*, vol. i, p. 87, etc.

[31] B. Adachi "Geruch der Europaer," *Globus*, 1903, No. 1.

[32] Hagen quotes testimonies on this point, *Sexuelle Osphrésiologie*, p. 173. The negro, Castellani states, considers that Europeans have a smell of death.

[45] Toulouse, *_Emile Zola_*, pp. 163-165, 173-175.

[46] P.J. Möbius, *_Das Pathologische bei Nietzsche_*.

[47] Moll has a passage on the sense of smell in the blind, more especially in sexual respects, *_Untersuchungen über die Libido Sexualis_*, bd. 1, pp. 137 et seq.

[48] See, for instance, his poem, "Love Perfumes all Parts," in which he declares that "Hands and thighs and legs are all richly aromatic." And compare the lyrics entitled "A Song to the Maskers," "On Julia's Breath," "Upon Julia's Unlacing Herself," "Upon Julia's Sweat," and "To Mistress Anne Soame."

[49] There are various indications that Goethe was attentive to the attraction of personal odors; and that he experienced this attraction himself is shown by the fact that, as he confessed, when he once had to leave Weimar on an official journey for two days he took a bodice of Frau von Stein's away in order to carry the scent of her body with him.

[50] Hagen has brought together from the literature of the subject a number of typical cases of olfactory fetichism, *_Sexuelle Osphrésologie_*, 1901, pp. 82 et seq.

[51] Moll's inquiries among normal persons have also shown that few people are conscious of odor as a sexual attraction. (*_Untersuchungen über die Libido Sexualis_*. Bd. I, p. 133.)

[52] Marro, *_La, Pubertà_*, 1898, Chapter II. Tardif found in boys that perfumes exerted little or no influence on circulation and respiration before puberty, though his observations on this point were too few to carry weight.

IV.

The Influence of Perfumes--Their Aboriginal Relationship to Sexual Body Odors--This True even of the Fragrance of Flowers--The Synthetic Manufacture of Perfumes--The Sexual Effects of Perfumes--Perfumes perhaps Originally Used to Heighten the Body Odors--The Special Significance of the Musk Odor--Its Wide Natural Diffusion in Plants and Animals and Man--Musk a Powerful Stimulant--Its Widespread Use as a Perfume--*Peau d'Espagne*--The Smell of Leather and its Occasional Sexual Effects--The Sexual Influence of the Odors of Flowers--The Identity of many Plant Odors with Certain Normal and Abnormal Body Odors--The Smell of Semen in this Connection.

So far we have been mainly concerned with purely personal odors. It is, however, no longer possible to confine the discussion of the sexual significance of odor within the purely animal limit. The various characteristics of personal odor which have been noted--alike those which tend to make it repulsive and those which tend to make it attractive--have led to the use of artificial perfumes, to heighten the natural odor when it is regarded as attractive, to disguise it when it is regarded as repellent; while at the same time, happily covering both of these impulses, has developed the pure delight in perfume for its own agreeableness, the æsthetic side of olfaction. In this way--although in a much less constant and less elaborate manner--the body became adorned to the sense of smell just as by clothing and ornament it is adorned to the sense of sight.

But--and this is a point of great significance from our present standpoint--we do not really leave the sexual sphere by introducing artificial perfumes. The perfumes which we extract from natural products, or, as is now frequently the case, produce by chemical synthesis, are themselves either actually animal sexual odors or allied in character or composition, to the personal odors they are used to heighten or disguise. Musk is the product of glands of the male *Moschus moschiferus* which correspond to preputial sebaceous glands; castoreum is the product of similar sexual glands in the beaver, and civet likewise from the civet; ambergris is an intestinal calculus found in the rectum of the cachelot.[53] Not only, however, are nearly all the perfumes of animal origin, in use by civilized man, odors which have a specially sexual object among the animals from which they are derived, but even the perfumes of flowers may be said to be of sexual character. They are given out at the reproductive period in the lives of plants, and they clearly have very largely as their object an appeal to the insects who secure plant fertilization, such appeal having as its basis the fact that among insects themselves olfactory sensibility has in many cases been developed in their own mating.[54] There is, for example, a moth in which both sexes are similarly and inconspicuously marked, but the males diffuse an agreeable odor, said to be like pineapple, which attracts the females.[55] If, therefore, the odors of flowers have developed because they proved useful to the plant by attracting insects or other living creatures, it is obvious that the advantage would lie with those plants which could put forth an animal sexual odor of agreeable character, since such an odor would prove fascinating to animal creatures. We here have a very simple explanation of the fundamental identity of odors in the animal and vegetable worlds. It thus comes about that from a psychological point of

view we are not really entering a new field when we begin to discuss the influence of perfumes other than those of the animal body. We are merely concerned with somewhat more complex or somewhat more refined sexual odors; they are not specifically different from the human odors and they mingle with them harmoniously. Popular language bears witness to the truth of this statement, and the normal and abnormal human odors, as we have already seen, are constantly compared to artificial, animal, and plant odors, to chloroform, to musk, to violet, to mention only those similitudes which seem to occur most frequently.

The methods now employed for obtaining the perfumes universally used in civilized lands are three: (1) the extraction of odoriferous compounds from the neutral products in which they occur; (2) the artificial preparation of naturally occurring odoriferous compounds by synthetic processes; (3) the manufacture of materials which yield odors resembling those of pleasant smelling natural objects. (See, e.g., "Natural and Artificial Perfumes," *Nature*, December 27, 1900.) The essential principles of most of our perfumes belong to the complex class of organic compounds known as terpenes. During recent years a number of the essential elements of natural perfumes have been studied, in many cases the methods of preparing them artificially discovered, and they are largely replacing the use of natural perfumes not only for soaps, etc., but for scent essences, though it appears to be very difficult to imitate exactly the delicate fragrance achieved by Nature. Artificial musk was discovered accidentally by Bauer when studying the butyltoluenes contained in a resin extractive. Vanillin, the odoriferous principle of the vanilla bean, is an aldehyde which was first artificially prepared by Tiemann and Haarmann in 1874 by oxidizing coniferin, a glucoside contained in the sap of various coniferæ, but it now appears to be usually manufactured from eugenol, a phenol contained in oil of cloves. Piperonal, an aldehyde closely allied to vanillin, is used in perfumery under the name of heliotropin and is prepared from oil of sassafras and oil of camphor. Cumarine, the material to which tonka bean, sweet woodruff, and new-mown hay owe their characteristic odors, was synthetically prepared by W.H. Parkin in 1868 by heating sodiosalicylic aldehyde with acetic anhydride, though now more cheaply prepared from an herb growing in Florida. Irone, which has the perfume of violets, was isolated in 1893 from a ketone contained in orris-root; and ionone, another ketone which has a very closely similar odor of fresh violets and was

isolated after some years' further work, is largely used in the preparation of violet perfume. Irone and ionone are closely similar in composition to oil of turpentine which when taken into the body is partly converted into perfume and gives a strong odor of violets to the urine. "Little has yet been accomplished toward ascertaining the relation between the odor and the chemical constitution of substances in general. Hydrocarbons as a class possess considerable similarity in odor, so also do the organic sulphides and, to a much smaller extent, the ketones. The subject waits for some one to correlate its various physiological, psychological and physical aspects in the same way that Helmholtz did for sound. It seems, as yet, impossible to assign any probable reason to the fact that many substances have a pleasant odor. It may, however, be worth suggesting that certain compounds, such as the volatile sulphides and the indoles, have very unpleasant odors because they are normal constituents of mammalian excreta and of putrefied animal products; the repulsive odors may be simply necessary results of evolutionary processes." (_Loc. cit._, _Nature_, December 27, 1900.)

Many of the perfumes in use are really combinations of a great many different odors in varying proportions, such as oil of rose, lavender oil, ylang-ylang, etc. The most highly appreciated perfumes are often made up of elements which in stronger proportion would be regarded as highly unpleasant.

In the study and manufacture of perfumes Germany and France have taken the lead in recent times. The industry is one of great importance. In France alone the trade in perfumes amounts to £4,000,000.

It is doubtless largely owing to the essential and fundamental identity of odors--to the chemical resemblances even of odors from the most widely remote sources--that we find that perfumes in many cases have the same sexual effects as are primitively possessed by the body odors. In northern countries, where the use of perfumes is chiefly cultivated by women, it is by women that this sexual influence is most liable to be felt. In the South and in the East it appears to be at least equally often experienced by men. Thus, in Italy Mantegazza remarks that "many men of strong sexual temperament cannot visit with impunity a laboratory of essences and perfumes." [56] In the East we find it stated in the Islamic book entitled

The Perfumed Garden of Sheik Nefzaoui that the use of perfumes by women, as well as by men, excites to the generative act. It is largely in reliance on this fact that in many parts of the world, especially among Eastern peoples and occasionally among ourselves in Europe, women have been accustomed to perfume the body and especially the vulva.[57]

It seems highly probable that, as has been especially emphasized by Hagen, perfumes were primitively used by women, not as is sometimes the case in civilization, with the idea of disguising any possible natural odor, but with the object of heightening and fortifying the natural odor.[58] If the primitive man was inclined to disparage a woman whose odor was slight or imperceptible,--turning away from her with contempt, as the Polynesian turned away from the ladies of Sydney: "They have no smell!"--women would inevitably seek to supplement any natural defects in this respect, and to accentuate their odorous qualities, in the same way as by corsets and bustles, even in civilization, they have sought to accentuate the sexual salencies of their bodies. In this way we may, as Hagen suggests, explain the fact that until recent times the odors preferred by women have not been the most delicate or exquisite, but the strongest, the most animal, the most sexual: musk, castoreum, civet, and ambergris.

In that interesting novel--dealing with the adventures of a Jewish maiden at the Persian court of Xerxes--which under the title of Esther has found its way into the Old Testament we are told that it was customary in the royal harem at Shushan to submit the women to a very prolonged course of perfuming before they were admitted to the king: "six months with oil of myrrh and six months with sweet odors." (Esther, Chapter II, v. 12.)

In the Arabian Nights there are many allusions to the use of perfumes by women with a more or less definitely stated aphrodisiacal intent. Thus we read in the story of Kamaralzaman: "With fine incense I will perfume my breasts, my belly, my whole body, so that my skin may melt more sweetly in thy mouth, O apple of my eye!"

Even among savages the perfuming of the body is sometimes practiced with the object of inducing love in the partner. Schellong states that the Papuans of Kaiser Wilhelm's Land rub various fragrant plants into their bodies for this purpose. (Zeitschrift für Ethnologie, 1899, ht. i, p. 19.) The significance of this practice is more fully revealed by Haddon

when studying the Papuans of Torres Straits among whom the initiative in courtship is taken by the women. It was by scenting himself with a pungent odorous substance that a young man indicated that he was ready to be sued by the girls. A man would wear this scent at the back of his neck during a dance in order to attract the attention of a particular girl; it was believed to act with magical certainty, after the manner of a charm (_Reports of the Cambridge Anthropological Expedition to Torres Straits_, vol. v, pp. 211, 222, and 328).

The perfume which is of all perfumes the most interesting from the present point of view is certainly musk. With ambergris, musk is the chief member of Linnæus's group of _Odores ambrosiacæ_, a group which in sexual significances, as Zwaardemaker remarks, ranks besides the capryl group of odors. It is a perfume of ancient origin; its name is Persian[59] (indicating doubtless the channel whence it reached Europe) and ultimately derived from the Sanskrit word for testicle in allusion to the fact that it was contained in a pouch removed from the sexual parts of the male musk-deer. Musk odors, however, often of considerable strength, are very widely distributed in Nature, alike among animals and plants. This is indicated by the frequency with which the word "musk" forms part of the names of animals and plants which are by no means always nearly related. We have the musk-ox, the musky mole, several species called musk-rat, the musk-duct, the musk-beetle; while among plants which have received their names from a real or supposed musky odor are, besides several that are called musk-plant, the musk-rose, the musk-hyacinth, the musk-mallow, the musk-orchid, the musk-melon, the musk-cherry, the musk-pear, the musk-plum, muskat and muscatels, musk-seed, musk-tree, musk-wood, etc.[60] But a musky odor is not merely widespread in Nature among plants and the lower animals, it is peculiarly associated with man. Incidentally we have already seen how it is regarded as characteristic of some races of man, especially the Chinese. Moreover, the smell of the negress is said to be musky in character, and among Europeans a musky odor is said to be characteristic of blondes. Laycock, in his _Nervous Diseases of Women_, stated his opinion that "the musk odor is certainly the sexual odor of man"; and Féré states that the musk odor is that among natural perfumes most nearly approaching the odor of the sexual secretions. We have seen that the Chinese poet vaunts the musky odor of his mistress's armpits, while another Oriental saying concerning the attractive woman is that "her navel is filled with musk." Persian literature contains many references to musk as an attractive body odor, and Firdusi speaks of a woman's hair as "a crown of musk," while the Arabian poet Motannabi says of his mistress

that "her hyacinthine hair smells sweeter than Scythian musk." Galopin stated that he knew women whose natural odor of musk (and less frequently of ambergris) was sufficiently strong to impart to a bath in less than an hour a perfume due entirely to the exhalations of the musky body; it must be added that Galopin was an enthusiast in this matter.

The special significance of musk from our present point of view lies not only in the fact that we here have a perfume, widely scattered throughout nature and often in an agreeable form, which is at the same time a very frequent personal odor in man. Musk is the odor which not only in the animals to which it has given a name, but in many others, is a specifically sexual odor, chiefly emitted during the sexual season. The sexual odors, indeed, of most animals seem to be modifications of musk. The Sphinx moth has a musky odor which is confined to the male and is doubtless sexual. Some lizards have a musky odor which is heightened at the sexual season; crocodiles during the pairing season emit from their submaxillary glands a musky odor which pervades their haunts. In the same way elephants emit a musky odor from their facial glands during the rutting season. The odor of the musk-duck is chiefly confined to the breeding season.[61] The musky odor of the negress is said to be heightened during sexual excitement.

The predominance of musk as a sexual odor is associated with the fact that its actual nervous influence, apart from the presence of sexual association, is very considerable. Féré found it to be a powerful muscular stimulant. In former times musk enjoyed a high reputation as a cardiac stimulant; it fell into disuse, but in recent years its use in asthenic states has been revived, and excellent results, it has been claimed, have followed its administration in cases of collapse from Asiatic cholera. For sexual torpor in women it still has (like vanilla and sandal) a certain degree of reputation, though it is not often used, and some of the old Arabian physicians (especially Avicenna) recommended it, with castoreum and myrrh, for amenorrhoea. Its powerful action is indicated by the experience of Esquirol, who stated that he had seen cases in which sensory stimulation by musk in women during lactation had produced mania. It has always had the reputation, more especially in the Mohammedan East, of being a sexual stimulant to men; "the noblest of perfumes," it is called in *_El Ktab_*, "and that which most provokes to venery."

It is doubtless a fact significant of the special sexual effects of musk that, as Laycock remarked, in cases of special idiosyncrasy to odors, musk appears to be that odor which is most liked or disliked. Thus, the old

English physician Whytt remarked that "several delicate women who could easily bear the stronger smell of tobacco have been thrown into fits by musk, ambergris, or a pale rose." [62] It may be remarked that in the Perfumed Garden of Sheik Nefzaoui it is stated that it is by their sexual effects that perfumes tend to throw women into a kind of swoon, and Lucretius remarks that a woman who smells castoreum, another animal sexual perfume, at the time of her menstrual period may swoon. [63]

Not only is musk the most cherished perfume of the Islamic world, and the special favorite of the Prophet himself, who greatly delighted in perfumes ("I love your world," he is reported to have said in old age, "for its women and its perfumes"), [64] it is the only perfume generally used by the women of a land in which the refinements of life have been carried so far as Japan, and they received it from the Chinese. [65]

Moreover, musk is still the most popular of European perfumes. It is the perfumes containing musk, Piesse states in his well-known book on the Art of Perfumery, which sell best. It is certainly true that in its simple form the odor of musk is not nowadays highly considered in Europe. This fact is connected with the ever-growing refinement in accordance with which the specific odors of the sexual regions in human beings tend to lose their primitive attractiveness and bodily odors generally become mingled with artificial perfumes and so disguised. But, although musk in its simple form, and under its ancient name, has lost its hold in Europe, it is an interesting and significant fact that it is still the perfumes which contain musk that are the most widely popular.

Peau d'Espagne may be mentioned as a highly complex and luxurious perfume, often the favorite scent of sensuous persons, which really owes a large part of its potency to the presence of the crude animal sexual odors of musk and civet. It consists of wash-leather steeped in ottos of neroli, rose, santal, lavender, verbena, bergamot, cloves, and cinnamon, subsequently smeared with civet and musk. It is said by some, probably with a certain degree of truth, that Peau d'Espagne is of all perfumes that which most nearly approaches the odor of a woman's skin; whether it also suggests the odor of leather is not so clear.

There is, however, no doubt that the smell of leather has a curiously stimulating sexual influence on many men and women. It is an odor which seems to occupy an intermediate place between the natural body odors and the artificial perfumes for which it sometimes serves as a basis; possibly it is to this fact that its occasional sexual influence is owing, for, as

we have already seen, there is a tendency for sexual allurements to attach to odors which are not the specific personal body odors but yet are related to them. Moll considers, no doubt rightly, that shoe fetichism, perhaps the most frequent of sexual fetichistic perversions, is greatly favored, if, indeed, it does not owe its origin to, the associated odor of the feet and of the shoes.[66] He narrates a case of shoe fetichism in a man in which the perversion began at the age of 6; when for the first time he wore new shoes, having previously used only the left-off shoes of his elder brother; he felt and smelt these new shoes with sensations of unmeasured pleasure; and a few years later began to use shoes as a method of masturbation.[67] Näcke has also recorded the case of a shoe fetichist who declared that the sexual attraction of shoes (usually his wife's) lay largely in the odor of the leather.[68] Krafft-Ebing, again, brings forward a case of shoe fetichism in which the significant fact is mentioned that the subject bought a pair of leather cuffs to smell while masturbating.[69] Restif de la Bretonne, who was somewhat of a shoe fetichist, appears to have enjoyed smelling shoes. It is not probable that the odor of leather explains the whole of shoe fetichism,--as we shall see when, in another "Study," this question comes before us--and in many cases it cannot be said to enter at all; it is, however, one of the factors. Such a conclusion is further supported by the fact that by many the odor of new shoes is sometimes desired as an adjuvant to coitus. It is in the experience of prostitutes that such a device is not infrequent. Näcke mentions that a colleague of his was informed by a prostitute that several of her clients desired the odor of new shoes in the room, and that she was accustomed to obtain the desired perfume by holding her shoes for a moment over the flame of a spirit lamp.

The direct sexual influence of the odor of leather is, however, more conclusively proved by those instances in which it exists apart from shoes or other objects having any connection with the human body. I have elsewhere in these "Studies"[71] recorded the case of a lady, entirely normal in sexual and other respects, who is conscious of a considerable degree of pleasurable sexual excitement in the presence of the smell of leather objects, more especially of leather-bound ledgers and in shops where leather objects are sold. She thinks this dates from the period when, as a child of 9, she was sometimes left alone for a time on a high stool in an office. A possible explanation in this case lies in the supposition that on one of these early occasions sexual excitement was produced by the contact with the stool (in a way that is not infrequent in young girls) and that the accidentally associated odor of leather permanently affected the nervous system, while the really significant

contact left no permanent impression. Even on such a supposition it might, however, still be maintained that a real potency of the leather odor is illustrated by this case, and this is likewise suggested by the fact that the same subject is also sexually affected by various perfumes and odorous flowers not recalling leather.[70]

It has been suggested to me by a lady that the odor of leather suggests that of the sexual organs. The same suggestion is made by Hagen,[72] and I find it stated by Gould and Pyle that menstruating girls sometimes smell of leather. The secret of its influence may thus be not altogether obscure; in the fact that leather is animal skin, and that it may thus vaguely stir the olfactory sensibilities which had been ancestrally affected by the sexual stimulus of the skin odor lies the probable foundation of the mystery.

In the absence of all suggestion of personal or animal odors, in its most exquisite forms in the fragrance of flowers, olfactory sensations are still very frequently of a voluptuous character. Mantegazza has remarked that it is a proof of the close connection between the sense of smell and the sexual organs that the expression of pleasure produced by olfaction resembles the expression of sexual pleasures.[73] Make the chastest woman smell the flowers she likes best, he remarks, and she will close her eyes, breathe deeply, and, if very sensitive, tremble all over, presenting an intimate picture which otherwise she never shows, except perhaps to her lover. He mentions a lady who said: "I sometimes feel such pleasure in smelling flowers that I seem to be committing a sin." [74] It is really the case that in many persons--usually, if not exclusively, women--the odor of flowers produces not only a highly pleasurable, but a distinctly and specifically sexual, effect. I have met with numerous cases in which this effect was well marked. It is usually white flowers with heavy, penetrating odors which exert this influence. Thus, one lady (who is similarly affected by various perfumes, forget-me-nots, ylang-ylang, etc.) finds that a number of flowers produce on her a definite sexual effect, with moistening of the pudenda. This effect is especially produced by white flowers like the gardenia, tuberose, etc. Another lady, who lives in India, has a similar experience with flowers. She writes: A scent to cause me sexual excitement must be somewhat heavy and penetrating. Nearly all white flowers so affect me and many Indian flowers with heavy, almost pungent scents. (All the flower scents are quite unconnected with me with any individual.) Tuberose, lilies of the valley, and frangipani flowers have an almost intoxicating effect on me. Violets, roses, mignonette, and many others, though very delicious, give me no sexual

feeling at all. For this reason the line, 'The lilies and languors of virtue for the roses and raptures of vice' seems all wrong to me. The lily seems to me a very sensual flower, while the rose and its scent seem very good and countrified and virtuous. Shelley's description of the lily of the valley, 'whom youth makes so fair and passion so pale,' falls in much more with my ideas. "I can quite understand," she adds, "that leather, especially of books, might have an exciting effect, as the smell has this penetrating quality, but I do not think it produces any special feeling in me." This more sensuous character of white flowers is fairly obvious to many persons who do not experience from them any specifically sexual effects. To some people lilies have an odor which they describe as sexual, although these persons may be quite unaware that Hindu authors long since described the vulvar secretion of the Padmini, or perfect woman, during coitus, as "perfumed like the lily that has newly burst." [75] It is noteworthy that it was more especially the white flowers--lily, tuberose, etc.--which were long ago noted by Cloquet as liable to cause various unpleasant nervous effects, cardiac oppression and syncope. [76]

When we are concerned with the fragrances of flowers it would seem that we are far removed from the human sexual field, and that their sexual effects are inexplicable. It is not so. The animal and vegetable odors, as, indeed, we have already seen, are very closely connected. The recorded cases are very numerous in which human persons have exhaled from their skins--sometimes in a very pronounced degree--the odors of plants and flowers, of violets, of roses, of pineapple, of vanilla. On the other hand, there are various plant odors which distinctly recall, not merely the general odor of the human body, but even the specifically sexual odors. A rare garden weed, the stinking goosefoot, Chenopodium vulvaria, it is well known, possesses a herring brine or putrid fish odor--due, it appears, to propylamin, which is also found in the flowers of the common white thorn or mayflower (Cratægus oxyacantha) and many others of the Rosaceæ--which recalls the odor of the animal and human sexual regions. [77] The reason is that both plant and animal odors belong chemically to the same group of capryl odors (Linnæus's Odores hircini), so called from the goat, the most important group of odors from the sexual point of view. Caproic and capryl acid are contained not only in the odor of the goat and in human sweat, and in animal products as many cheeses, but also in various plants, such as Herb Robert (Geranium robertianum), and the Stinking St. John's worts (Hypericum hircinum), as well as the Chenopodium. Zwaardemaker considers it probable that the odor of the vagina belongs to the same group, as well as the odor of semen (which

Haller called *_odor aphrodisiacus_*), which last odor is also found, as Cloquet pointed out, in the flowers of the common berberry (*_Berberis vulgaris_*) and in the chestnut. A very remarkable and significant example of the same odor seems to occur in the case of the flowers of the henna plant, the white-flowered *Lawsonia* (*_Lawsonia inermis_*), so widely used in some Mohammedan lands for dyeing the nails and other parts of the body. "These flowers diffuse the sweetest odor," wrote Sonnini in Egypt a century ago; "the women delight to wear them, to adorn their houses with them, to carry them to the baths, to hold them in their hands, and to perfume their bosoms with them. They cannot patiently endure that Christian and Jewish women shall share the privilege with them. It is very remarkable that the perfume of the henna flowers, when closely inhaled, is almost entirely lost in a very decided spermatic odor. If the flowers are crushed between the fingers this odor prevails, and is, indeed, the only one perceptible. It is not surprising that so delicious a flower has furnished Oriental poetry with many charming traits and amorous similes." Such a simile Sonnini finds in the *_Song of Songs_*, i. 13-14.[78]

The odor of semen has not been investigated, but, according to Zwaardemaker, artificially produced odors (like cadaverin) resemble it. The odor of the leguminous fenugreek, a botanical friend considers, closely approaches the odor given off in some cases by the armpit in women. It is noteworthy that fenugreek contains cumarine, which imparts its fragrance to new-mown hay and to various flowers of somewhat similar odor. On some persons these have a sexually exciting effect, and it is of considerable interest to observe that they recall to many the odor of semen. "It seems very natural," a lady writes, "that flowers, etc., should have an exciting effect, as the original and by far the pleasantest way of love-making was in the open among flowers and fields; but a more purely physical reason may, I think, be found in the exact resemblance between the scent of semen and that of the pollen of flowering grasses. The first time I became aware of this resemblance it came on me with a rush that here was the explanation of the very exciting effect of a field of flowering grasses and, perhaps through them, of the scents of other flowers. If I am right, I suppose flower scents should affect women more powerfully than men in a sexual way. I do not think anyone would be likely to notice the odor of semen in this connection unless they had been greatly struck by the exciting effects of the pollen of grasses. I had often noticed it and puzzled over it." As pollen is the male sexual element of flowers, its occasionally stimulating effect in this direction is perhaps but an accidental result of a unity running through the organic world, though it may be perhaps more simply explained as a special form of

that nasal irritation which is felt by so many persons in a hay-field. Another correspondent, this time a man, tells me that he has noted the resemblance of the odor of semen to that of crushed grasses. A scientific friend who has done much work in the field of organic chemistry tells me he associates the odor of semen with that produced by diastasic action on mixing flour and water, which he regards as sexual in character. This again brings us to the starchy products of the leguminous plants. It is evident that, subtle and obscure as many questions in the physiology and psychology of olfaction still remain, we cannot easily escape from their sexual associations.

[70] Philip Salmuth (_Observationes Medicæ_, Centuria II, no. 63) in the seventeenth century recorded a case in which a young girl of noble birth (whose sister was fond of eating chalk, cinnamon, and cloves) experienced extreme pleasure in smelling old books. It would appear, however, that in

this case the fascination lay not so much in the odor of the leather as in the mouldy odor of worm-eaten books; "_fatore veterum liborum, a blattis et tineis exesorum, situque prorsus corruptorum_" are Salmuth's words.

V.

The Evil Effects of Excessive Olfactory Stimulation--The Symptoms of Vanillism--The Occasional Dangerous Results of the Odors of Flowers--Effects of Flowers on the Voice.

The reality of the olfactory influences with which we have been concerned, however slight they may sometimes appear, is shown by the fact that odors, both agreeable and disagreeable, are stimulants, obeying the laws which hold good for stimulants generally. They whip up the nervous energies momentarily, but in the end, if the excitation is excessive and prolonged, they produce fatigue and exhaustion. This is clearly shown by Féré's elaborate experiments on the influences of odors, as compared with other sensory stimulants, on the amount of muscular work performed with the ergograph.[79] Commenting on the remark of Bernardin de Saint-Pierre, that "man uses perfumes to impart energy to his passion," Féré remarks: "But perfumes cannot keep up the fires which they light." Their prolonged use involves fatigue, which is not different from that produced by excessive work, and reproduces all the bodily and psychic accompaniments of excessive work.[80] It is well known that workers in perfumes are apt to suffer from the inhalation of the odors amid which they live. Dealers in musk are said to be specially liable to precocious dementia. The symptoms generally experienced by the men and women who work in vanilla factories where the crude fruit is prepared for commerce have often been studied and are well known. They are due to the inhalation of the scent, which has all the properties of the aromatic aldehydes, and include skin eruptions,[81] general excitement, sleeplessness, headache, excessive menstruation, and irritable bladder. There is nearly always sexual excitement, which may be very pronounced.[82]

We are here in the presence, it may be insisted, not of a nervous influence only, but of a direct effect of odor on the vital processes. The experiments of Tardif on the influence of perfumes on frogs and rabbits showed that a poisonous effect was exerted;[83] while Féré, by incubating fowls' eggs in the presence of musk, found repeatedly that many abnormalities occurred, and that development was retarded even in the embryos that remained normal; while he obtained somewhat similar results by using essences of lavender, cloves, etc.[84] The influence of odors is thus deeper than is indicated by their nervous effects; they act directly on nutrition. We are led, as Passy remarks, to regard odors as very intimately related to the physiological properties of organic substances, and the sense of smell as a detached fragment of generally sensibility, reacting to the same stimuli as general sensibility, but highly specialized in view of its protective function.

The reality and subtlety of the influence of odors is further shown, by the cases in which very intense effects are produced

even by the temporary inhalation of flowers or perfumes or other odors. Such cases of idiosyncrasy in which a person--frequently of somewhat neurotic temperament--becomes acutely sensitive to some odor or odors have been recorded in medical literature for many centuries. In these cases the obnoxious odor produces congestion of the respiratory passages, sneezing, headache, fainting, etc., but occasionally, it has been recorded, even death. (Dr. J.N. Mackenzie, in his interesting and learned paper on "The Production of the so-called 'Rose Cold,' etc.," *American Journal of Medical Sciences*, January, 1886, quotes many cases, and gives a number of references to ancient medical authors; see also Layet, art. "Odeur," *Dictionnaire Encyclopédique des Sciences Médicales*.)

An interesting phenomenon of the group--though it is almost too common to be described as an idiosyncrasy--is the tendency of the odor of certain flowers to affect the voice and sometimes even to produce complete loss of voice. The mechanism of the process is not fully understood, but it would appear that congestion and paresis of the larynx is produced and spasm of the bronchial tube. Botallus in 1565 recorded cases in which the scent of flowers brought on difficulty of breathing, and the danger of flowers from this point of view is well recognized by professional singers. Joal has studied this question in an elaborate paper (summarized in the *British Medical Journal*, March 3, 1895), and Dr. Cabanès has brought together (*Figaro*, January 20, 1894) the experiences of a number of well-known singers, teachers of singing, and laryngologists. Thus, Madame Renée Richard, of the Paris Opera, has frequently found that when her pupils have arrived with a bunch of violets fastened to the bodice or even with a violet and iris sachet beneath the corset, the voice has been marked by weakness and, on using the laryngoscope, she has found the vocal cords congested. Madame Calvé confirmed this opinion, and stated that she was specially sensitive to tuberose and mimosa, and that on one occasion a bouquet of white lilac has caused her, for a time, complete loss of voice. The flowers mentioned are equally dangerous to a number of other singers; the most injurious flower of all is found to be the violet. The rose is seldom mentioned, and artificial perfumes are comparatively harmless, though some singers consider it desirable to be cautious in using them.

FOOTNOTES:

[79] Féré, *_Travail et Plaisir_*, Chapter XIII.

[80] *_Travail et Plaisir_*, p. 175. It is doubtless true of the effects of odors on the sexual sphere. Féré records the case of a neurasthenic lady whose sexual coldness toward her husband only disappeared after the abandonment of a perfume (in which heliotrope was apparently the chief constituent) she had been accustomed to use in excessive amounts.

[81] It is perhaps significant that many colors are especially liable to produce skin disorders, especially urticaria; a number of cases have been recorded by Joal, *_Journal de Médecine_*, July 10, 1899.

VI.

The Place of Smell in Human Sexual Selections--It has given Place to the Predominance of Vision largely because in Civilized Man it Fails to Act at a Distance--It still Plays a Part by Contributing to the Sympathies or the Antipathies of Intimate Contact.

When we survey comprehensively the extensive field we have here rapidly traversed, it seems not impossible to gain a fairly accurate view of the special place which olfactory sensations play in human sexual selection. The special peculiarity of this group of sensations in man, and that which gives them an importance they would not otherwise possess, is due to the fact that we here witness the decadence of a sense which in man's remote ancestors was the very chiefest avenue of sexual allurements. In man, even the most primitive man,--to some degree even in the apes,--it has declined

in importance to give place to the predominance of vision.[85] Yet, at that lower threshold of acuity at which it persists in man it still bathes us in a more or less constant atmosphere of odors, which perpetually move us to sympathy or to antipathy, and which in their finer manifestations we do not neglect, but even cultivate with the increase of our civilization.

It thus comes about that the grosser manifestations of sexual allurements by smell belong, so far as man is concerned, to a remote animal past which we have outgrown and which, on account of the diminished acuity of our olfactory organs, we could not completely recall even if we desired to; the sense of sight inevitably comes into play long before it is possible for close contact to bring into action the sense of smell. But the latent possibilities of sexual allurements by olfaction, which are inevitably embodied in the nervous structure we have inherited from our animal ancestors, still remain ready to be called into play. They emerge prominently from time to time in exceptional and abnormal persons. They tend to play an unusually larger part in the psychic lives of neurasthenic persons, with their sensitive and comparatively unbalanced nervous systems, and this is doubtless the reason why poets and men of letters have insisted on olfactory impressions so frequently and to so notable a degree; for the same reason sexual inverts are peculiarly susceptible to odors. For a different reason, warmer climates, which heighten all odors and also favor the growth of powerfully odorous plants, lead to a heightened susceptibility to the sexual and other attractions of smell even among normal persons; thus we find a general tendency to delight in odors throughout the East, notably in India, among the ancient Hebrews, and in Mohammedan lands.

Among the ordinary civilized population in Europe the sexual influences of smell play a smaller and yet not altogether negligible part. The diminished prominence of odors only enables them to come into action, as sexual influences, on close contact, when, in some persons at all events, personal odors may have a distinct influence in heightening sympathy or arousing antipathy. The range of variation among individuals is in this matter considerable. In a few persons olfactory sympathy or antipathy is so pronounced that it exerts a decisive influence in their sexual relationships; such persons are of olfactory type. In other persons smell has no part in constituting sexual relationships, but it comes into play in the intimate association of love, and acts as an additional excitant; when reinforced by association such olfactory impressions may at times prove irresistible. Other persons, again, are neutral in this respect, and remain indifferent either to the sympathetic or antipathetic working of

personal odors, unless they happen to be extremely marked. It is probable that the majority of refined and educated people belong to the middle group of those persons who are not of predominantly olfactory type, but are liable from time to time to be influenced in this manner. Women are probably at least as often affected in this manner as men, probably more often.

On the whole, it may be said that in the usual life of man odors play a not inconsiderable part and raise problems which are not without interest, but that their demonstrable part in actual sexual selection--whether in preferential mating or in assortative mating--is comparatively small.

FOOTNOTES:

[85] Moll has a passage on this subject, *Untersuchungen über die Libido Sexualis*. Bd. I, pp. 376-381.

HEARING.

I.

The Physiological Basis of Rhythm--Rhythm as a Physiological Stimulus--The Intimate Relation of Rhythm to Movement--The Physiological Influence of Music on Muscular Action, Circulation, Respiration, etc.--The Place of Music in Sexual Selection among the Lower Animals--Its Comparatively Small Place in Courtship among Mammals--The Larynx and Voice in Man--The Significance of the Pubertal Changes--Ancient Beliefs Concerning the Influence of Music in Morals, Education, and Medicine--Its Therapeutic Uses--Significance of the Romantic Interest in Music at Puberty--Men Comparatively Insusceptible to the Specifically Sexual Influence of Music--Rarity of Sexual Perversions on the Basis of the Sense of Hearing--The Part of Music in Primitive Human Courtship--Women Notably Susceptible to the Specifically Sexual Influence of Music and the Voice.

The sense of rhythm--on which it may be said that the sensory exciting effects of hearing, including music, finally rest--may probably be regarded as a fundamental quality of neuro-muscular tissue. Not only are

the chief physiological functions of the body, like the circulation and the respiration, definitely rhythmical, but our senses insist on imparting a rhythmic grouping even to an absolutely uniform succession of sensations. It seems probable, although this view is still liable to be disputed, that this rhythm is the result of kinæsthetic sensations,--sensations arising from movement or tension started reflexly in the muscles by the external stimuli,--impressing themselves on the sensations that are thus grouped.[86] We may thus say, with Wilks, that music appears to have had its origin in muscular action.[87]

Whatever its exact origin may be, rhythm is certainly very deeply impressed on our organisms. The result is that, whatever lends itself to the neuro-muscular rhythmical tendency of our organisms, whatever tends still further to heighten and develop that rhythmical tendency, exerts upon us a very decidedly stimulating and exciting influence.

All muscular action being stimulated by rhythm, in its simple form or in its more developed form as music, rhythm is a stimulant to work. It has even been argued by Bücher and by Wundt[88] that human song had its chief or exclusive origin in rhythmical vocal accompaniments to systematized work. This view cannot, however, be maintained; systematized work can scarcely be said to exist, even to-day, among most very primitive races; it is much more probable that rhythmical song arose at a period antecedent to the origin of systematized work, in the primitive military, religious, and erotic dances, such as exist in a highly developed degree among the Australians and other savage races who have not evolved co-ordinated systematic labor. There can, however, be no doubt that as soon as systematic work appears the importance of vocal rhythm in stimulating its energy is at once everywhere recognized. Bücher has brought together innumerable examples of this association, and in the march music of soldiers and the heaving and hoisting songs of sailors we have instances that have universally persisted into civilization, although in civilization the rhythmical stimulation of work, physiologically sound as is its basis, tends to die out. Even in the laboratory the influence of simple rhythm in increasing the output of work may be demonstrated; and Féré found with the ergograph that a rhythmical grouping of the movements caused an increase of energy which often more than compensated the loss of time caused by the rhythm.[89]

Rhythm is the most primitive element of music, and the most fundamental. Wallaschek, in his book on *Primitive Music*, and most other writers on the subject are agreed on this point. "Rhythm," remarks an American

anthropologist,[90] "naturally precedes the development of any fine perception of differences in pitch, of time-quality, or of tonality. Almost, if not all, Indian songs," he adds, "are as strictly developed out of modified repetitions of a motive as are the movements of a Mozart or a Beethoven symphony." "In all primitive music," asserts Alice C. Fletcher,[91] "rhythm is strongly developed. The pulsations of the drum and the sharp crash of the rattles are thrown against each other and against the voice, so that it would seem that the pleasure derived by the performers lay not so much in the tonality of the song as in the measured sounds arrayed in contesting rhythm, and which by their clash start the nerves and spur the body to action, for the voice which alone carries the tone is often subordinated and treated as an additional instrument." Groos points out that a melody gives us the essential impression of a _voice that dances_;[92] it is a translation of spatial movement into sound, and, as we shall see, its physiological action on the organism is a reflection of that which, as we have elsewhere found,[93] dancing itself produces, and thus resembles that produced by the sight of movement. Dancing, music, and poetry were primitively so closely allied as to be almost identical; they were still inseparable among the early Greeks. The refrains in our English ballads indicate the dancer's part in them. The technical use of the word "foot" in metrical matters still persists to show that a poem is fundamentally a dance.

Aristotle seems to have first suggested that rhythm and melodies are motions, as actions are motions, and therefore signs of feeling. "All melodies are motions," says Helmholtz. "Graceful rapidity, gravel procession, quiet advance, wild leaping, all these different characters of motion and a thousand others can be represented by successions of tones. And as music expresses these motions it gives an expression also to those mental conditions which naturally evoke similar motions, whether of the body and the voice, or of the thinking and feeling principle itself." (Helmholtz, _On the Sensations of Tone_, translated by A. J. Ellis, 1885, p. 250.)

From another point of view the motor stimulus of music has been emphasized by Cyples: "Music connects with the only sense that can be perfectly manipulated. Its emotional charm has struck men as a great mystery. There appears to be no doubt whatever that it gets all the marvelous effects it has beyond the mere pleasing of the ear, from its random, but multitudinous summonses of the efferent activity, which at its vague challenges stirs

unceasingly in faintly tumultuous irrelevancy. In this way, music arouses aimlessly, but splendidly, the sheer, as yet unfulfilled, potentiality within us." (W. Copies, *The Process of Human Experience*, p. 743.)

The fundamental element of transformed motion in music has been well brought out in a suggestive essay by Goblot ("*La Musique Descriptive*," *Revue Philosophique*, July, 1901): "Sung or played, melody figures to the ear a successive design, a moving arabesque. We talk of *ascending* and *descending* the gamut, of *high* notes or *low* notes; the higher voice of woman is called *soprano*, or *above*, the deeper voice of man is called *bass*. *Grave* tones were so called by the Greeks because they seemed heavy and to incline downward. Sounds seem to be subject to the action of gravity; so that some rise and others fall. Baudelaire, speaking of the prelude to *Lohengrin*, remarks: 'I felt myself *delivered from the bonds of weight*.' And when Wagner sought to represent, in the highest regions of celestial space, the apparition of the angels bearing the Holy Grail to earth, he uses very high notes, and a kind of chorus played exclusively by the violins, divided into eight parts, in the highest notes of their register. The descent to earth of the celestial choir is rendered by lower and lower notes, the progressive disappearance of which represents the reascension to the ethereal regions.

"Sounds seem to rise and fall; that is a fact. It is difficult to explain it. Some have seen in it a habit derived from the usual notation by which the height of the note corresponds to its height in the score. But the impression is too deep and general to be explained by so superficial and recent a cause. It has been suggested also that high notes are generally produced by small and light bodies, low notes by heavy bodies. But that is not always true. It has been said, again, that high notes in nature are usually produced by highly placed objects, while low notes arise from caves and low placed regions. But the thunder is heard in the sky, and the murmur of a spring or the song of a cricket arise from the earth. In the human voice, again, it is said, the low notes seem to resound in the chest, high notes in the head. All this is unsatisfactory. We cannot explain by such coarse analogies an impression which is very precise, and more sensible (this fact has its importance) for an interval of half a tone than for an interval of an octave. It is probable that the true

explanation is to be found in the still little understood connection between the elements of our nervous apparatus.

"Nearly all our emotions tend to produce movement. But education renders us economical of our acts. Most of these movements are repressed, especially in the adult and civilized man, as harmful, dangerous, or merely useless. Some are not completed, others are reduced to a faint incitation which externally is scarcely perceptible. Enough remain to constitute all that is expressive in our gestures, physiognomy, and attitudes. Melodic intervals possess in a high degree this property of provoking impulses of movement, which, even when repressed, leave behind internal sensations and motor images. It would be possible to study these facts experimentally if we had at our disposition a human being who, while retaining his sensations and their motor reactions, was by special circumstances rendered entirely spontaneous like a sensitive automaton, whose movements were neither intentionally produced nor intentionally repressed. In this way, melodic intervals in a hypnotized subject might be very instructive."

A number of experiments of the kind desired by Goblott had already been made by A. de Rochas in a book, copiously illustrated by very numerous instantaneous photographs, entitled *Les Sentiments, la Musique et la Geste*, 1900. Chapter III. De Rochas experimented on a single subject, Lina, formerly a model, who was placed in a condition of slight hypnosis, when various simple fragments of music were performed: recitatives, popular airs, and more especially national dances, often from remote parts of the world. The subject's gestures were exceedingly marked and varied in accordance with the character of the music. It was found that she often imitated with considerable precision the actual gestures of dances she could never have seen. The same music always evoked the same gestures, as was shown by instantaneous photographs. This subject, stated to be a chaste and well-behaved girl, exhibited no indications of definite sexual emotion under the influence of any kind of music. Some account is given in the same volume of other hypnotic experiments with music which were also negative as regards specific sexual phenomena.

It must be noted that, as a physiological stimulus, a single musical note is effective, even apart from rhythm, as is well shown by Féré's experiments with the dynamometer and the ergograph.[94] It is, however,

the influence of music on muscular work which has been most frequently investigated, and both on brief efforts with the dynamometer and prolonged work with the ergograph it has been found to exert a stimulating influence. Thus, Scripture found that, while his own maximum thumb and finger grip with the dynamometer is 8 pounds, when the giant's motive from Wagner's Rheingold is played it rises to 8¾ pounds.[95] With the ergograph Tarchanoff found that lively music, in nervously sensitive persons, will temporarily cause the disappearance of fatigue, though slow music in a minor key had an opposite effect.[96] The varying influence on work with the ergograph of different musical intervals and different keys has been carefully studied by Féré with many interesting results. There was a very considerable degree of constancy in the results. Discords were depressing; most, but not all, major keys were stimulating; and most, but not all, minor keys depressing. In states of fatigue, however, the minor keys were more stimulating than the major, an interesting result in harmony with that stimulating influence of various painful emotions in states of organic fatigue which we have elsewhere encountered when investigating sadism.[97] "Our musical culture," Féré remarks, "only renders more perceptible to us the unconscious relationships which exist between musical art and our organisms. Those whom we consider more endowed in this respect have a deeper penetration of the phenomena accomplished within them; they feel more profoundly the marvelous reactions between the organism and the principles of musical art, they experience more strongly that art is within them." [98] Both the higher and the lower muscular processes, the voluntary and the involuntary, are stimulated by music. Darlington and Talbot, in Titchener's laboratory at Cornell University, found that the estimation of relative weights was aided by music.[99] Lombard found, when investigating the normal variations in the knee-jerk, that involuntary reflex processes are always reinforced by music; a military band playing a lively march caused the knee-jerk to increase at the loud passages and to diminish at the soft passages, while remaining always above the normal level.[100]

With this stimulating influence of rhythm and music on the neuro-muscular system--which may or may not be direct--there is a concomitant influence on the circulatory and breathing apparatus. During recent years a great many experiments have been made on man and animals bearing on the effects of music on the heart and respiration. Perhaps the earliest of these were carried out by the Russian physiologist Dogiel in 1880.[101] His methods were perhaps defective and his results, at all events as regards man, uncertain, but in animals the force and rapidity of the heart were markedly increased. Subsequent investigations have shown very clearly the

influence of music on the circulatory and respiratory systems in man as well as in animals. That music has an apparently direct influence on the circulation of the brain is shown by the observations of Patrizi on a youth who had received a severe wound of the head which had removed a large portion of the skull wall. The stimulus of melody produced an immediate increase in the afflux of blood to the brain.[102]

In Germany the question was investigated at about the same time by Mentz.[103] Observing the pulse with a sphygmograph and Marey tambour he found distinct evidence of an effect on the heart; when attention was given to the music the pulse was quickened, in the absence of attention it was slowed; Mentz also found that pleasurable sensations tended to slow the pulse and disagreeable ones to quicken it.

Binet and Courtier made an elaborate series of experiments on the action of music on the respiration (with the double pneumograph), the heart, and the capillary circulation (with the plethysmograph of Hallion and Comte) on a single subject, a man very sensitive to music and himself a cultured musician. Simple musical sounds with no emotional content accelerated the respiration without changing its regularity or amplitude. Musical fragments, mostly sung, usually well known to the subject, and having an emotional effect on him, produced respiratory irregularity either in amplitude or rapidity of breathing, in two-thirds of the trials. Exciting music, such as military marches, accelerated the breathing more than sad melodies, but the intensity of the excitation had an effect at least as great as its quality, for intense excitations always produced both quickened and deeper breathing. The heart was quickened in harmony with the quickened breathing. Neither breathing nor heart was ever slowed. As regards the capillary pulsation, an influence was exerted chiefly, if not exclusively, by gay and exciting melodies, which produced a shrinking. Throughout the experiments it was found that the most profound physiological effects were exerted by those pieces which the subject found to be most emotional in their influence on him.[104]

Guibaud studied the question on a number of subjects, confirming and extending the conclusions of Binet and Courtier. He found that the reactions of different individuals varied, but that for the same individual reactions were constant. Circulatory reaction was more often manifest than respiratory reaction. The latter might be either a simultaneous modification of depth and of rapidity or of either of these. The circulatory reaction was a peripheral vasoconstriction with diminished fullness of pulse and slight acceleration of cardiac rhythm; there was

never any distinct slowing of heart under the influence of music. Guibaud remarks that when people say they feel a shudder at some passage of music, this sensation of cold finds its explanation in the production of a peripheral vasoconstriction which may be registered by the plethysmograph.[105]

Since music thus directly and powerfully affects the chief vital processes, it is not surprising that it should indirectly influence various viscera and functions. As Tarchanoff and others have demonstrated, it affects the skin, increasing the perspiration; it may produce a tendency to tears; it sometimes produces desire to urinate, or even actual urination, as in Scaliger's case of the Gascon gentleman who was always thus affected on hearing the bagpipes. In dogs it has been shown by Tarchanoff and Wartanoff that auditory stimulation increases the consumption of oxygen 20 per cent., and the elimination of carbonic acid 17 per cent.

In addition to the effects of musical sound already mentioned, it may be added that, as Epstein, of Berne, has shown,[106] the other senses are stimulated under the influence of sound, and notably there is an increase in acuteness of vision which may be experimentally demonstrated. It is probable that this effect of music in heightening the impressions received by the other senses is of considerable significance from our present point of view.

Why are musical tones in a certain order and rhythm pleasurable? asked Darwin in *The Descent of Man*, and he concluded that the question was insoluble. We see that, in reality, whatever the ultimate answer may be, the immediate reason is quite simple. Pleasure is a condition of slight and diffused stimulation, in which the heart and breathing are faintly excited, the neuro-muscular system receives additional tone, the viscera gently stirred, the skin activity increased; and certain combinations of musical notes and intervals act as a physiological stimulus in producing these effects.[107]

Among animals of all kinds, from insects upward, this physiological action appears to exist, for among nearly all of them certain sounds are agreeable and attractive, and other sounds indifferent and disagreeable. It appears that insects of quite different genera show much appreciation of the song of the Cicada.[108] Birds show intense interest in the singing of good performers even of other species. Experiments among a variety of animals in the Zoölogical Gardens with performances on various instruments

showed that with the exception of seals none were indifferent, and all felt a discord as offensive. Many animals showed marked likes and dislikes; thus, a tiger, who was obviously soothed by the violin, was infuriated by the piccolo; the violin and the flute were preferred by most animals.[109]

Most persons have probably had occasion to observe the susceptibility of dogs to music. It may here suffice to give one personal observation. A dog (of mixed breed, partly collie), very well known to me, on hearing a nocturne of Chopin, whined and howled, especially at the more pathetic passages, once or twice catching and drawing out the actual note played; he panted, walked about anxiously, and now and then placed his head on the player's lap. When the player proceeded to a more cheerful piece by Grieg, the dog at once became indifferent, sat down, yawned, and scratched himself; but as soon as the player returned once more to the nocturne the dog at once repeated his accompaniment.

There can be no doubt that among a very large number of animals of most various classes, more especially among insects and birds, the attraction of music is supported and developed on the basis of sexual attraction, the musical notes emitted serving as a sexual lure to the other sex. The evidence on this point was carefully investigated by Darwin on a very wide basis.[110] It has been questioned, some writers preferring to adopt the view of Herbert Spencer,[111] that the singing of birds is due to "overflow of energy," the relation between courtship and singing being merely "a relation of concomitance." This view is no longer tenable; whatever the precise origin of the musical notes of animals may be,--and it is not necessary to suppose that sexual attraction had a large part in their first rudimentary beginnings,--there can now be little doubt that musical sounds, and, among birds, singing, play a very large part indeed in bringing the male and the female together.[112] Usually, it would appear, it is the performance of the male that attracts the female; it is only among very simple and primitive musicians, like some insects, that the female thus attracts the male.[113] The fact that it is nearly always one sex only that is thus musically gifted should alone have sufficed to throw suspicion on any but a sexual solution of this problem of animal song.

It is, however, an exceedingly remarkable fact that, although among insects and lower vertebrates the sexual influence of music is so large, and although among mammals and predominantly in man the emotional and

æsthetic influence of music is so great, yet neither in man nor any of the higher mammals has music been found to exert a predominant sexual influence, or even in most cases any influence at all. Darwin, while calling attention to the fact that the males of most species of mammals use their vocal powers chiefly, and sometimes exclusively, during the breeding-season, adds that "it is a surprising fact that we have not as yet any good evidence that these organs are used by male mammals to charm the female." [114] From a very different standpoint, Féré, in studying the pathology of the human sexual instinct in the light of a very full knowledge of the available evidence, states that he knows of no detailed observations showing the existence of any morbid sexual perversions based on the sense of hearing, either in reference to the human voice or to instrumental music. [115]

When, however, we consider that not only in the animals most nearly related to man, but in man himself, the larynx and the voice undergo a marked sexual differentiation at puberty, it is difficult not to believe that this change has an influence on sexual selection and sexual psychology. At puberty there is a slight hyperæmia of the larynx, accompanied by rapid development alike of the larynx itself and of the vocal cords, which become larger and thicker, while there is an associated change in the voice, which deepens. All these changes are very slight in girls, but very pronounced in boys, whose voices are said to "break" and then become lower by at least an octave. The feminine larynx at puberty only increases in the proportion of 5 to 7, but the masculine larynx in the proportion of 5 to 10. The direct dependence of this change on the general sexual development is shown not merely by its occurrence at puberty, but by the fact that in eunuchs in whom the testicles have been removed before puberty the voice retains its childlike qualities. [116]

As a matter of fact, I believe that we may attach a considerable degree of importance to the voice and to music generally as a method of sexual appeal. On this point I agree with Moll, who remarks that "the sense of hearing here plays a considerable part, and the stimulation received through the ears is much larger than is usually believed." [117] I am not, however, inclined to think that this influence is considerable in its action on men, although Mantegazza remarks, doubtless with a certain truth, that "some women's voices cannot be heard with impunity." It is true that the ancients deprecated the sexual or at all events the effeminating influence of some kinds of music, but they seem to have regarded it as sedative rather than stimulating; the kind of music they approved of as martial and stimulating was the kind most likely to have

sexual effects in predisposed persons.

The Chinese and the Greeks have more especially insisted on the ethical qualities of music and on its moralizing and demoralizing effects. Some three thousand years ago, it is stated, a Chinese emperor, believing that only they who understood music are capable of governing, distributed administrative functions in accordance with this belief. He acted entirely in accordance with Chinese morality, the texts of Confucianism (see translations in the "Sacred Books of the East Series") show clearly that music and ceremony (or social ritual in a wide sense) are regarded as the two main guiding influences of life--music as the internal guide, ceremony as the external guide, the former being looked upon as the more important.

Among the Greeks Menander said that to many people music is a powerful stimulant to love. Plato, in the third book of the Republic, discusses what kinds of music should be encouraged in his ideal state. He does not clearly state that music is ever a sexual stimulant, but he appears to associate plaintive music (mixed Lydian and Hypolydian) with drunkenness, effeminacy, and idleness and considers that such music is "useless even to women that are to be virtuously given, not to say to men." He only admits two kinds of music: one violent and suited to war, the other tranquil and suited to prayer or to persuasion. He sets out the ethical qualities of music with a thoroughness which almost approaches the great Chinese philosopher: "On these accounts we attach such importance to a musical education, because rhythm and harmony sink most deeply into the recesses of the soul, and take most powerful hold of it, bringing gracefulness in their train, and making a man graceful if he be rightly nurtured, ... leading him to commend beautiful objects, and gladly receive them into his soul, and feed upon them, and grow to be noble and good." Plato is, however, by no means so consistent and thorough as the Chinese moralist, for having thus asserted that it is the influence of music which molds the soul into virtue, he proceeds to destroy his position with the statement that "we shall never become truly musical until we know the essential forms of temperance and courage and liberality and munificence," thus moving in a circle. It must be added that the Greek conception of music was very comprehensive and included poetry.

Aristotle took a wider view of music than Plato and admitted a greater variety of uses for it. He was less anxious to exclude those uses which were not strictly ethical. He disapproved, indeed, of the Phrygian harmony as the expression of Bacchic excitement. He accepts, however, the function of music as a katharsis of emotion, a notion which is said to have originated with the Pythagoreans. (For a discussion of Aristotle's views on music, see W.L. Newman, *The Politics of Aristotle*, vol. i, pp. 359-369.)

Athenæus, in his frequent allusions to music, attributes to it many intellectual and emotional properties (e.g., Book XIV, Chapter XXV) and in one place refers to "melodies inciting to lawless indulgence" (Book XIII, Chapter LXXV).

We may gather from the *Priapeia* (XXVI) that cymbals and castanets were the special accompaniment in antiquity of wanton songs and dances: "*cymbala, cum crotalis, pruriginis arma*."

The ancient belief in the moralizing influence of music has survived into modern times mainly in a somewhat more scientific form as a belief in its therapeutic effects in disordered nervous and mental conditions. (This also is an ancient belief as witnessed by the well-known example of David playing to Saul to dispel his melancholia.) In 1729 an apothecary of Oakham, Richard Broune, published a work entitled *Medicina Musica*, in which he argued that music was beneficial in many maladies. In more recent days there have been various experiments and cases brought forward showing its efficacy in special conditions.

An American physician (W.F. Hutchinson) has shown that anæsthesia may be produced with accurately made tuning forks at certain rates of vibration (summarized in the *British Medical Journal*, June 4, 1898). Ferrand in a paper read before the Paris Academy of Medicine in September, 1895, gives reasons for classing some kinds of music as powerful antispasmodics with beneficial therapeutic action. The case was subsequently reported of a child in whom night-terrors were eased by calming music in a minor key. The value of music in lunatic asylums is well recognized; see e.g., Näcke, *Revue de Psychiatrie*, October, 1897. Vaschide and Vurpas (*Comptes Rendus de la Société de Biologie*, December 13, 1902) have recorded the case of a girl of 20, suffering from

mental confusion with excitation and central motor disequilibrium, whose muscular equilibrium was restored and movements rendered more co-ordinated and adaptive under the influence of music.

While there has been much extravagance in the ancient doctrine concerning the effects of music, the real effects are still considerable. Not only is this demonstrated by the experiments already referred to (p. 118), indicating the efficacy of musical sounds as physiological stimulants, but also by anatomical considerations. The roots of the auditory nerves, McKendrick has pointed out, are probably more widely distributed and have more extensive connections than those of any other nerve. The intricate connections of these nerves are still only being unraveled. This points to an explanation of how music penetrates to the very roots of our being, influencing by associational paths reflex mechanisms both cerebral and somatic, so that there is scarcely a function of the body that may not be affected by the rhythmical pulsations, melodic progressions, and harmonic combinations of musical tones. (*Nature*, June 15, 1899, p. 164.)

Just as we are not entitled from the ancient belief in the influence of music on morals or the modern beliefs in its therapeutic influence--even though this has sometimes gone to the length of advocating its use in impotence[118]--to argue that music has a marked influence in exciting the specifically sexual instincts, neither are we entitled to find any similar argument in the fact that music is frequently associated with the love-feelings of youth. Men are often able to associate many of their earliest ideas of love in boyhood with women singing or playing; but in these cases it will always be found that the fascination was romantic and sentimental, and not specifically erotic.[119] In adult life the music which often seems to us to be most definitely sexual in its appeal (such as much of Wagner's *Tristan*) really produces this effect in part from the association with the story, and in part from the intellectual realization of the composer's effort to translate passion into æsthetic terms; the actual effect of the music is not sexual, and it can well be believed that the results of experiments as regards the sexual influence of the *Tristan* music on men under the influence of hypnotism have been, as reported, negative. Helmholtz goes so far as to state that the expression of sexual longing in music is identical with that of religious longing. It is quite true, again, that a soft and gentle voice seems to every normal man as to Lear "an excellent thing in woman," and that a

harsh or shrill voice may seem to deaden or even destroy altogether the attraction of a beautiful face. But the voice is not usually in itself an adequate or powerful method of evoking sexual emotion in a man. Even in its supreme vocal manifestations the sexual fascination exerted by a great singer, though certainly considerable, cannot be compared with that commonly exerted by the actress. Cases have, indeed, been recorded--chiefly occurring, it is probable, in men of somewhat morbid nervous disposition--in which sexual attraction was exerted chiefly through the ear, or in which there was a special sexual sensibility to particular inflections or accents.[120] Féré mentions the case of a young man in hospital with acute arthritis who complained of painful erections whenever he heard through the door the very agreeable voice of the young woman (invisible to him) who superintended the linen.[121] But these phenomena do not appear to be common, or, at all events, very pronounced. So far as my own inquiries go, only a small proportion of men would appear to experience definite sexual feelings on listening to music. And the fact that in woman the voice is so slightly differentiated from that of the child, as well as the very significant fact that among man's immediate or even remote ancestors the female's voice can seldom have served to attract the male, sufficiently account for the small part played by the voice and by music as a sexual allurement working on men.[122]

It is otherwise with women. It may, indeed, be said at the outset that the reasons which make it antecedently improbable that men should be sexually attracted through hearing render it probable that women should be so attracted. The change in the voice at puberty makes the deeper masculine voice a characteristic secondary sexual attribute of man, while the fact that among mammals generally it is the male that is most vocal--and that chiefly, or even sometimes exclusively, at the rutting season--renders it antecedently likely that among mammals generally, including the human species, there is in the female an actual or latent susceptibility to the sexual significance of the male voice,[123] a susceptibility which, under the conditions of human civilization, may be transferred to music generally. It is noteworthy that in novels written by women there is a very frequent attentiveness to the qualities of the hero's voice and to its emotional effects on the heroine.[124] We may also note the special and peculiar personal enthusiasm aroused in women by popular musicians, a more pronounced enthusiasm than is evoked in them by popular actors.

As an interesting example of the importance attached by women novelists to the effects of the male voice I may refer to George Eliot's *Mill on the Floss*, probably the most intimate and

personal of George Eliot's works. In Book VI of this novel the influence of Stephen Guest (a somewhat commonplace young man) over Maggie Tulliver is ascribed almost exclusively to the effect of his base voice in singing. We are definitely told of Maggie Tulliver's "sensibility to the supreme excitement of music." Thus, on one occasion, "all her intentions were lost in the vague state of emotion produced by the inspiring duet--emotion that seemed to make her at once strong and weak: strong for all enjoyment, weak for all resistance. Poor Maggie! She looked very beautiful when her soul was being played on in this way by the inexorable power of sound. You might have seen the slightest perceptible quivering through her whole frame as she leaned a little forward, clasping her hands as if to steady herself; while her eyes dilated and brightened into that wideopen, childish expression of wondering delight, which always came back in her happiest moments." George Eliot's novels contain many allusions to the powerful emotional effects of music.

It is unnecessary to refer to Tolstoy's Kreutzer Sonata, in which music is regarded as the Galeotto to bring lovers together--"the connecting bond of music, the most refined lust of the senses."

In primitive human courtship music very frequently plays a considerable part, though not usually the sole part, being generally found as the accompaniment of the song and the dance at erotic festivals.[125] The Gilas, of New Mexico, among whom courtship consists in a prolonged serenade day after day with the flute, furnish a somewhat exceptional case. Savage women are evidently very attentive to music; Backhouse (as quoted, by Ling Roth[126]) mentions how a woman belonging to the very primitive and now extinct Tasmanian race, when shown a musical box, listened "with intensity; her ears moved like those of a dog or horse, to catch the sound."

I have found little evidence to show that music, except in occasional cases, exerts even the slightest specifically sexual effect on men, whether musical or unmusical. But I have ample evidence that it very frequently exerts to a slight but definite extent such an influence on women, even when quite normal. Judging from my own inquiries it would, indeed, seem likely that the majority of normal educated women are liable to experience some degree of definite sexual excitement from music; one states that orchestral music generally tends to produce this effect;

another finds it chiefly from Wagner's music; another from military music, etc. Others simply state--what, indeed, probably expresses the experience of most persons of either sex--that it heightens one's mood. One lady mentions that some of her friends, whose erotic feelings are aroused by music, are especially affected in this way by the choral singing in Roman Catholic churches.[127]

In the typical cases just mentioned, all fairly normal and healthy women, the sexual effects of music though definite were usually quite slight. In neuropathic subjects they may occasionally be more pronounced. Thus, a medical correspondent has communicated to me the case of a married lady with one child, a refined, very beautiful, but highly neurotic, woman, married to a man with whom she has nothing in common. Her tastes lie in the direction of music; she is a splendid pianist, and her highly trained voice would have made a fortune. She confesses to strong sexual feelings and does not understand why intercourse never affords what she knows she wants. But the hearing of beautiful music, or at times the excitement of her own singing, will sometimes cause intense orgasm.

Vaschide and Vurpas, who emphasize the sexually stimulating effects of music, only bring forward one case in any detail, and it is doubtless significant that this case is a woman. "While listening to a piece of music X changes expression, her eyes become bright, the features are accentuated, a smile begins to form, an expression of pleasure appears, the body becomes more erect, there is a general muscular hypertonicity. X tells us that as she listens to the music she experiences sensations very like those of normal intercourse. The difference chiefly concerns the local genital apparatus, for there is no flow of vaginal mucus. On the psychic side the resemblance is marked." (Vaschide and Vurpas, "Du Coefficient Sexual de l'Impulsion Musicale," _Archives de Neurologie_, May, 1904.)

It is sometimes said, or implied, that a woman (or a man) sings better under the influence of sexual emotion. The writer of an article already quoted, on "Woman in her Psychological Relations" (_Journal of Psychological Medicine_, 1851), mentions that "a young lady remarkable for her musical and poetical talents naïvely remarked to a friend who complimented her upon her singing: 'I never sing half so well as when I've had a love-fit.'" And George Eliot says. "There is no feeling, perhaps, except the extremes of fear and grief, that does not make a man

sing or play the better." While, however, it may be admitted that some degree of general emotional exaltation may exercise a favorable influence on the singing voice, it is difficult to believe that definite physical excitement at or immediately before the exercise of the voice can, as a rule, have anything but a deleterious effect on its quality. It is recognized that tenors (whose voices resemble those of women more than basses, who are not called upon to be so careful in this respect) should observe rules of sexual hygiene; and menstruation frequently has a definite influence in impairing the voice (H. Ellis, Man and Woman, fourth edition, p. 290). As the neighborhood of menstruation is also the period when sexual excitement is most likely to be felt, we have here a further indication that sexual emotion is not favorable to singing. I agree with the remarks of a correspondent, a musical amateur, who writes: "Sexual excitement and good singing do not appear to be correlated. A woman's emotional capacity in singing or acting may be remotely associated with hysterical neuroses, but is better evinced for art purposes in the absence of disturbing sexual influences. A woman may, indeed, fancy herself the heroine of a wanton romance and 'let herself go' a little in singing with improved results. But a memory of sexual ardors will help no woman to make the best of her voice in training. Some women can only sing their best when they think of the other women they are outsinging. One girl 'lets her soul go out into her voice' thinking of jamroll, another thinking of her lover (when she has none), and most, no doubt, when they think of nothing. But no woman is likely to 'find herself' in an artistic sense because she has lost herself in another sense--not even if she has done so quite respectably."

The reality of the association between the sexual impulse and music--and, indeed, art generally--is shown by the fact that the evolution of puberty tends to be accompanied by a very marked interest in musical and other kinds of art. Lancaster, in a study of this question among a large number of young people (without reference to difference in sex, though they were largely female), found that from 50 to 75 per cent of young people feel an impulse to art about the period of puberty, lasting a few months, or at most a year or two. It appears that 464 young people showed an increased and passionate love for music, against only 102 who experienced no change in this respect. The curve culminates at the age of 15 and falls rapidly after 16. Many of these cases were really quite unmusical.[128]

[119] A typical example occurs in the early life of History I in Appendix B to vol. iii of these *_Studies_*.

[120] Vaschide and Vurpas state (*_Archives de Neurologie_*, May, 1904) that in their experience music may facilitate sexual approaches in some cases of satiety, and that in certain pathological cases the sexual act can only be accomplished under the influence of music.

[121] Féré, *_L'Instinct Sexuel_*, p. 137. Bloch (*_Beiträge_*, etc., vol. ii, p. 355) quotes some remarks of Kistemaecker's concerning the sound of women's garments and the way in which savages and sometimes civilized

women cultivate this rustling and clinking. Gutzkow, in his _Autobiography_, said that the _frou-frou_ of a woman's dress was the music of the spheres to him.

[122] The voice is doubtless a factor of the first importance in sexual attraction among the blind. On this point I have no data. The expressiveness of the voice to the blind, and the extent to which their likes and dislikes are founded on vocal qualities, is well shown by an interesting paper written by an American physician, blind from early infancy, James Cocke, "The Voice as an Index to the Soul," _Arena_, January, 1894.

[123] Long before Darwin had set forth his theory of sexual selection Laycock had pointed out the influence which the voice of the male, among man and other animals, exerts on the female (_Nervous Diseases of Women_, p. 74). And a few years later the writer of a suggestive article on "Woman in her Psychological Relations" (_Journal of Psychological Medicine_, 1851) remarked: "The sonorous voice of the male man is exactly analogous in its effect on woman to the neigh and bellow of other animals. This voice will have its effect on an amorous or susceptible organization much in the same way as color and the other visual ovarian stimuli." The writer adds that it exercises a still more important influence when modulated to music: "in this respect man has something in common with insects as well as birds."

[124] Groos refers more than once to the important part played in German novels written by women by what one of them terms the "bearded male voice."

[125] Various instances are quoted in the third volume of these _Studies_ when discussing the general phenomena of courtship and tumescence, "An Analysis of the Sexual Impulse."

[126] _The Tasmanians_, p. 20.

[127] An early reference to the sexual influence of music on women may perhaps be found in a playful passage in Swift's _Martinus Scriblerus_ (possibly due to his medical collaborator, Arbuthnot): "Does not Ælian tell how the Libyan mares were excited to horsing by music? (which ought to be a caution to modest women against frequenting operas)." _Memoirs of Martinus Scriblerus_, Book I, Chapter 6. (The reference is to Ælian, _Hist. Animal_, lib. XI, cap. 18, and lib. XII, cap. 44.)

II.

Summary--Why the Influence of Music in Human Sexual Selection is Comparatively Small.

We have seen that it is possible to set forth in a brief space the facts at present available concerning the influence on the pairing impulse of stimuli acting through the ear. They are fairly simple and uncomplicated; they suggest few obscure problems which call for analysis; they do not bring before us any remarkable perversions of feeling.

At the same time, the stimuli to sexual excitement received through the sense of hearing, although very seldom of exclusive or preponderant influence, are yet somewhat more important than is usually believed. Primarily the voice, and secondarily instrumental music, exert a distinct effect in this direction, an effect representing a specialization of a generally stimulating physiological influence which all musical sounds exercise upon the organism. There is, however, in this respect, a definite difference between the sexes. It is comparatively rare to find that the voice or instrumental music, however powerful its generally emotional influence, has any specifically sexual effect on men. On the other hand, it seems probable that the majority of women, at all events among the educated classes, are liable to show some degree of sexual sensibility to the male voice or to instrumental music.

It is not surprising to find that music should have some share in arousing sexual emotion when we bear in mind that in the majority of persons the development of sexual life is accompanied by a period of special interest in music. It is not unexpected that the specifically sexual effects of the voice and music should be chiefly experienced by women when we remember that not only in the human species is it the male in whom the larynx and voice are chiefly modified at puberty, but that among mammals generally it is the male who is chiefly or exclusively vocal at the period of sexual activity; so that any sexual sensibility to vocal manifestations must be

chiefly or exclusively manifested in female mammals.

At the best, however, although æsthetic sensibility to sound is highly developed and emotional sensibility to it profound and widespread, although women may be thrilled by the masculine voice and men charmed by the feminine voice, it cannot be claimed that in the human species hearing is a powerful factor in mating. This sense has here suffered between the lower senses of touch and smell, on the one hand, with their vague and massive appeal, and the higher sense, vision, on the other hand, with its exceedingly specialized appeal. The position of touch as the primary and fundamental sense is assured. Smell, though in normal persons it has no decisive influence on sexual attraction, acts by virtue of its emotional sympathies and antipathies, while, by virtue of the fact that among man's ancestors it was the fundamental channel of sexual sensibility, it furnishes a latent reservoir of impressions to which nervously abnormal persons, and even normal persons under the influence of excitement or of fatigue, are always liable to become sensitive. Hearing, as a sense for receiving distant perceptions has a wider field than is in man possessed by either touch or smell. But here it comes into competition with vision, and vision is, in man, the supreme and dominant sense.[129] We are always more affected by what we see than by what we hear. Men and women seldom hear each other without speedily seeing each other, and then the chief focus of interest is at once transferred to the visual centre.[130] In human sexual selection, therefore, hearing plays a part which is nearly always subordinated to that of vision.

FOOTNOTES:

[129] Nietzsche has even suggested that among primitive men delicacy of hearing and the evolution of music can only have been produced under conditions which made it difficult for vision to come into play: "The ear, the organ of fear, could only have developed, as it has, in the night and in the twilight of dark woods and caves.... In the brightness the ear is less necessary. Hence the character of music as an art of night and twilight." (*Morgenröthe*, p. 230.)

[130] At a concert most people are instinctively anxious to *see* the performers, thus distracting the purely musical impression, and the reasonable suggestion of Goethe that the performers should be invisible is still seldom carried into practice.

VISION

I.

Primacy of Vision in Man--Beauty as a Sexual Allurement--The Objective Element in Beauty--Ideals of Feminine Beauty in Various Parts of the World--Savage Women sometimes Beautiful from European Point of View--Savages often Admire European Beauty--The Appeal of Beauty to some Extent Common even to Animals and Man.

Vision is the main channel by which man receives his impressions. To a large extent it has slowly superseded all the other senses. Its range is practically infinite; it brings before us remote worlds, it enables us to understand the minute details of our own structure. While apt for the most abstract or the most intimate uses, its intermediate range is of universal service. It furnishes the basis on which a number of arts make their appeal to us, and, while thus the most æsthetic of the senses, it is the sense on which we chiefly rely in exercising the animal function of nutrition. It is not surprising, therefore, that from the point of view of sexual selection vision should be the supreme sense, and that the love-thoughts of men have always been a perpetual meditation of beauty.

It would be out of place here to discuss comparatively the origins of our ideas of beauty. That is a question which belongs to æsthetics, not to sexual psychology, and it is a question on which æstheticians are not altogether in agreement. We need not even be concerned to make any definite assertion on the question whether our ideas of sexual beauty have developed under the influence of more general and fundamental laws, or whether sexual ideals themselves underlie our more general conceptions of beauty. Practically, so far as man and his immediate ancestors are concerned, the sexual and the extra-sexual factors of beauty have been interwoven from the first. The sexually beautiful object must have appealed to fundamental physiological aptitudes of reaction; the generally beautiful object must have shared in the thrill which the specifically sexual object imparted. There has been an inevitable action and reaction throughout. Just as we found that the sexual and the non-sexual influences of agreeable odors throughout nature are inextricably mingled, so it is with the motives that make an object

beautiful to our eyes.[131]

The sexual element in the constitution of beauty is well recognized even by those writers who concern themselves exclusively with the æsthetic conception of beauty or with its relation to culture. It is enough to quote two or three testimonies on this point. "The whole sentimental side of our æsthetic sensibility," remarks Santayana, "--without which it would be perceptive and mathematical rather than æsthetic,--is due to our sexual organization remotely stirred.... If anyone were desirous to produce a being with a great susceptibility to beauty, he could not invent an instrument better designed for that object than sex. Individuals that need not unite for the birth and rearing of each generation might retain a savage independence. For them it would not be necessary that any vision should fascinate, or that any languor should soften, the prying cruelty of the eye. But sex endows the individual with a dumb and powerful instinct, which carries his body and soul continually toward another; makes it one of the dearest enjoyments of his life to select and pursue a companion, and joins to possession the keenest pleasure, to rivalry the fiercest rage, and to solitude an eternal melancholy. What more could be needed to suffuse the world with the deepest meaning and beauty? The attention is fixed upon a well-defined object, and all the effects it produces in the mind are easily regarded as powers or qualities of that object.... To a certain extent this kind of interest will center in the proper object of sexual passion, and in the special characteristics of the opposite sex[131]; and we find, accordingly, that woman is the most lovely object to man, and man, if female modesty would confess it, the most interesting to woman. But the effects of so fundamental and primitive a reaction are much more general. Sex is not the only object of sexual passion. When love lacks its specific object, when it does not yet understand itself, or has been sacrificed to some other interest, we see the stifled fire bursting out in various directions.... Passion then overflows and visibly floods those neighboring regions which it had always secretly watered. For the same nervous organization which sex involves, with its necessarily wide branchings and associations in the brain, must be partially stimulated by other objects than its specific or ultimate one; especially in man, who, unlike some of the lower animals, has not his instincts clearly distinct and intermittent,

but always partially active, and never active in isolation. We may say, then, that for man all nature is a secondary object of sexual passion, and that to this fact the beauty of nature is largely due." (G. Santayana, *The Sense of Beauty*, pp. 59-62.)

Not only is the general fact of sexual attraction an essential element of æsthetic contemplation, as Santayana remarks, but we have to recognize also that specific sexual emotion properly comes within the æsthetic field. It is quite erroneous, as Groos well points out, to assert that sexual emotion has no æsthetic value. On the contrary, it has quite as much value as the emotion of terror or of pity. Such emotion, must, however, be duly subordinated to the total æsthetic effect. (K. Groos, *Der Æsthetische Genuss*, p. 151.)

"The idea of beauty," Remy de Gourmont says, "is not an unmixed idea; it is intimately united with the idea of carnal pleasure. Stendhal obscurely perceived this when he defined beauty as 'a promise of happiness.' Beauty is a woman, and women themselves have carried docility to men so far as to accept this aphorism which they can only understand in extreme sexual perversion.... Beauty is so sexual that the only uncontested works of art are those that simply show the human body in its nudity. By its perseverance in remaining purely sexual Greek statuary has placed itself forever above all discussion. It is beautiful because it is a beautiful human body, such a one as every man or every woman would desire to unite with in the perpetuation of the race.... That which inclines to love seems beautiful; that which seems beautiful inclines to love. This intimate union of art and of love is, indeed, the only explanation of art. Without this genital echo art would never have been born and never have been perpetuated. There is nothing useless in these deep human depths; everything which has endured is necessary. Art is the accomplice of love. When love is taken away there is no art; when art is taken away love is nothing but a physiological need." (Remy de Gourmont, *Culture des Idées*, 1900, p. 103, and *Mercure de France*, August, 1901, pp. 298 et seq.)

Beauty as incarnated in the feminine body has to some extent become the symbol of love even for women. Colin Scott finds that it is common among women who are not inverted for female beauty whether on the stage or in art to arouse sexual emotion to a

greater extent than male beauty, and this is confirmed by some of the histories I have recorded in the Appendix to the third volume of these Studies. Scott considers that female beauty has come to be regarded as typical of ideal beauty, and thus tends to produce an emotional effect on both sexes alike. It is certainly rare to find any æsthetic admiration of men among women, except in the case of women who have had some training in art. In this matter it would seem that woman passively accepts the ideals of man. "Objects which excite a man's desire," Colin Scott remarks, "are often, if not generally, the same as those affecting woman. The female body has a sexually stimulating effect upon both sexes. Statues of female forms are more liable than those of male form to have a stimulating effect upon women as well as men. The evidence of numerous literary expressions seems to show that under the influence of sexual excitement a woman regards her body as made for man's gratification, and that it is this complex emotion which forms the initial stage, at least, of her own pleasure. Her body is the symbol for her partner, and indirectly for her, through his admiration of it, of their mutual joy and satisfaction." (Colin Scott, "Sex and Art," American Journal of Psychology, vol. vii, No. 2, p. 206; also private letter.)

At the same time it must be remembered that beauty and the conception of beauty have developed on a wider basis than that of the sexual impulse only, and also that our conceptions of the beautiful, even as concerns the human form, are to some extent objective, and may thus be in part reduced to law. Stratz, in his books on feminine beauty, and notably in Die Schönheit des Weiblichen Körpers, insists on the objective element in beauty. Papillault, again, when discussing the laws of growth and the beauty of the face, argues that beauty of line in the face is objective, and not a creation of fancy, since it is associated with the highest human functions, moral and social. He remarks on the contrast between the prehistoric man of Chancelade,--delicately made, with elegant face and high forehead,--who created the great Magdalenian civilization, and his seemingly much more powerful, but less beautiful, predecessor, the man of Spy, with enormous muscles and powerful jaws. (Bulletin de la Société d'Anthropologie, 1899, p. 220.)

The largely objective character of beauty is further indicated by the fact that to a considerable extent beauty is the expression

of health. A well and harmoniously developed body, tense muscles, an elastic and finely toned skin, bright eyes, grace and animation of carriage--all these things which are essential to beauty are the conditions of health. It has not been demonstrated that there is any correlation between beauty and longevity, and the proof would not be easy to give, but it is quite probable that such a correlation may exist, and various indications point in this direction. One of the most delightful of Opie's pictures is the portrait of Pleasance Reeve (afterward Lady Smith) at the age of 17. This singularly beautiful and animated brunette lived to the age of 104. Most people are probably acquainted with similar, if less marked, cases of the same tendency.

The extreme sexual importance of beauty, so far, at all events, as conscious experience is concerned is well illustrated by the fact that, although three other senses may and often do play a not inconsiderable part in the constitution of a person's sexual attractiveness,--the tactile element being, indeed, fundamental,--yet in nearly all the most elaborate descriptions of attractive individuals it is the visible elements that are in most cases chiefly emphasized. Whether among the lowest savages or in the highest civilization, the poet and story-teller who seeks to describe an ideally lovely and desirable woman always insists mainly, and often exclusively, on those characters which appeal to the eye. The richly laden word beauty is a synthesis of complex impressions obtained through a single sense, and so simple, comparatively, and vague are the impressions derived from the other senses that none of them can furnish us with any corresponding word.

Before attempting to analyze the conception of beauty, regarded in its sexual appeal to the human mind, it may be well to bring together a few fairly typical descriptions of a beautiful woman as she appears to the men of various nations.

In an Australian folklore story taken down from the lips of a native some sixty years ago by W. Dunlop (but evidently not in the native's exact words) we find this description of an Australian beauty: "A man took as his wife a beautiful girl who had long, glossy hair hanging around her face and down her shoulders, which were plump and round. Her face was adorned with red clay and her person wrapped in a fine large opossum rug fastened by a pin formed from the small bone of the kangaroo's leg, and also by a string attached to a wallet made of rushes

neatly plaited of small strips skinned from their outside after they had been for some time exposed to the heat of the fire; which being thrown on her back, the string passing under one arm and across her breast, held the soft rug in a fanciful position of considerable elegance; and she knew well how to show to advantage her queenlike figure when she walked with her polished yam stick held in one of her small hands and her little feet appearing below the edge of the rug" (W. Dunlop, "Australian Folklore Stories," *Journal of the Anthropological Institute*, August and November, 1898, p. 27).

A Malay description of female beauty is furnished by Skeat. "The brow (of the Malay Helen for whose sake a thousand desperate battles are fought in Malay romances) is like the one-day-old moon; her eyebrows resemble 'pictured clouds,' and are 'arched like the fighting-cock's (artificial) spur'; her cheek resembles the 'sliced-off cheek of a mango'; her nose, 'an opening jasmine bud'; her hair, the 'wavy blossom shoots of the areca-palm'; slender is her neck, 'with a triple row of dimples'; her bosom ripening, her waist 'lissom as the stalk of a flower,' her head; 'of a perfect oval' (literally, bird's-egg shaped), her fingers like the leafy 'spears of lemon-grass' or the 'quills of the porcupine,' her eyes 'like the splendor of the planet Venus,' and her lips 'like the fissure of a pomegranate.'" (W.W. Skeat, *Malay Magic*, 1900, p. 363.)

In Mitford's *Tales of Old Japan* (vol. i, p. 215) a "peerlessly beautiful girl of 16" is thus described: "She was neither too fat nor too thin, neither too tall nor too short; her face was oval, like a melon-seed, and her complexion fair and white;; her eyes were narrow and bright, her teeth small and even; her nose was aquiline, and her mouth delicately formed, with lovely red lips; her eyebrows were long and fine; she had a profusion of long black hair; she spoke modestly, with a soft, sweet voice, and when she smiled, two lovely dimples appeared in her cheeks; in all her movements she was gentle and refined." The Japanese belle of ancient times, Dr. Nagayo Sensai remarks (*Lancet*, February 15, 1890) had a white face, a long, slender throat and neck, a narrow chest, small thighs, and small feet and hands. Bälz, also, has emphasized the ethereal character of the Japanese ideal of feminine beauty, delicate, pale and slender, almost uncanny; and Stratz, in his interesting book, *Die Körperformen in Kunst und*

Leben der Japaner_ (second edition, 1904), has dealt fully with the subject of Japanese beauty.

The Singalese are great connoisseurs of beauty, and a Kandyan deeply learned in the matter gave Dr. Davy the following enumeration of a woman's points of beauty: "Her hair should be voluminous, like the tail of the peacock, long, reaching to her knees, and terminating in graceful curls; her eyebrows should resemble the rainbow, her eyes, the blue sapphire and the petals of the blue manilla-flower. Her nose should be like the bill of the hawk; her lips should be bright and red, like coral or the young leaf of the iron-tree. Her teeth should be small, regular, and closely set, and like jessamine buds. Her neck should be large and round, resembling the berrigodea. Her chest should be capacious; her breasts, firm and conical, like the yellow cocoa-nut, and her waist small--almost small enough to be clasped by the hand. Her hips should be wide; her limbs tapering; the soles of her feet, without any hollow, and the surface of her body in general soft, delicate, smooth, and rounded, without the asperities of projecting bones and sinews." (J. Davy, _An Account of the Interior of Ceylon_, 1821, p. 110.)

The "Padmini," or lotus-woman, is described by Hindu writers as the type of most perfect feminine beauty. "She in whom the following signs and symptoms appear is called a _Padmini_: Her face is pleasing as the full moon; her body, well clothed with flesh, is as soft as the Shiras or mustard flower; her skin is fine, tender, and fair as the yellow lotus, never dark colored. Her eyes are bright and beautiful as the orbs of the fawn, well cut, and with reddish corners. Her bosom is hard, full, and high; she; has a good neck; her nose is straight and lovely; and three folds or wrinkles cross her middle--about the umbilical region. Her _yoni_ [vulva] resembles the opening lotus bud, and her love-seed is perfumed like the lily that has newly burst. She walks with swanlike [more exactly, flamingolike] gait, and her voice is low and musical as the note of the Kokila bird [the Indian cuckoo]; she delights in white raiment, in fine jewels, and in rich dresses. She eats little, sleeps lightly, and being as respectful and religious as she is clever and courteous, she is ever anxious to worship the gods and to enjoy the conversation of Brahmans. Such, then, is the Padmini, or lotus-woman." (_The Kama Sutra of Vatsyayana_, 1883, p. 11.)

The Hebrew ideal of feminine beauty is set forth in various passages of the _Song of Songs_. The poem is familiar, and it will suffice to quote one passage:--

"How beautiful are thy feet in sandals, O prince's daughter!
Thy rounded thighs are like jewels,
The work of the hands of a cunning workman.
Thy navel is like a rounded goblet
Wherein no mingled wine is wanting;
Thy belly is like a heap of wheat
Set about with lilies.
Thy two breasts are like two fawns
They are twins of a roe.
Thy neck is like the tower of ivory;
Thine eyes as the pools in Heshbon, by the gate of Bathrabbim;
Thy nose is like the tower of Lebanon
That looketh toward Damascus.
Thine head upon thee is like Carmel
And the hair of thine head like purple;
The king is held captive in the tresses thereof.
This thy stature is like to a palm-tree,
And thy breasts to clusters of grapes,
And the smell of thy breath like apples,
And thy mouth like the best wine."

And the man is thus described in the same poem:--

"My beloved is fair and ruddy,
The chiefest among ten thousand.
His head as the most fine gold,
His locks are bushy (or curling), and black as a raven.
His eyes are like doves beside the water-brooks,
Washed with milk and fitly set.
His cheeks are as a bed of spices, as banks of sweet herbs;
His lips are as lilies, dropping liquid myrrh.
His hands are as rings of gold, set with beryl;
His body is as ivory work, overlaid with sapphires.
His legs are as pillars of marble, set upon sockets of fine gold.
His aspect is like Lebanon, excellent as the cedars.
His mouth is most sweet; yea, he is altogether lovely."

"The maiden whose loveliness inspires the most impassioned expressions in Arabic poetry," Lane states, "is celebrated for her slender figure: She is like the cane among plants, and is elegant as a twig of the oriental willow. Her face is like the full moon, presenting the strongest contrast to the color of her hair, which is of the deepest hue of night, and falls to the middle of her back (Arab ladies are extremely fond of full and long hair). A rosy blush overspreads the center of each cheek; and a mole is considered an additional charm. The Arabs, indeed, are particularly extravagant in their admiration of this natural beauty spot, which, according to its place, is compared to a drop of ambergris upon a dish of alabaster or upon the surface of a ruby. The eyes of the Arab beauty are intensely black,[132] large, and long, of the form of an almond: they are full of brilliancy; but this is softened by long silken lashes, giving a tender and languid expression that is full of enchantment and scarcely to be improved by the adventitious aid of the black border of kohl; for this the lovely maiden adds rather for the sake of fashion than necessity, having what the Arabs term natural kohl. The eyebrows are thin and arched; the forehead is wide and fair as ivory; the nose straight; the mouth, small; the lips of a brilliant red; and the teeth, like pearls set in coral. The forms of the bosom are compared to two pomegranates; the waist is slender; the hips are wide and large; the feet and hands, small; the fingers, tapering, and their extremities dyed with the deep orange tint imparted by the leaves of the henna."

Lane adds a more minute analysis from an unknown author quoted by El-Ishákee: "Four things in a woman should be black--the hair of the head, the eyebrows, the eyelashes, and the dark part of the eyes; four white--the complexion of the skin, the white of the eyes, the teeth, and the legs; four red--the tongue, the lips, the middle of the cheeks, and the gums; four round--the head, the neck, the forearms, and the ankles; four long--the back, the fingers, the arms, and the legs; four wide--the forehead, the eyes, the bosom, and the hips; four fine--the eyebrows, the nose, the lips, and the fingers; four thick--the lower part of the back, the thighs, the calves of the legs, and the knees; four small--the ears, the breasts, the hands, and the feet." (E.W. Lane, Arabian Society in the Middle Ages, 1883, pp. 214-216.)

A Persian treatise on the figurative terms relating to beauty shows that the hair should be black, abundant, and wavy, the eyebrows dark and arched. The eyelashes also must be dark, and like arrows from the bow of the eyebrows. There is, however, no insistence on the blackness of the eyes. We hear of four varieties of eye: the dark-gray eye (or narcissus eye); the narrow, elongated eye of Turkish beauties; the languishing, or love-intoxicated, eye; and the wine-colored eye. Much stress is laid on the quality of brilliancy. The face is sometimes described as brown, but more especially as white and rosy. There are many references to the down on the lips, which is described as greenish (sometimes bluish) and compared to herbage. This down and that on the cheeks and the stray hairs near the ears were regarded as very great beauties. A beauty spot on the chin, cheek, or elsewhere was also greatly admired, and evoked many poetic comparisons. The mouth must be very small. In stature a beautiful woman must be tall and erect, like the cypress or the maritime pine. While the Arabs admired the rosiness of the legs and thighs, the Persians insisted on white legs and compared them to silver and crystal. (_Anis El-Ochchâq_, by Shereef-Eddin Romi, translated by Huart, _Bibliothèque de l'Ecole des Hautes Etudes_, Paris, fasc. 25, 1875.)

In the story of Kamaralzaman in the _Arabian Nights_ El-Sett Budur is thus described: "Her hair is so brown that it is blacker than the separation of friends. And when it is arrayed in three tresses that reach to her feet I seem to see three nights at once.

"Her face is as white as the day on which friends meet again. If I look on it at the time of the full moon I see two moons at once.

"Her cheeks are formed of an anemone divided into two corollas; they have the purple tinge of wine, and her nose is straighter and more delicate than the finest sword-blade.

"Her lips are colored agate and coral; her tongue secretes eloquence; her saliva is more desirable than the juice of grapes.

"But her bosom, blessed be the Creator, is a living seduction. It

bears twin breasts of the purest ivory, rounded, and that may be held within the five fingers of one hand.

"Her belly has dimples full of shade and arranged with the harmony of the Arabic characters on the seal of a Coptic scribe in Egypt. And the belly gives origin to her finely modeled and elastic waist.

"At the thought of her flanks I shudder, for thence depends a mass so weighty that it obliges its owner to sit down when she has risen and to rise when she lies.

"Such are her flanks, and from them descend, like white marble, her glorious thighs, solid and straight, united above beneath their crown. Then come the legs and the slender feet, so small that I am astounded they can bear so great a weight."

An Egyptian stela in the Louvre sings the praise of a beautiful woman, a queen who died about 700 B.C., as follows: "The beloved before all women, the king's daughter who is sweet in love, the fairest among women, a maid whose like none has seen. Blacker is her hair than the darkness of night, blacker than the berries of the blackberry bush (?). Harder are her teeth (?) than the flints on the sickle. A wreath of flowers is each of her breasts, close nestling on her arms." Wiedemann, who quotes this, adds: "During the whole classic period of Egyptian history with few exceptions (such, for example, as the reign of that great innovator, Amenophis IV) the ideal alike for the male and the female body was a slender and but slightly developed form. Under the Ethiopian rule and during the Ptolemaic period in Egypt itself we find, for the first time, that the goddesses are represented with plump and well-developed outlines. Examination of the mummies shows that the earlier ideal was based upon actual facts, and that in ancient Egypt slender, sinewy forms distinguished both men and women. Intermarriage with other races and harem life may have combined in later times to alter the physical type, and with it to change also the ideal of beauty." (A. Wiedemann, *Popular Literature in Ancient Egypt*, p. 7.)

Commenting on Plato's ideas of beauty in the *Banquet* Eméric-David gives references from Greek literature showing that the typical Greek beautiful woman must be tall, her body supple,

her fingers long, her foot small and light, the eyes clear and moderately large, the eyebrows slightly arched and almost meeting, the nose straight and firm, nearly--but not quite--aquiline, the breath sweet as honey. (Eméric-David, *Recherches sur l'Art Statuaire*, new edition, 1863, p. 42.)

At the end of classic antiquity, probably in the fifth century, Aristænetus in his first Epistle thus described his mistress Lais: "Her cheeks are white, but mixed in imitation of the splendor of the rose; her lips are thin, by a narrow space separated from the cheeks, but more red; her eyebrows are black and divided in the middle; the nose straight and proportioned to the thin lips; the eyes large and bright, with very black pupils, surrounded by the clearest white, each color more brilliant by contrast. Her hair is naturally curled, and, as Homer's saying is, like the hyacinth. The neck is white and proportioned to the face, and though unadorned more conspicuous by its delicacy; but a necklace of gems encircles it, on which her name is written in jewels. She is tall and elegantly dressed in garments fitted to her body and limbs. When dressed her appearance is beautiful; when undressed she is all beauty. Her walk is composed and slow; she looks like a cypress or a palm stirred by the wind. I cannot describe how the swelling, symmetrical breasts raise the constraining vest, nor how delicate and supple her limbs are. And when she speaks, what sweetness in her discourse!"

Renier has studied the feminine ideal of the Provençal poets, the troubadours who used the "langue d'oc." "They avoid any description of the feminine type. The indications refer in great part to the slender, erect, fresh appearance of the body, and to the white and rosy coloring. After the person generally, the eyes receive most praise; they are sweet, amorous, clear, smiling, and bright. The color is never mentioned. The mouth is laughing, and vermilion, and, smiling sweetly, it reveals the white teeth and calls for the delights of the kiss. The face is clear and fresh, the hand white and the hair constantly blonde. The troubadours seldom speak of the rest of the body. Peire Vidal is an exception, and his reference to the well-raised breasts may be placed beside a reference by Bertran de Born. The general impression conveyed by the love lyrics of the langue d'oc is one of great convention. There seemed to be no salvation outside certain phrases and epithets. The woman of Provence, sung by

hundreds of poets, seems to have been composed all of milk and roses, a blonde Nuremburg doll." (R. Renier, *_Il Tipo Estetico della Donna nel Medioevo_*, 1885, pp. 1-24.)

The conventional ideal of the troubadours is, again, thus described: "She is a lady whose skin is white as milk, whiter than the driven snow, of peculiar purity in whiteness. Her cheeks, on which vermilion hues alone appear, are like the rosebud in spring, when it has not yet opened to the full. Her hair, which is nearly always bedecked and adorned with flowers, is invariably of the color of flax, as soft as silk, and shimmering with a sheen of the finest gold." (J.F. Rowbotham, *_The Troubadours and Courts of Love_*, p. 228.)

In the most ancient Spanish romances, Renier remarks, the definite indications of physical beauty are slight. The hair is "of pure gold," or simply fair (*_rudios_*, which is equal to *_blondos_*, a word of later introduction), the face white and rosy, the hand soft, white, and fragrant; in one place we find a reference to the uncovered breasts, whiter than crystal. But usually the ancient Castilian romances do not deal with these details. The poet contents himself with the statement that a lady is the sweetest woman in the world, "*_la mas linda mujer del mundo_*." (R. Renier, *_Il Tipo Estetico della Donna nel Medioevo_*, pp. 68 et seq.)

In a detailed and well-documented thesis, Alwin Schultz describes the characteristics of the beautiful woman as she appealed to the German authors of the twelfth and thirteenth centuries. She must be of medium height and slender. Her hair must be fair, like gold; long, bright, and curly; a man's must only reach to his shoulders. Dark hair is seldom mentioned and was not admired. The parting of the hair must be white, but not too broad. The forehead must be white and bright and rounded, without wrinkles. The eyebrows must be darker than the hair, arched, and not too broad, as though drawn with a pencil, the space between them not too broad. The eyes must be bright, clear, and sparkling, not too large or too small; nothing definite was said of the color, but they were evidently usually blue. The nose must be of medium size, straight, and not curved. The cheeks must be white, tinged with red; if the red was absent by nature women used rouge. The mouth must be small; the lips full and red. The teeth must be

small, white, and even. The chin must be white, rounded, lovable, dimpled; the ears small and beautiful; the neck of medium size, soft, white, and spotless; the arm small; the hands and fingers long; the joints small, the nails white and bright and well cared for. The bosom must be white and large; the breasts high and rounded, like apples or pears, small and soft. The body generally must be slender and active. The lower parts of the body are very seldom mentioned, and many poets are even too modest to mention the breasts. The buttocks must be rounded, one poet, indeed, mentions, and the thighs soft and white, the meinel (mons) brown. The legs must be straight and narrow, the calves full, the feet small and narrow, with high instep. The color of the skin generally must be clear and of a tempered rosiness. (A. Schultz, Quid de Perfecta Corporis Humani Pulchritudine Germani Soeculi XII et XIII Senserint, 1866.) A somewhat similar, but shorter, account is given by K. Weinhold (Die Deutschen Frauen im Mittelalter, 1882, bd. 1, pp. 219 et seq.). Weinhold considers that, like the French, the Germans admired the mixed eye, vair or gray.

Adam de la Halle, the Artois trouvère of the thirteenth century, in a piece ("Li Jus Adan ou de la feuillie") in which he brings himself forward, thus describes his mistress: "Her hair had the brilliance of gold, and was twisted into rebellious curls. Her forehead was very regular, white, and smooth; her eyebrows, delicate and even, were two brown arches, which seemed traced with a brush. Her eyes, bright and well cut, seemed to me vairs and full of caresses; they were large beneath, and their lids like little sickles, adorned by twin folds, veiled or revealed at her will her loving gaze. Between her eyes descended the pipe of her nose, straight and beautiful, mobile when she was gay; on either side were her rounded, white cheeks, on which laughter impressed two dimples, and which one could see blushing beneath her veil. Beneath the nose opened a mouth with blossoming lips; this mouth, fresh and vermilion as a rose, revealed the white teeth, in regular array; beneath the chin sprang the white neck, descending full and round to the shoulder. The powerful nape, white and without any little wandering hairs, protruded a little over the dress. To her sloping shoulders were attached long arms, large or slender where they so should be. What shall I say of her white hands, with their long fingers, and knuckles without knots, delicately ending in rosy nails attached to the

flesh by a clear and single line? I come to her bosom with its firm breasts, but short and high pointed, revealing the valley of love between them, to her round belly, her arched flanks. Her hips were flat, her legs round, her calf large; she had a slender ankle, a lean and arched foot. Such she was as I saw her, and that which her chemise hid was not of less worth." (Houdoy, *La Beauté des Femmes*, p. 125, who quotes the original of this passage, considers it the ideal model of the mediæval woman.)

In the twelfth century story of *Aucassin et Nicolette*, "Nicolette had fair hair, delicate and curling; her eyes were gray (*vairs*) and smiling; her face admirably modeled. Her nose was high and well placed; her lips small and more vermilion than the cherry or the rose in summer; her teeth were small and white; her firm little breasts raised her dress as would two walnuts. Her figure was so slender that you could inclose it with your two hands, and the flowers of the marguerite, which her toes broke as she walked with naked feet, seemed black in comparison with her feet and legs, so white was she."

"Her hair was divided into a double tress," says Alain of Lille in the twelfth century, "which was long enough to kiss the ground; the parting, white as the lily and obliquely traced, separated the hair, and this want of symmetry, far from hurting her face, was one of the elements of her beauty. A golden comb maintained that abundant hair whose brilliance rivaled it, so that the fascinated eye could scarce distinguish the gold of the hair from the gold of the comb. The expanded forehead had the whiteness of milk, and rivaled the lily; her bright eyebrows shone like gold, not standing up in a brush, and, without being too scanty, orderly arranged. The eyes, serene and brilliant in their friendly light, seemed twin stars, her nostrils embalmed with the odor of honey, neither too depressed in shape nor too prominent, were of distinguished form; the nard of her mouth offered to the smell a treat of sweet odors, and her half-open lips invited a kiss. The teeth seemed cut in ivory; her cheeks, like the carnation of the rose, gently illuminated her face and were tempered by the transparent whiteness of her veil. Her chin, more polished than crystal, showed silver reflections, and her slender neck fitly separated her head from the shoulders. The firm rotundity of her breasts attested the full expansion of youth; her charming arms, advancing toward you, seemed to call

for caresses; the regular curve of her flanks, justly proportioned, completed her beauty. All the visible traits of her face and form thus sufficiently told what those charms must be that the bed alone knew." (The Latin text is given by Houdoy, *La Beauté des Femmes du XIIe au XVIe Siècle*, p. 119. Robert de Flagy's portrait of Blanchefleur in *Sarin-le-Loherain*, written in same century, reveals very similar traits.)

"The young woman appeared with twenty brightly polished daggers and swords," we read in the Irish *Tain Bo Cuailgne* of the Badhbh or Banshee who appeared to Meidhbh, "together with seven braids for the dead, of bright gold, in her right hand; a speckled garment of green ground, fastened by a bodkin at the breast under her fair, ruddy countenance, enveloped her form; her teeth were so new and bright that they appeared like pearls artistically set in her gums; like the ripe berry of the mountain ash were her lips; sweeter was her voice than the notes of the gentle harp-strings when touched by the most skillful fingers, and emitting the most enchanting melody; whiter than the snow of one night was her skin, and beautiful to behold were her garments, which reached to her well molded, bright-nailed feet; copious tresses of her tendriled, glossy, golden hair hung before, while others dangled behind and reached the calf of her leg." (*Ossianic Transactions*, vol. ii, p. 107.)

An ancient Irish hero is thus described: "They saw a great hero approaching them; fairest of the heroes of the world; larger and taller than any man; bluer than ice his eye; redder than the fresh rowan berries his lips; whiter than showers of pearl his teeth; fairer than the snow of one night his skin; a protecting shield with a golden border was upon him, two battle-lances in his hands; a sword with knobs of ivory [teeth of the sea-horse], and ornamented with gold, at his side; he had no other accoutrements of a hero besides these; he had golden hair on his head, and had a fair, ruddy countenance." (*The Banquet of Dun na n-gedh*, translated by O'Donovan, *Irish Archæological Society*, 1842.)

The feminine ideal of the Italian poets closely resembles that of those north of the Alps. Petrarch's Laura, as described in the *Canzoniere*, is white as snow; her eyes, indeed, are black, but the fairness of her hair is constantly emphasized; her lips are

rosy; her teeth white; her cheeks rosy; her breast youthful; her hands white and slender. Other poets insist on the tall, white, delicate body; the golden or blonde hair; the bright or starry eyes (without mention of color), the brown or black arched eyebrows, the straight nose, the small mouth, the thin vermilion lips, the small and firm breasts. (Renier, *Il Tipo Estetico*, pp. 87 et seq.)

Marie de France, a French mediæval writer of the twelfth century, who spent a large part of her life in England, in the *Lai of Lanval* thus described a beautiful woman: "Her body was beautiful, her hips low, the neck whiter than snow, the eyes gray (*vairs*), the face white, the mouth beautiful, the nose well placed, the eyebrows brown, the forehead beautiful, the head curly and blonde; the gleam of gold thread was less bright than her hair beneath the sun."

The traits of Boccaccio's ideal of feminine beauty, a voluptuous ideal as compared with the ascetic mediæval ideal which had previously prevailed, together with the characteristics of the very beautiful and almost classic garments in which he arrayed women, have been brought together by Hortis (*Studi sulle opere Latine del Boccaccio*, 1879, pp. 70 et seq.). Boccaccio admired fair and abundant wavy hair, dark and delicate eyebrows, and brown or even black eyes. It was not until some centuries later, as Hortis remarks, that Boccaccio's ideal woman was embodied by the painter in the canvases of Titian.

The first precise description of a famous beautiful woman was written by Niphus in the sixteenth century in his *De Pulchro et Amore*, which is regarded as the first modern treatise on æsthetics. The lady described is Joan of Aragon, the greatest beauty of her time, whose portrait by Raphael (or more probably Giulio Romano) is in the Louvre. Niphus, who was the philosopher of the pontifical court and the friend of Leo X, thus describes this princess, whom, as a physician, he had opportunities of observing accurately: "She is of medium stature, straight, and elegant, and possesses the grace which can only be imparted by an assemblage of characteristics which are individually faultless. She is neither fat nor bony, but succulent; her complexion is not pale, but white tinged with rose; her long hair is golden; her ears are small and in proportion with the size of her mouth. Her

brown eyebrows are semicircular, not too bushy, and the individual hairs short. Her eyes are blue (*_oæsius_*), brighter than stars, radiant with grace and gaiety beneath the dark-brown eyelashes, which are well spaced and not too long. The nose, symmetrical and of medium size, descends perpendicularly from between the eyebrows. The little valley separating the nose from the upper lip is divinely proportioned. The mouth, inclined to be rather small, is always stirred by a sweet smile; the rather thick lips are made of honey and coral. The teeth are small, polished as ivory, and symmetrically ranged, and the breath has the odor of the sweetest perfumes. Her voice is that of a goddess. The chin is divided by a dimple; the whole face approximates to a virile rotundity. The straight long neck, white and full, rises gracefully from the shoulders. On the ample bosom, revealing no indication of the bones, arise the rounded breasts, of equal and fitting size, and exhaling the perfume of the peaches they resemble. The rather plump hands, on the back like snow, on the palm like ivory, are exactly the length of the face; the full and rounded fingers are long and terminating in round, curved nails of soft color. The chest as a whole has the form of a pear, reversed, but a little compressed, and the base attached to the neck in a delightfully well-proportioned manner. The belly, the flanks, and the secret parts are worthy of the chest; the hips are large and rounded; the thighs, the legs, and the arms are in just proportion. The breadth of the shoulders is also in the most perfect relation to the dimensions of the other parts of the body; the feet, of medium length, terminate in beautifully arranged toes." (Houdoy reproduces this passage in *_La Beauté des Femmes_*; cf. also Stratz, *_Die Schönheit des Weiblichen Körpers_*, Chapter III.)

Gabriel de Minut, who published in 1587 a treatise of no very great importance, *_De la Beauté_*, also wrote under the title of *_La Paulegraphie_* a very elaborate description, covering sixty pages, of Paule de Viguier, a Gascon lady of good family and virtuous life living at Toulouse. Minut was her devoted admirer and addressed an affectionate poem to her just before his death. She was seventy years of age when he wrote the elaborate account of her beauty. She had blue eyes and fair hair, though belonging to one of the darkest parts of France.

Ploss and Bartels (*_Das Weib_*, bd. 1, sec. 3) have independently

brought together a number of passages from the writers of many countries describing their ideals of beauty. On this collection I have not drawn.

When we survey broadly the ideals of feminine beauty set down by the peoples of many lands, it is interesting to note that they all contain many features which appeal to the æsthetic taste of the modern European, and many of them, indeed, contain no features which obviously clash with his canons of taste. It may even be said that the ideals of some savages affect us more sympathetically than some of the ideals of our own mediæval ancestors. As a matter of fact, European travelers in all parts of the world have met with women who were gracious and pleasant to look on, and not seldom even in the strict sense beautiful, from the standpoint of European standards. Such individuals have been found even among those races with the greatest notoriety for ugliness.

Even among so primitive and remote a people as the Australians beauty in the European sense is sometimes found. "I have on two occasions," Lumholtz states, "seen what might be called beauties among the women of western Queensland. Their hands were small, their feet neat and well shaped, with so high an instep that one asked oneself involuntarily where in the world they had acquired this aristocratic mark of beauty. Their figure was above criticism, and their skin, as is usually the case among the young women, was as soft as velvet. When these black daughters of Eve smiled and showed their beautiful white teeth, and when their eyes peeped coquettishly from beneath the curly hair which hung in quite the modern fashion down their foreheads," Lumholtz realized that even here women could exert the influence ascribed by Goethe to women generally. (C. Lumholtz, *Among Cannibals*, p. 132.) Much has, again, been written about the beauty of the American Indians. See, e.g., an article by Dr. Shufeldt, "Beauty from an Indian's Point of View," *Cosmopolitan Magazine*, April, 1895. Among the Seminole Indians, especially, it is said that types of handsome and comely women are not uncommon. (_Clay_ MacCauley, "Seminole Indians of Florida," *Fifth Annual Report of the Bureau of Ethnology*, 1883-1884, pp. 493 et seq.)

There is much even in the negress which appeals to the European as beautiful. "I have met many negresses," remarks Castellani (_Les Femmes au Congo_, p. 2), "who could say proudly in the words of the Song of Songs, 'I am black, but comely.' Many of our

peasant women have neither the same grace nor the same delicate skin as some natives of Cassai or Songha. As to color, I have seen on the African continent creatures of pale gold or even red copper whose fine and satiny skin rivals the most delicate white skins; one may, indeed, find beauties among women of the darkest ebony." He adds that, on the whole, there is no comparison with white women, and that the negress soon becomes hideous.

The very numerous quotations from travelers concerning the women of all lands quoted by Ploss and Bartels (*Das Weib*, seventh edition, bd. i, pp. 88-106) amply suffice to show how frequently some degree of beauty is found even among the lowest human races. Cf., also, Mantegazza's survey of the women of different races from this point of view, *Fisiologia della Donna*, Cap. IV.

The fact that the modern European, whose culture may be supposed to have made him especially sensitive to æsthetic beauty, is yet able to find beauty among even the women of savage races serves to illustrate the statement already made that, whatever modifying influences may have to be admitted, beauty is to a large extent an objective matter. The existence of this objective element in beauty is confirmed by the fact that it is sometimes found that the men of the lower races admire European women more than women of their own race. There is reason to believe that it is among the more intelligent men of lower race--that is to say those whose æsthetic feelings are more developed--that the admiration for white women is most likely to be found.

"Mr. Winwood Reade," stated Darwin, "who has had ample opportunities for observation, not only with the negroes of the West Coast of Africa, but with those of the interior who have never associated with Europeans, is convinced that their ideas of beauty are, *on the whole*, the same as ours; and Dr. Rohlf's writes to me to the same effect with respect to Bornu and the countries inhabited by the Pullo tribes. Mr. Reade found that he agreed with the negroes in their estimation of the beauty of the native girls; and that their appreciation of the beauty of European women corresponded with ours.... The Fuegians, as I have been informed by a missionary who long resided with them, considered European women as extremely beautiful ... I should add that a most experienced observer, Captain [Sir R.] Burton, believes that a woman whom we consider beautiful is admired throughout the world." (Darwin, *Descent of Man*, Chapter XIX.)

Mantegazza quotes a conversation between a South American chief and an Argentine who had asked him which he preferred, the women of his own people or Christian women; the chief replied that he admired Christian women most, and when asked the reason said that they were whiter and taller, had finer hair and smoother skin. (Mantegazza, *_Fisiologia della Donna_*, Appendix to Cap. VIII.)

Nordenskjöld, as quoted by Ploss and Bartels, states that the Eskimo regard their own type as more ugly than that produced by crossing with white persons, and, according to Kropf, the Nosa Kaffers admire and seek the fairer half-castes in preference to their own women of pure race (Ploss and Bartels, *_Das Weib_*, seventh edition, bd. 1, p. 78). There is a widespread admiration for fairness, it may be added, among dark peoples. Fair men are admired by the Papuans at Torres Straits (*_Reports of the Cambridge Anthropological Expedition_*, vol. v, p. 327). The common use of powder among the women of dark-skinned peoples bears witness to the existence of the same ideal.

Stratz, in his books *_Die Schönheit des Weiblichen Körpers_* and *_Die Rassenschönheit des Weibes_*, argues that the ideal of beauty is fundamentally the same throughout the world, and that the finest persons among the lower races admire and struggle to attain the type which is found commonly and in perfection among the white peoples of Europe. When in Japan he found that among the numerous photographs of Japanese beauties everywhere to be seen, his dragoman, a Japanese of low birth, selected as the most beautiful those which displayed markedly the Japanese type with narrow-slitted eyes and broad nose. When he sought the opinion of a Japanese photographer, who called himself an artist and had some claim to be so considered, the latter selected as most beautiful three Japanese girls who in Europe also would have been considered pretty. In Java, also, when selecting from a large number of Javanese girls a few suitable for photographing, Stratz was surprised to find that a Javanese doctor pointed out as most beautiful those which most closely corresponded to the European type. (Stratz, *_Die Rassenschönheit des Weibes_*, fourth edition, 1903, p. 3; id., *_Die Körperformen der Japaner_*, 1904, p. 78.)

Stratz reproduces (*Rassenschönheit*, pp. 36 et seq.) a representation of Kwan-yin, the Chinese goddess of divine love,

and quotes some remarks of Borel's concerning the wide deviation of the representations of the goddess, a type of gracious beauty, from the Chinese racial type. Stratz further reproduces the figure of a Buddhistic goddess from Java (now in the Archæological Museum of Leyden) which represents a type of loveliness corresponding to the most refined and classic European ideal.

Not only is there a fundamentally objective element in beauty throughout the human species, but it is probably a significant fact that we may find a similar element throughout the whole animated world. The things that to man are most beautiful throughout Nature are those that are intimately associated with, or dependent upon, the sexual process and the sexual instinct. This is the case in the plant world. It is so throughout most of the animal world, and, as Professor Poulton, in referring to this often unexplained and indeed unnoticed fact, remarks, "the song or plume which excites the mating impulse in the hen is also in a high proportion of cases most pleasing to man himself. And not only this, but in their past history, so far as it has been traced (e.g., in the development of the characteristic markings of the male peacock and argus pheasant), such features have gradually become more and more pleasing to us as they have acted as stronger and stronger stimuli to the hen." [133]

FOOTNOTES:

[131] "It is likely that all visible parts of the organism, even those with a definite physiological meaning, appeal to the æsthetic sense of the opposite sex," Poulton remarks, speaking primarily of insects, in words that apply still more accurately to the human species. E. Poulton, *The Colors of Animals*, 1890, p. 304.

[132] "The Arabs in general," Lane remarks, "entertain a prejudice against blue eyes--a prejudice said to have arisen from the great number of blue-eyed persons among certain of their northern enemies."

[133] *Nature*, April 14, 1898, p. 55.

Beauty to Some Extent Consists Primitively in an Exaggeration of the Sexual Characters--The Sexual Organs--Mutilations, Adornments, and Garments--Sexual Allurement the Original Object of Such Devices--The Religious Element--Unæsthetic Character of the Sexual Organs--Importance of the Secondary Sexual Characters--The Pelvis and Hips--Steatopygia--Obesity--Gait--The Pregnant Woman as a Mediæval Type of Beauty--The Ideals of the Renaissance--The Breasts--The Corset--Its Object--Its History--Hair--The Beard--The Element of National or Racial Type in Beauty--The Relative Beauty of Blondes and Brunettes--The General European Admiration for Blondes--The Individual Factors in the Constitution of the Idea of Beauty--The Love of the Exotic.

In the constitution of our ideals of masculine and feminine beauty it was inevitable that the sexual characters should from a very early period in the history of man form an important element. From a primitive point of view a sexually desirable and attractive person is one whose sexual characters are either naturally prominent or artificially rendered so. The beautiful woman is one endowed, as Chaucer expresses it,

"With buttokes brode and brestës rounde and hye";

that is to say, she is the woman obviously best fitted to bear children and to suckle them. These two physical characters, indeed, since they represent aptitude for the two essential acts of motherhood, must necessarily tend to be regarded as beautiful among all peoples and in all stages of culture, even in high stages of civilization when more refined and perverse ideals tend to find favor, and at Pompeii as a decoration on the east side of the Purgatorium of the Temple of Isis we find a representation of Perseus rescuing Andromeda, who is shown as a woman with a very small head, small hands and feet, but with a fully developed body, large breasts, and large projecting nates.[134]

To a certain extent--and, as we shall see, to a certain extent only--the primary sexual characters are objects of admiration among primitive peoples. In the primitive dances of many peoples, often of sexual significance, the display of the sexual organs on the part of both men and women is frequently a prominent feature. Even down to mediæval times in Europe the garments of men sometimes permitted the sexual organs to be visible. In some parts of the world, also, the artificial enlargement of the female sexual organs is practised, and thus enlarged they are

considered an important and attractive feature of beauty.

Sir Andrew Smith informed Darwin that the elongated nymphæ (or "Hottentot apron") found among the women of some South African tribes was formerly greatly admired by the men (*_Descent of Man_*, Chapter XIX). This formation is probably a natural peculiarity of the women of these races which is very much exaggerated by intentional manipulation due to the admiration it arouses. The missionary Merensky reported the prevalence of the practice of artificial elongation among the Basuto and other peoples, and the anatomical evidence is in favor of its partly artificial character. (The Hottentot apron is fully discussed by Ploss and Bartels, *_Das Weib_*, bd. I, sec. vi.)

In the Jaboo country on the Bight of Benin in West Africa, Daniell stated, it was considered ornamental to elongate the labia and the clitoris artificially; small weights were appended to the clitoris and gradually increased. (W.F. Daniell, *_Topography of Gulf of Guinea_*, 1849, pp. 24, 53.)

Among the Bawenda of the northern Transvaal, the missionary Wessmann states, it is customary for young girls from the age of 8 to spend a certain amount of time every day in pulling the *_labia majora_* in order to elongate them; in selecting a wife the young men attach much importance to this elongation, and the girl whose labia stand out most is most attractive. (*_Zeitschrift für Ethnologie_*, 1894, ht. 4, p. 363.)

It may be added that in various parts of the world mutilations of the sexual organs of men and women, or operations upon them, are practiced, for reasons which are imperfectly known, since it usually happens that the people who practice them are unable to give the reason for this practice, or they assign a reason which is manifestly not that which originally prompted the practice. Thus, the excision of the clitoris, practiced in many parts of East Africa and frequently supposed to be for the sake of dulling sexual feeling (J.S. King *_Journal of the Anthropological Society_*, Bombay, 1890, p. 2), seems very doubtfully accounted for thus, for the women have it done of their own accord; "all Sobo women [Niger coast] have their clitoris cut off; unless they have this done they are looked down upon, as slave women who do not get cut; as soon, therefore, as a Sobo woman has collected

enough money, she goes to an operating woman and pays her to do the cutting." (_Journal of the Anthropological Institute_, August-November, 1898, p. 117.) The Comte de Cardi investigated this matter in the Niger Delta: "I have questioned both native men and women," he states, "to try and get the natives' reason for this rite, but the almost universal answer to my queries was, 'it is our country's fashion.'" One old man told him it was practiced because favorable to continence, and several old women said that once the women of the land used to suffer from a peculiar kind of madness which this rite reduced. (_Journal of the Anthropological Institute_, August-November, 1899, p. 59.) In the same way the subincision of the urethra (mika operation of Australia) is frequently supposed to be for the purpose of preventing conception (See, e.g., the description of the operation by J.G. Garson, _Medical Press_, February 21, 1894), but this is very doubtful, and E.C. Stirling found that subincised natives often had large families. (_Intercolonial Quarterly Journal of Medicine and Surgery_, 1894.)

A passage in the _Mainz Chronicle_ for 1367 (as quoted by Schultz, _Das Höfische Leben_, p. 297) shows that at that time the tunics of the men were so made that it was always possible for the sexual organs to be seen in walking or sitting.

This insistence on the naked sexual organs as objects of attraction is, however, comparatively rare, and confined to peoples in a low state of culture. Very much more widespread is the attempt to beautify and call attention to the sexual organs by tattooing,[135] by adornment and by striking peculiarities of clothing. The tendency for beauty of clothing to be accepted as a substitute for beauty of body appears early in the history of mankind, and, as we know, tends to be absolutely accepted in civilization.[136] "We exclaim," as Goethe remarks, "'What a beautiful little foot!' when we have merely seen a pretty shoe; we admire the lovely waist when nothing has met our eyes but an elegant girdle." Our realities and our traditional ideals are hopelessly at variance; the Greeks represented their statues without pubic hair because in real life they had adopted the oriental custom of removing the hairs; we compel our sculptors and painters to make similar representations, though they no longer correspond either to realities or to our own ideas of what is beautiful and fitting in real life. Our artists are themselves equally ignorant and confused, and, as Stratz has repeatedly shown, they constantly reproduce in all innocence the deformations and pathological characters of defective

models. If we were honest, we should say--like the little boy before a picture of the Judgment of Paris, in answer to his mother's question as to which of the three goddesses he thought most beautiful--"I can't tell, because they haven't their clothes on."

The concealment actually attained was not, however, it would appear, originally sought. Various authors have brought together evidence to show that the main primitive purpose of adornment and clothing among savages is not to conceal the body, but to draw attention to it and to render it more attractive. Westermarck, especially, brings forward numerous examples of savage adornments which serve to attract attention to the sexual regions of man and woman.[137] He further argues that the primitive object of various savage peoples in practicing circumcision, as other similar mutilations, is really to secure sexual attractiveness, whatever religious significance they may sometimes have developed subsequently. A more recent view represents the magical influence of both adornment and mutilation as primary, as a method of guarding and insulating dangerous bodily functions. Frazer, in The Golden Bough, is the most able and brilliant champion of this view, which undoubtedly embodies a large element of truth, although it must not be accepted to the absolute exclusion of the influence of sexual attractiveness. The two are largely woven in together.[138]

There is, indeed, a general tendency for the sexual functions to take on a religious character and for the sexual organs to become sacred at a very early period in culture. Generation, the reproductive force in man, animals, and plants, was realized by primitive man to be a fact of the first magnitude, and he symbolized it in the sexual organs of man and woman, which thus attained to a solemnity which was entirely independent of purposes of sexual allurements. Phallus worship may almost be said to be a universal phenomenon; it is found even among races of high culture, among the Romans of the Empire and the Japanese to-day; it has, indeed, been thought by some that one of the origins of the cross is to be found in the phallus.

"Hardly any other object," remarks Dr. Richard Andree, "has been with such great unanimity represented by nearly all peoples as the phallus, the symbol of procreative force in the religions of the East and an object of veneration at public festivals. In the Moabitic Baal Peor, in the cult of Dionysos, everywhere, indeed, except in Persia, we meet with Priapic representations and the veneration accorded to the generative organ. It is needless to

refer to the great significance of the Linga puja, the procreative organ of the god Siva, in India, a god to whom more temples were erected than to any other Indian deity. Our museums amply show how common phallic representations are in Africa, East Asia, the Pacific, frequently in connection with religious worship." (R. Andree, "Amerikansche Phallus-Darstellungen," Zeitschrift für Ethnologie, 1895, ht. 6, p. 678.)

Women have no external generative organ like the phallus to play a large part in life as a sacred symbol. There is, however, some reason to believe that the triangle is to some extent such a symbol. Lejeune ("La Representation Sexuelle en Religion, Art, et Pédagogie," Bulletin de la Société d'Anthropologie, Paris, October 3, 1901) brings forward reasons in favor of the view that the triangular hair-covered region of the mons veneris has had considerable significance in this respect, and he presents various primitive figures in illustration.

Apart from the religions and magical properties so widely accorded to the primary sexual characters, there are other reasons why they should not often have gained or long retained any great importance as objects of sexual allurements. They are unnecessary and inconvenient for this purpose. The erect attitude of man gives them here, indeed, an advantage possessed by very few animals, among whom it happens with extreme rarity that the primary sexual characters are rendered attractive to the eye of the opposite sex, though they often are to the sense of smell. The sexual regions constitute a peculiarly vulnerable spot, and remain so even in man, and the need for their protection which thus exists conflicts with the prominent display required for a sexual allurements. This end is far more effectively attained, with greater advantage and less disadvantage, by concentrating the chief ensigns of sexual attractiveness on the upper and more conspicuous parts of the body. This method is well-nigh universal among animals as well as in man.

There is another reason why the sexual organs should be discarded as objects of sexual allurements, a reason which always proves finally decisive as a people advances in culture. They are not æsthetically beautiful. It is fundamentally necessary that the intromittent organ of the male and the receptive canal of the female should retain their primitive characteristics; they cannot, therefore, be greatly modified by sexual or natural selection, and the exceedingly primitive character they are thus compelled to retain, however sexually desirable and attractive

they may become to the opposite sex under the influence of emotion, can rarely be regarded as beautiful from the point of view of æsthetic contemplation. Under the influence of art there is a tendency for the sexual organs to be diminished in size, and in no civilized country has the artist ever chosen to give an erect organ to his representations of ideal masculine beauty. It is mainly because the unæsthetic character of a woman's sexual region is almost imperceptible in any ordinary and normal position of the nude body that the feminine form is a more æsthetically beautiful object of contemplation than the masculine. Apart from this character we are probably bound, from a strictly æsthetic point of view, to regard the male form as more æsthetically beautiful.[139] The female form, moreover, usually overpasses very swiftly the period of the climax of its beauty, often only retaining it during a few weeks.

The following communication from a correspondent well brings out the divergences of feeling in this matter:

"You write that the sex organs, in an excited condition, cannot be called æsthetic. But I believe that they are a source, not only of curiosity and wonder to many persons, but also objects of admiration. I happen to know of one man, extremely intellectual and refined, who delights in lying between his mistress's thighs and gazing long at the dilated vagina. Also another man, married, and not intellectual, who always tenderly gazes at his wife's organs, in a strong light, before intercourse, and kisses her there and upon the abdomen. The wife, though amative, confessed to another woman that she could not understand the attraction. On the other hand, two married men have told me that the sight of their wives' genital parts would disgust them, and that they have never seen them.

"If the sexual parts cannot be called æsthetic, they have still a strong charm for many passionate lovers, of both sexes, though not often, I believe, among the unimaginative and the uneducated, who are apt to ridicule the organs or to be repelled by them. Many women confess that they are revolted by the sight of even a husband's complete nudity, though they have no indifference for sexual embraces. I think that the stupid bungle of Nature in making the generative organs serve as means of relieving the bladder has much to do with this revulsion. But some women of erotic temperament find pleasure in looking at the penis of a husband or lover, in handling it, and kissing it. Prostitutes do

this in the way of business; some chaste, passionate wives act thus voluntarily. This is scarcely morbid, as the mammalia of most species smell and lick each others' genitals. Probably primitive man did the same."

Brantôme (*_Vie des Dames Galantes_*, Discours II) has some remarks to much the same effect concerning the difference between men, some of whom take no pleasure in seeing the private parts of their wives or mistresses, while others admire them and delight to kiss them.

I must add that, however natural or legitimate the attraction of the sexual parts may be to either sex, the question of their purely æsthetic beauty remains unaffected.

Remy de Gourmont, in a discussion of the æsthetic element in sexual beauty, considers that the invisibility of the sexual organs is the decisive fact in rendering women more beautiful than men. "Sex, which is sometimes an advantage, is always a burden and always a flaw; it exists for the race and not for the individual. In the human male, and precisely because of his erect attitude, sex is the predominantly striking and visible fact, the point of attack in a struggle at close quarters, the point aimed at from a distance, an obstacle for the eye, whether regarded as a rugosity on the surface or as breaking the middle of a line. The harmony of the feminine body is thus geometrically much more perfect, especially when we consider the male and the female at the moment of desire when they present the most intense and natural expression of life. Then the woman, whose movements are all interior, or only visible by the undulation of her curves, preserves her full æsthetic value, while the man, as it were, all at once receding toward the primitive state of animality, seems to throw off all beauty and become reduced to the simple and naked condition of a genital organism." (Remy de Gourmont, *_Physique de l'Amour_*, p. 69.) Remy de Gourmont proceeds, however, to point out that man has his revenge after a woman has become pregnant, and that, moreover, the proportions of the masculine body are more beautiful than those of the feminine body.

The primary sexual characters of man and woman have thus never at any time played a very large part in sexual allurements. With the growth of culture,

indeed, the very methods which had been adopted to call attention to the sexual organs were by a further development retained for the purpose of concealing them. From the first the secondary sexual characters have been a far more widespread method of sexual allurements than the primary sexual characters, and in the most civilized countries to-day they still constitute the most attractive of such methods to the majority of the population.

The main secondary sexual characters in woman and the type which they present in beautiful and well-developed persons are summarized as follows by Stratz, who in his book on the beauty of the body in woman sets forth the reasons for the characteristics here given:--

- Delicate bony structure.
- Rounded forms and breasts.
- Broad pelvis.
- Long and abundant hair.
- Low and narrow boundary of pubic hair.
- Sparse hair in armpit.
- No hair on body.
- Delicate skin.
- Rounded skull.
- Small face.
- Large orbits.
- High and slender eyebrows.
- Low and small lower jaw.
- Soft transition from cheek to neck.
- Rounded neck.
- Slender wrist.
- Small hand, with long index finger.
- Rounded shoulders.
- Straight, small clavicle.
- Small and long thorax.
- Slender waist.
- Hollow sacrum.
- Prominent and domed nates.
- Sacral dimples.
- Rounded and thick thighs.
- Low and obtuse pubic arch.
- Soft contour of knee.
- Rounded calves.

Slender ankle.
Small toes.
Long second and short fifth toe.
Broad middle incisor teeth.

(Stratz, *Die Schönheit des Weiblichen Körpers*, fourteenth edition, 1903, p. 200. This statement agrees at most points with my own exposition of the secondary sexual characters: *Man and Woman*, fourth edition, revised and enlarged, 1904.)

Thus we find, among most of the peoples of Europe, Asia, and Africa, the chief continents of the world, that the large hips and buttocks of women are commonly regarded as an important feature of beauty. This secondary sexual character represents the most decided structural deviation of the feminine type from the masculine, a deviation demanded by the reproductive function of women, and in the admiration it arouses sexual selection is thus working in a line with natural selection. It cannot be said that, except in a very moderate degree, it has always been regarded as at the same time in a line with claims of purely æsthetic beauty. The European artist frequently seeks to attenuate rather than accentuate the protuberant lines of the feminine hips, and it is noteworthy that the Japanese also regard small hips as beautiful. Nearly everywhere else large hips and buttocks are regarded as a mark of beauty, and the average man is of this opinion even in the most æsthetic countries. The contrast of this exuberance with the more closely knit male form, the force of association, and the unquestionable fact that such development is the condition needed for healthy motherhood, have served as a basis for an ideal of sexual attractiveness which appeals to nearly all people more strongly than a more narrowly æsthetic ideal, which must inevitably be somewhat hermaphroditic in character.

Broad hips, which involve a large pelvis, are necessarily a characteristic of the highest human races, because the races with the largest heads must be endowed also with the largest pelvis to enable their large heads to enter the world. The white race, according to Bacarisse, has the broadest sacrum, the yellow race coming next, the black race last. The white race is also stated to show the greatest curvature of the sacrum, the yellow race next, while the black race has the flattest sacrum.[140] The black race thus possesses the least developed pelvis, the narrowest, and the flattest. It is certainly not an accidental coincidence that it is precisely among people of black race that we find a simulation of the large pelvis of the higher races admired and cultivated in the form of

steatopygia. This is an enormously exaggerated development of the subcutaneous layer of fat which normally covers the buttocks and upper parts of the thighs in woman, and in this extreme form constitutes a kind of natural fatty tumor. Steatopygia cannot be said to exist, according to Deniker, unless the projection of the buttocks exceeds 4 per cent of the individual's height; it frequently equals 10 per cent. True steatopygia only exists among Bushman and Hottentot women, and among the peoples who are by blood connected with them. An unusual development of the buttocks is, however, found among the Woloffs and many other African peoples.[141] There can be no doubt that among the black peoples of Africa generally, whether true steatopygia exists among them or not, extreme gluteal development is regarded as a very important, if not the most important, mark of beauty, and Burton stated that a Somali man was supposed to choose his wife by ranging women in a row and selecting her who projected farthest *_a tergo_*. [142] In Europe, it must be added, clothing enables this feature of beauty to be simulated. Even by some African peoples the posterior development has been made to appear still larger by the use of cushions, and in England in the sixteenth century we find the same practice well recognized, and the Elizabethan dramatists refer to the "bum-roll," which in more recent times has become the bustle, devices which bear witness to what Watts, the painter, called "the persistent tendency to suggest that the most beautiful half of humanity is furnished with tails." [143] In reality, as we see, it is simply a tendency, not to simulate an animal character, but to emphasize the most human and the most feminine of the secondary sexual characters, and therefore, from the sexual point of view, a beautiful feature. [144]

Sometimes admiration for this characteristic is associated with admiration for marked obesity generally, and it may be noted that a somewhat greater degree of fatness may also be regarded as a feminine secondary sexual character. This admiration is specially marked among several of the black peoples of Africa, and here to become a beauty a woman must, by drinking enormous quantities of milk, seek to become very fat. Sonnini noted that to some extent the same thing might be found among the Mohammedan women of Egypt. After bright eyes and a soft, polished, hairless skin, an Egyptian woman, he stated, most desired to obtain *_embonpoint_*; men admired fat women and women sought to become fat. "The idea of a very fat woman," Sonnini adds, "is nearly always accompanied in Europe by that of softness of flesh, effacement of form, and defect of elasticity in the outlines. It would be a mistake thus to represent the women of Turkey in general, where all seek to become fat. It is certain that the women of the East, more favored by Nature, preserve longer than others the firmness of the flesh,

and this precious property, joined to the freshness and whiteness of their skin, renders them very agreeable. It must be added that in no part of the world is cleanliness carried so far as by the women of the East." [145]

The special characteristics of the feminine hips and buttocks become conspicuous in walking and may be further emphasized by the special method of walking or carriage. The women of some southern countries are famous for the beauty of their way of walk; "the goddess is revealed by her walk," as Virgil said. In Spain, especially, among European countries, the walk very notably gives expression to the hips and buttocks. The spine is in Spain very curved, producing what is termed ensellure, or saddle-back--a characteristic which gives great flexibility to the back and prominence to the gluteal regions, sometimes slightly simulating steatopygia. The vibratory movement naturally produced by walking and sometimes artificially heightened thus becomes a trait of sexual beauty. Outside of Europe such vibration of the flanks and buttocks is more frankly displayed and cultivated as a sexual allurement. The Papuans are said to admire this vibratory movement of the buttocks in their women. Young girls are practiced in it by their mothers for hours at a time as soon as they have reached the age of 7 or 8, and the Papuan maiden walks thus whenever she is in the presence of men, subsiding into a simpler gait when no men are present. In some parts of tropical Africa the women walk in this fashion. It is also known to the Egyptians, and by the Arabs is called ghung. [146] As Mantegazza remarks, the essentially feminine character of this gait makes it a method of sexual allurement. It should be observed that it rests on feminine anatomical characteristics, and that the natural walk of a femininely developed woman is inevitably different from that of a man.

In an elaborate discussion of beauty of movement Stratz summarizes the special characters of the gait in woman as follows: "A woman's walk is chiefly distinguished from a man's by shorter steps, the more marked forward movement of the hips, the greater length of the phase of rest in relation to the phase of motion, and by the fact that the compensatory movements of the upper parts of the body are less powerfully supported by the action of the arms and more by the revolution of the flanks. A man's walk has a more pushing and active character, a woman's a more rolling and passive character; while a man seems to seek to catch his fleeing equilibrium, a woman seems to seek to preserve the equilibrium she has reached.... A woman's walk is beautiful when it shows the definitely feminine and rolling character, with

the greatest predominance of the moment of extension over that of flexion." (Stratz, *Die Schönheit des Weiblichen Körpers*, fourteenth edition, p. 275.)

An occasional development of the idea of sexual beauty as associated with developed hips is found in the tendency to regard the pregnant woman as the most beautiful type. Stratz observes that a woman artist once remarked to him that since motherhood is the final aim of woman, and a woman reaches her full flowering period in pregnancy, she ought to be most beautiful when pregnant. This is so, Stratz replied, if the period of her full physical bloom chances to correspond with the early months of pregnancy, for with the onset of pregnancy metabolism is heightened, the tissues become active, the tone of the skin softer and brighter, the breasts firmer, so that the charm of fullest bloom is increased until the moment when the expansion of the womb begins to destroy the harmony of the form. At one period of European culture, however,--at a moment and among a people not very sensitive to the most exquisite æsthetic sensations,--the ideal of beauty has even involved the character of advanced pregnancy. In northern Europe during the centuries immediately preceding the Renaissance the ideal of beauty, as we may see by the pictures of the time, was a pregnant woman, with protuberant abdomen and body more or less extended backward. This is notably apparent in the work of the Van Eycks: in the Eve in the Brussels Gallery; in the wife of Arnolfini in the highly finished portrait group in the National Gallery; even the virgins in the great masterpiece of the Van Eycks in the Cathedral at Ghent assume the type of the pregnant woman.

"Through all the middle ages down to Dürer and Cranach," quite truly remarks Laura Marholm (as quoted by I. Bloch, *Beiträge zur Ätiologie der Psychopathia Sexualis*, Teil I, p. 154), "we find a very peculiar type which has falsely been regarded as one of merely ascetic character. It represents quiet, peaceful, and cheerful faces, full of innocence; tall, slender, young figures; the shoulders still scanty; the breasts small, with slender legs beneath their garments; and round the upper part of the body clothing that is tight almost to the point of constriction. The waist comes just under the bosom, and from this point the broad skirts in folds give to the most feminine part of the feminine body full and absolutely unhampered power of movement and expansion. The womanly belly even in saints and virgins is very pronounced in the carriage of the body and clearly protuberant beneath the clothing. It is the maternal function, in sacred and

profane figures alike, which marks the whole type--indeed, the whole conception--of woman." For a brief period this fashion reappeared in the eighteenth century, and women wore pads and other devices to increase the size of the abdomen.

With the Renaissance this ideal of beauty disappeared from art. But in real life we still seem to trace its survival in the fashion for that class of garments which involved an immense amount of expansion below the waist and secured such expansion by the use of whalebone hoops and similar devices. The Elizabethan farthingale was such a garment. This was originally a Spanish invention, as indicated by the name (from *_verdugardo_*, provided with hoops), and reached England through France. We find the fashion at its most extreme point in the fashionable dress of Spain in the seventeenth century, such as it has been immortalized by Velasquez. In England hoops died out during the reign of George III but were revived for a time, half a century later, in the Victorian crinoline.[147]

Only second to the pelvis and its integuments as a secondary sexual character in woman we must place the breasts.[148] Among barbarous and civilized peoples the beauty of the breast is usually highly esteemed. Among Europeans, indeed, the importance of this region is so highly esteemed that the general rule against the exposure of the body is in its favor abrogated, and the breasts are the only portion of the body, in the narrow sense, which a European lady in full dress is allowed more or less to uncover. Moreover, at various periods and notably in the eighteenth century, women naturally deficient in this respect have sometimes worn artificial busts made of wax. Savages, also, sometimes show admiration for this part of the body, and in the Papuan folk-tales, for instance, the sole distinguishing mark of a beautiful woman is breasts that stand up.[149] On the other hand, various savage peoples even appear to regard the development of the breasts as ugly and adopt devices for flattening this part of the body.[150] The feeling that prompts this practice is not unknown in modern Europe, for the Bulgarians are said to regard developed breasts as ugly; in mediæval Europe, indeed, the general ideal of feminine slenderness was opposed to developed breasts, and the garments tended to compress them. But in a very high degree of civilization this feeling is unknown, as, indeed, it is unknown to most barbarians, and the beauty of a woman's breasts, and of any natural or artificial object which suggests the gracious curves of the bosom, is a universal source of pleasure.

The casual vision of a girl's breasts may, in the chastest youth,

evoke a strange perturbation. (Cf., e.g., a passage in an early chapter of Marcelle Tinayre's *La Maison du Péché*.) We need not regard this feeling as of purely sexual origin; and in addition even to the æsthetic element it is probably founded to some extent on a reminiscence of the earliest associations of life. This element of early association was very well set forth long ago by Erasmus Darwin:--

"When the babe, soon after it is born into this cold world, is applied to its mother's bosom, its sense of perceiving warmth is first agreeably affected; next its sense of smell is delighted with the odor of her milk; then its taste is gratified by the flavor of it; afterward the appetites of hunger and of thirst afford pleasure by the possession of their object, and by the subsequent digestion of the aliment; and, last, the sense of touch is delighted by the softness and smoothness of the milky fountain, the source of such variety of happiness.

"All these various kinds of pleasure at length become associated with the form of the mother's breast, which the infant embraces with its hands, presses with its lips, and watches with its eyes; and thus acquires more accurate ideas of the form of its mother's bosom than of the odor, flavor, and warmth which it perceives by its other senses. And hence at our maturer years, when any object of vision is presented to us which by its wavy or spiral lines bears any similitude to the form of the female bosom, whether it be found in a landscape with soft gradations of raising and descending surface, or in the forms of some antique vases, or in other works of the pencil or the chisel, we feel a general glow of delight which seems to influence all our senses; and if the object be not too large we experience an attraction to embrace it with our lips as we did in our early infancy the bosom of our mothers." (E. Darwin, *Zoönomia*, 1800, vol. i, p. 174.)

The general admiration accorded to developed breasts and a developed pelvis is evidenced by a practice which, as embodied in the corset, is all but universal in many European countries, as well as the extra-European countries inhabited by the white race, and in one form or another is by no means unknown to peoples of other than the white race.

The tightening of the waist girth was little known to the Greeks of the best period, but it was practiced by the Greeks of the decadence and by

them transmitted to the Romans; there are many references in Latin literature to this practice, and the ancient physician wrote against it in the same sense as modern doctors. So far as Christian Europe is concerned it would appear that the corset arose to gratify an ideal of asceticism rather than of sexual allurements. The bodice in early mediæval days bound and compressed the breasts and thus tended to efface the specifically feminine character of a woman's body. Gradually, however, the bodice was displaced downward, and its effect, ultimately, was to render the breasts more prominent instead of effacing them. Not only does the corset render the breasts more prominent; it has the further effect of displacing the breathing activity of the lungs in an upward direction, the advantage from the point of sexual allurements thus gained being that additional attention is drawn to the bosom from the respiratory movement thus imparted to it. So marked and so constant is this artificial respiratory effect, under the influence of the waist compression habitual among civilized women, that until recent years it was commonly supposed that there is a real and fundamental difference in breathing between men and women, that women's breathing is thoracic and men's abdominal. It is now known that under natural and healthy conditions there is no such difference, but that men and women breathe in a precisely identical manner. The corset may thus be regarded as the chief instrument of sexual allurements which the armory of costume supplies to a woman, for it furnishes her with a method of heightening at once her two chief sexual secondary characters, the bosom above, the hips and buttocks below. We cannot be surprised that all the scientific evidence in the world of the evil of the corset is powerless not merely to cause its abolition, but even to secure the general adoption of its comparatively harmless modifications.

Several books have been written on the history of the corset. Léoty (*Le Corset à travers les Ages*, 1893) accepts Bouvier's division of the phases through which the corset has passed: (1) the bands, or fasciæ, of Greek and Roman ladies; (2) period of transition during greater part of middle ages, classic traditions still subsisting; (3) end of middle ages and beginning of Renaissance, when tight bodices were worn; (4) the period of whalebone bodices, from middle of sixteenth to end of eighteenth centuries; (5) the period of the modern corset. We hear of embroidered girdles in Homer. Even in Rome, however, the fasciæ were not in general use, and were chiefly employed either to support the breasts or to compress their excessive development, and then called *mamillare*. The *zona* was a girdle, worn usually round the hips, especially by young girls. The modern

corset is a combination of the fascia and the zona. It was at the end of the fourteenth century that Isabeau of Bavaria introduced the custom of showing the breasts uncovered, and the word "corset" was then used for the first time.

Stratz, in his Frauenkleidung (pp. 366 et seq.), and in his Schönheit des Weiblichen Körpers, Chapters VIII, X, and XVI, also deals with the corset, and illustrates the results of compression on the body. For a summary of the evidence concerning the difference of respiration in man and woman, its causes and results, see Havelock Ellis, Man and Woman, fourth edition, 1904, pp. 228-244. With reference to the probable influence of the corset and unsuitable clothing generally during early life in impeding the development of the mammary glands, causing inability to suckle properly, and thus increasing infant mortality, see especially a paper by Professor Bollinger (Correspondenz-blatt Deutsch. Gesell. Anthropologie, October, 1899).

The compression caused by the corset, it must be added, is not usually realized or known by those who wear it. Thus, Rushton Parker and Hugh Smith found, in two independent series of measurements, that the waist measurement was, on the average, two inches less over the corset than round the naked waist; "the great majority seemed quite unaware of the fact." In one case the difference was as much as five inches. (British Medical Journal, September 15 and 22, 1900.)

The breasts and the developed hips are characteristics of women and are indications of functional effectiveness as well as sexual allurements. Another prominent sexual character which belongs to man, and is not obviously an index of function, is furnished by the hair on the face. The beard may be regarded as purely a sexual adornment, and thus comparable to the somewhat similar growth on the heads of many male animals. From this point of view its history is interesting, for it illustrates the tendency with increase of civilization not merely to dispense with sexual allurements in the primary sexual organs, but even to disregard those growths which would appear to have been developed solely to act as sexual allurements. The cultivation of the beard belongs peculiarly to barbarous races. Among these races it is frequently regarded as the most sacred and beautiful part of the person, as an object to swear by, an object to which the slightest insult must be treated as deadly. Holding such a position, it must doubtless act as a sexual allurements. "Allah has specially created

an angel in Heaven," it is said in the *_Arabian Nights_*, "who has no other occupation than to sing the praises of the Creator for giving a beard to men and long hair to women." The sexual character of the beard and the other hirsute appendage is significantly indicated by the fact that the ascetic spirit in Christianity has always sought to minimize or to hide the hair. Altogether apart, however, from this religious influence, civilization tends to be opposed to the growth of hair on the masculine face and especially to the beard. It is part of the well-marked tendency with civilization to the abolition of sexual differences. We find this general tendency among the Greeks and Romans, and, on the whole, with certain variations and fluctuations of fashion, in modern Europe also. Schopenhauer frequently referred to this disappearance of the beard as a mark of civilization, "a barometer of culture." [151] The absence of facial hair heightens æsthetic beauty of form, and is not felt to remove any substantial sexual attraction.

That even the Egyptians regarded the beard as a mark of beauty and an object of veneration is shown by the fact that the priests wore it long and cut it off in grief (Herodotus, *_Euterpe_*, Chapter XXXVI). The respect with which the beard was regarded among the ancient Hebrews is indicated in the narrative (II Samuel, Chapter X) which tells how, when David sent his servants to King Hanun the latter shaved off half their beards; they were too ashamed to return in this condition, and remained at Jericho until their beards had grown again. A passage in Ordericus Vitalis (*_Ecclesiastical History_*, Book VIII, Chapter X) is interesting both as regards the fashions of the twelfth century in England and Normandy and the feeling that prompted Ordericus. Speaking of the men of his time, he wrote: "The forepart of their head is bare after the manner of thieves, while at the back they nourish long hair like harlots. In former times penitents, captives and pilgrims usually went unshaved and wore long beards, as an outward mark of their penance or captivity or pilgrimage. Now almost all the world wear crisped hair and beards, carrying on their faces the token of their filthy lust like stinking goats. Their locks are curled with hot irons, and instead of wearing caps they bind their heads with fillets. A knight seldom appears in public with his head uncovered, and properly shaved, according to the apostolic precept (I Corinthians, Chapter XI, verses 7 and 14)."

We have seen that there is good reason for assuming a certain fundamental

tendency whereby the most various peoples of the world, at all events in the person of their most intelligent members, recognize and accept a common ideal of feminine beauty, so that to a certain extent beauty may be said to have an objectively æsthetic basis. We have further found that this æsthetic human ideal is modified, and very variously modified in different countries and even in the same country at different periods, by a tendency, prompted by a sexual impulse which is not necessarily in harmony with æsthetic canons, to emphasize, or even to repress, one or other of the prominent secondary sexual characters of the body. We now come to another tendency which is apt to an even greater extent to limit the cultivation of the purely æsthetic ideal of beauty: the influences of national or racial type.

To the average man of every race the woman who most completely embodies the type of his race is usually the most beautiful, and even mutilations and deformities often have their origin, as Humboldt long since pointed out, in the effort to accentuate the racial type.[152] Eastern women possess by nature large and conspicuous eyes, and this characteristic they seek still further to heighten by art. The Ainu are the hairiest of races, and there is nothing which they consider so beautiful as hair. It is difficult to be sexually attracted to persons who are fundamentally unlike ourselves in racial constitution.[153]

It frequently happens that this admiration for racial characteristics leads to the idealization of features which are far removed from æsthetic beauty. The firm and rounded breast is certainly a feature of beauty, but among many of the black peoples of Africa the breasts fall at a very early period, and here we sometimes find that the hanging breast is admired as beautiful.

The African Baganda, the Rev. J. Roscoe states (_Journal of the Anthropological Institute_, January-June, 1902, p. 72), admire hanging breasts to such an extent that their young women tie them down in order to hasten the arrival of this condition.

"The most remarkable trait of beauty in the East," wrote Sonnini, "is to have large black eyes, and nature has made this a characteristic sign of the women of these countries. But, not content with this, the women of Egypt wish their eyes to be still larger and blacker. To attain this Mussulmans, Jewesses, and Christians, rich and poor, all tint their eyelids with galena. They also blacken the lashes (as Juvenal tells us the Roman

ladies did) and mark the angles of the eye so that the fissure appears larger." (Sonnini, *_Voyage dans la Haute et Basse Egypte_*, 1799, vol. i, p. 290.) Kohl is thus only used by the women who have what the Arabs call "natural kohl." As Flinders Petrie has found, the women of the so-called "New Race," between the sixth and tenth dynasties of ancient Egypt, used galena and malachite for painting their faces. Jewish women in the days of the prophets painted their eyes with kohl, as do some Hindu women to-day.

"The Ainu have a great affection for their beards. They regard them as a sign of manhood and strength and consider them as especially handsome. They look upon them, indeed, as a great and highly prized treasure." (J. Batchelor, *_The Ainu and their Folklore_*, p. 162.)

A great many theories have been put forward to explain the Chinese fashion of compressing and deforming the foot. The Chinese are great admirers of the feminine foot, and show extreme sexual sensitiveness in regard to it. Chinese women naturally possess very small feet, and the main reason for binding them is probably to be found in the desire to make them still smaller. (See, e.g., Stratz, *_Die Frauenkleidung_*, 1904, p. 101.)

An interesting question, which in part finds its explanation here and is of considerable significance from the point of view of sexual selection, concerns the relative admiration bestowed on blondes and brunettes. The question is not, indeed, one which is entirely settled by racial characteristics. There is something to be said on the matter from the objective standpoint of æsthetic considerations. Stratz, in a chapter on beauty of coloring in woman, points out that fair hair is more beautiful because it harmonizes better with the soft outlines of woman, and, one may add, it is more brilliantly conspicuous; a golden object looks larger than a black object. The hair of the armpit, also, Stratz considers should be light. On the other hand, the pubic hair should be dark in order to emphasize the breadth of the pelvis and the obtuseness of the angle between the mons veneris and the thighs. The eyebrows and eyelashes should also be dark in order to increase the apparent size of the orbits. Stratz adds that among many thousand women he has only seen one who, together with an otherwise perfect form, has also possessed these excellencies in the highest measure. With an equable and matt complexion she had blonde, very

long, smooth hair, with sparse, blonde, and curly axillary hair; but, although her eyes were blue, the eyebrows and eyelashes were black, as also was the not overdeveloped pubic hair.[154]

We may accept it as fairly certain that, so far as any objective standard of æsthetic beauty is recognizable, that standard involves the supremacy of the fair type of woman. Such supremacy in beauty has doubtless been further supported by the fact that in most European countries the ruling caste, the aristocratic class, whose superior energy has brought it to the top, is somewhat blonder than the average population.

The main cause, however, in determining the relative amount of admiration accorded in Europe to blondes and to brunettes is the fact that the population of Europe must be regarded as predominantly fair, and that our conception of beauty in feminine coloring is influenced by an instinctive desire to seek this type in its finest forms. In the north of Europe there can, of course, be no question concerning the predominant fairness of the population, but in portions of the centre and especially in the south it may be considered a question. It must, however, be remembered that the white population occupying all the shores of the Mediterranean have the black peoples of Africa immediately to the south of them. They have been liable to come in contact with the black peoples and in contrast with them they have tended not only to be more impressed with their own whiteness, but to appraise still more highly its blondest manifestations as representing a type the farthest removed from the negro. It must be added that the northerner who comes into the south is apt to overestimate the darkness of the southerner because of the extreme fairness of his own people. The differences are, however, less extreme than we are apt to suppose; there are more dark people in the north than we commonly assume, and more fair people in the south. Thus, if we take Italy, we find in its fairest part, Venetia, according to Raseri, that there are 8 per cent. communes in which fair hair predominates, 81 per cent. in which brown predominates, and only 11 per cent. in which black predominates; as we go farther south black hair becomes more prevalent, but there are in most provinces a few communes in which fair hair is not only frequent, but even predominant. It is somewhat the same with light eyes, which are also most abundant in Venetia and decrease to a slighter extent as we go south. It is possible that in former days the blondes prevailed to a greater degree than to-day in the south of Europe. Among the Berbers of the Atlas Mountains, who are probably allied to the South Europeans, there appears to be a fairly considerable proportion of blondes,[155] while on the other hand there is some reason to believe that blondes die out under the

influence of civilization as well as of a hot climate.

However this may be, the European admiration for blondes dates back to early classic times. Gods and men in Homer would appear to be frequently described as fair.[156] Venus is nearly always blonde, as was Milton's Eve. Lucian refers to women who dye their hair. The Greek sculptors gilded the hair of their statues, and the figurines in many cases show very fair hair.[157] The Roman custom of dyeing the hair light, as Renier has shown, was not due to the desire to be like the fair Germans, and when Rome fell it would appear that the custom of dyeing the hair persisted, and never died out; it is mentioned by Anselm, who died at the beginning of the twelfth century.[158]

In the poetry of the people in Italy brunettes, as we should expect, receive much commendation, though even here the blondes are preferred. When we turn to the painters and poets of Italy, and the æsthetic writers on beauty from the Renaissance onward, the admiration for fair hair is unqualified, though there is no correspondingly unanimous admiration for blue eyes. Angelico and most of the pre-Raphaelite artists usually painted their women with flaxen and light-golden hair, which often became brown with the artists of the Renaissance period. Firenzuola, in his admirable dialogue on feminine beauty, says that a woman's hair should be like gold or honey or the rays of the sun. Luigini also, in his *Libro della bella Donna*, says that hair must be golden. So also thought Petrarch and Ariosto. There is, however, no corresponding predilection among these writers for blue eyes. Firenzuola said that the eyes must be dark, though not black. Luigini said that they must be bright and black. Niphus had previously said that the eyes should be "black like those of Venus" and the skin ivory, even a little brown. He mentions that Avicenna had praised the mixed, or gray eye.

In France and other northern countries the admiration for very fair hair is just as marked as in Italy, and dates back to the earliest ages of which we have a record. "Even before the thirteenth century," remarks Houdoy, in his very interesting study of feminine beauty in northern France during mediæval times, "and for men as well as for women, fair hair was an essential condition of beauty; gold is the term of comparison almost exclusively used." [159] He mentions that in the *Acta Sanctorum* it is stated that Saint Godelive of Bruges, though otherwise beautiful, had black hair and eyebrows and was hence contemptuously called a crow. In the *Chanson de Roland* and all the French mediæval poems the eyes are invariably *vairs*. This epithet is somewhat vague. It comes from

varius, and signifies mixed, which Houdoy regards as showing various irradiations, the same quality which later gave rise to the term _iris_ to describe the pupillary membrane.[160] _Vair_ would thus describe not so much the color of the eye as its brilliant and sparkling quality. While Houdoy may have been correct, it still seems probable that the eye described as _vair_ was usually assumed to be "various" in color also, of the kind we commonly call gray, which is usually applied to blue eyes encircled with a ring of faintly sprinkled brown pigment. Such eyes are fairly typical of northern France and frequently beautiful. That this was the case seems to be clearly indicated by the fact that, as Houdoy himself points out, a few centuries later the _vair_ eye was regarded as _vert_, and green eyes were celebrated as the most beautiful.[161] The etymology was false, but a false etymology will hardly suffice to change an ideal. At the Renaissance Jehan Lemaire, when describing Venus as the type of beauty, speaks of her green eyes, and Ronsard, a little later, sang:

"Noir je veux l'oeil et brun le teint,
Bien que l'oeil verd toute la France adore."

Early in the sixteenth century Brantôme quotes some lines current in France, Spain, and Italy according to which a woman should have a white skin, but black eyes and eyebrows, and adds that personally he agrees with the Spaniard that "a brunette is sometimes equal to a blonde,"[162] but there is also a marked admiration for green eyes in Spanish literature; not only in the typical description of a Spanish beauty in the _Celestina_ (Act. I) are the eyes green, but Cervantes, for example, when referring to the beautiful eyes of a woman, frequently speaks of them as green.

It would thus appear that in Continental Europe generally, from south to north, there is a fair uniformity of opinion as regards the pigmentary type of feminine beauty. Such variation as exists seemingly involves a somewhat greater degree of darkness for the southern beauty in harmony with the greater racial darkness of the southerner, but the variations fluctuate within a narrow range; the extremely dark type is always excluded, and so it would seem probable is the extremely fair type, for blue eyes have not, on the whole, been considered to form part of the admired type.

If we turn to England no serious modification of this conclusion is called for. Beauty is still fair. Indeed, the very word "fair" in England itself means beautiful. That in the seventeenth century it was generally held essential that beauty should be blonde is indicated by a passage in the

Anatomy of Melancholy, where Burton argues that "golden hair was ever in great account," and quotes many examples from classic and more modern literature.[163] That this remains the case is sufficiently evidenced by the fact that the ballet and chorus on the English stage wear yellow wigs, and the heroine of the stage is blonde, while the female villain of melodrama is a brunette.

While, however, this admiration of fairness as a mark of beauty unquestionably prevails in England, I do not think it can be said--as it probably can be said of the neighboring and closely allied country of France--that the most beautiful women belong to the fairest group of the community. In most parts of Europe the coarse and unbeautiful plebeian type tends to be very dark; in England it tends to be very fair. England is, however, somewhat fairer generally than most parts of Europe; so that, while it may be said that a very beautiful woman in France or in Spain may belong to the blondest section of the community, a very beautiful woman in England, even though of the same degree of blondness as her Continental sister, will not belong to the extremely blonde section of the English community. It thus comes about that when we are in northern France we find that gray eyes, a very fair but yet unfreckled complexion, brown hair, finely molded features, and highly sensitive facial expression combine to constitute a type which is more beautiful than any other we meet in France, and it belongs to the fairest section of the French population. When we cross over to England, however, unless we go to a so-called "Celtic" district, it is hopeless to seek among the blondest section of the community for any such beautiful and refined type. The English beautiful woman, though she may still be fair, is by no means very fair, and from the English standpoint she may even sometimes appear somewhat dark:[164] In determining what I call the index of pigmentation--or degree of darkness of the eyes and hair--of different groups in the National Portrait Gallery I found that the "famous beauties" (my own personal criterion of beauty not being taken into account) was somewhat nearer to the dark than to the light end of the scale.[165] If we consider, at random, individual instances of famous English beauties they are not extremely fair. Lady Venetia Stanley, in the early seventeenth century, who became the wife of Sir Kenelm Digby, was somewhat dark, with brown hair and eyebrows. Mrs. Overall, a little later in the same century, a Lancashire woman, the wife of the Dean of St. Paul's, was, says Aubrey, "the greatest beauty in her time in England," though very wanton, with "the loveliest eyes that were ever seen"; if we may trust a ballad given by Aubrey she was dark with black hair. The Gummings, the famous beauties of the eighteenth century, were not extremely fair, and Lady Hamilton, the

most characteristic type of English beauty, had blue, brown-flecked eyes and dark chestnut hair. Coloration is only one of the elements of beauty, though an important one. Other things being equal, the most blonde is most beautiful; but it so happens that among the races of Great Britain the other things are very frequently not equal, and that, notwithstanding a conviction ingrained in the language, with us the fairest of women is not always the "fairest." So magical, however, is the effect of brilliant coloring that it serves to keep alive in popular opinion an unqualified belief in the universal European creed of the beauty of blondness.

We have seen that underlying the conception of beauty, more especially as it manifests itself in woman to man, are to be found at least three fundamental elements: First there is the general beauty of the species as it tends to culminate in the white peoples of European origin; then there is the beauty due to the full development or even exaggeration of the sexual and more especially the secondary sexual characters; and last there is the beauty due to the complete embodiment of the particular racial or national type. To make the analysis fairly complete must be added at least one other factor: the influence of individual taste. Every individual, at all events in civilization, within certain narrow limits, builds up a feminine ideal of his own, in part on the basis of his own special organization and its demands, in part on the actual accidental attractions he has experienced. It is unnecessary to emphasize the existence of this factor, which has always to be taken into account in every consideration of sexual selection in civilized man. But its variations are numerous and in impassioned lovers it may even lead to the idealization of features which are in reality the reverse of beautiful. It may be said of many a man, as d'Annunzio says of the hero of his *Trionfo della Morte* in relation to the woman he loved, that "he felt himself bound to her by the real qualities of her body, and not only by those which were most beautiful, but specially by *those which were least beautiful*" (the novelist italicizes these words), so that his attention was fixed upon her defects, and emphasized them, thus arousing within himself an impetuous state of desire. Without invoking defects, however, there are endless personal variations which may all be said to come within the limits of possible beauty or charm. "There are no two women," as Stratz remarks, "who in exactly the same way stroke back a rebellious lock from their brows, no two who hold the hand in greeting in exactly the same way, no two who gather up their skirts as they walk with exactly the same movement." [166] Among the multitude of minute differences--which yet can be seen and felt--the beholder is variously attracted or repelled according to his own individual idiosyncrasy, and the operations of sexual

selection are effected accordingly.

Another factor in the constitution of the ideal of beauty, but one perhaps exclusively found under civilized conditions, is the love of the unusual, the remote, the exotic. It is commonly stated that rarity is admired in beauty. This is not strictly true, except as regards combinations and characters which vary only in a very slight degree from the generally admired type. "*Jucundum nihil est quod non reficit variatas*," according to the saying of Publilius Syrus. The greater nervous restlessness and sensibility of civilization heightens this tendency, which is not infrequently found also among men of artistic genius. One may refer, for instance, to Baudelaire's profound admiration for the mulatto type of beauty.[167] In every great centre of civilization the national ideal of beauty tends to be somewhat modified in exotic directions, and foreign ideals, as well as foreign fashions, become preferred to those that are native. It is significant of this tendency that when, a few years since, an enterprising Parisian journal hung in its *salle* the portraits of one hundred and thirty-one actresses, etc., and invited the votes of the public by ballot as to the most beautiful of them, not one of the three women who came out at the head of the poll was French. A dancer of Belgian origin (Cléo de Merode) was by far at the head with over 3000 votes, followed by an American from San Francisco (Sybil Sanderson), and then a Polish woman.

FOOTNOTES:

[134] Figured in Mau's *Pompeii*, p. 174.

[135] As a native of Lukunor said to the traveler Mertens, "It has the same object as your clothes, to please the women."

[136] "The greatest provocations of lust are from our apparel," as Burton states (*Anatomy of Melancholy*, Part III, Sec. II, Mem. II, Subs. III), illustrating this proposition with immense learning. Stanley Hall (*American Journal of Psychology*, vol. ix, Part III, pp. 365 *et seq.*) has some interesting observations on the various psychic influences of clothing; cf. Bloch, *Beiträge zur Ätiologie der Psychopathia Sexualis*, Teil II, pp. 330 *et seq.*

[137] *History of Human Marriage*, Chapter IX, especially p. 201. We have a striking and comparatively modern European example of an article of

clothing designed to draw attention to the sexual sphere in the codpiece (the French *_braguette_*), familiar to us through fifteenth and sixteenth century pictures and numerous allusions in Rabelais and in Elizabethan literature. This was originally a metal box for the protection of the sexual organs in war, but subsequently gave place to a leather case only worn by the lower classes, and became finally an elegant article of fashionable apparel, often made of silk and adorned with ribbons, even with gold and jewels. (See, e.g., Bloch, *_Beiträge zur Ätiologie der Psychopathia Sexualis_*, Teil I, p. 159.)

[138] A correspondent in Ceylon has pointed out to me that in the Indian statues of Buddha, Vishnu, goddesses, etc., the necklace always covers the nipples, a sexually attractive adornment being thus at the same time the guardian of the orifices of the body. Crawley (*_The Mystic Rose_*, p. 135) regards mutilations as in the nature of permanent amulets or charms.

[139] Mantegazza, in his discussion of this point, although an ardent admirer of feminine beauty, decides that woman's form is not, on the whole, more beautiful than man's. See Appendix to Cap. IV of *_Fisiologia della Donna_*.

[140] For a discussion of the anthropology of the feminine pelvis, see Ploss and Bartels, *_Das Weib_*, bd. 1. Sec. VI.

[142] Darwin.

[143] G.F. Watts, "On Taste in Dress," *_Nineteenth Century_*, 1883.

[144] From mediæval times onwards there has been a tendency to treat the gluteal region with contempt, a tendency well marked in speech and custom among the lowest classes in Europe to-day, but not easily traceable in classic times. Dühren (*_Das Geschlechtsleben in England_*, bd. II, pp. 359 et seq.) brings forward quotations from æsthetic writers and others dealing with the beauty of this part of the body.

[145] Sonnini, *_Voyage, etc._*, vol. i, p. 308.

[146] Ploss and Bartels, *_Das Weib_*, bd. 1, Sec. III; Mantegazza, *_Fisiologia della Donna_*, Chapter III.

[147] Bloch brings together various interesting quotations concerning the farthingale and the crinoline. (*Beiträge zur Ätiologie der Psychopathia Sexualis*, Teil I, p. 156.) He states that, like most other feminine fashions in dress, it was certainly invented by prostitutes.

[148] The racial variations in the form and character of the breasts are great, and there are considerable variations even among Europeans. Even as regards the latter our knowledge is, however, still very vague and incomplete; there is here a fruitful field for the medical anthropologist. Ploss and Bartels have brought together the existing data (*Das Weib*, bd. I, Sec. VIII). Stratz also discusses the subject (*Die Schönheit des Weiblichen Körpers*, Chapter X).

[149] *Cambridge Anthropological Expedition to Torres Straits*, vol. v, p. 28.

[150] These devices are dealt with and illustrations given by Ploss and Bartels, *Das Weib* (loc. cit.).

[151] See, e.g., *Parerga und Paralipomena*, bd. I, p. 189, and bd. 2, p. 482. Moll has also discussed this point (*Untersuchungen über die Libido Sexualis*, bd. I, pp. 384 et seq.).

[152] Speaking of some South American tribes, he remarks (*Travels*, English translations, 1814, vol. iii. p. 236) that they "have as great an antipathy to the beard as the Eastern nations hold it in reverence. This antipathy is derived from the same source as the predilection for flat foreheads, which is seen in so singular a manner in the statues of the Aztec heroes and divinities. Nations attach the idea of beauty to everything which particularly characterizes their own physical conformation, their natural physiognomy." See also Westermarck, *History of Marriage*, p. 261. Ripley (*Races of Europe*, pp. 49, 202) attaches much importance to the sexual selection founded on a tendency of this kind.

[153] "Differences of race are irreducible," Abel Hermant remarks (*Confession d'un Enfant d'Hier*, p. 209), "and between two beings who love each other they cannot fail to produce exceptional and instructive reactions. In the first superficial ebullition of love, indeed, nothing notable may be manifested, but in a fairly short time the two lovers, innately hostile, in striving to approach each other strike against an

invisible partition which separates them. Their sensibilities are divergent; everything in each shocks the other; even their anatomical conformation, even the language of their gestures; all is foreign."

[154] C.H. Stratz, *Die Schönheit des Weiblichen Körpers*, fourteenth edition, Chapter XII.

[155] See, e.g., Sergi, *The Mediterranean Race*, pp. 59-75.

[156] Sergi (*The Mediterranean Race*, Chapter 1), by an analysis of Homer's color epithets, argues that in very few cases do they involve fairness; but his attempt scarcely seems successful, although most of these epithets are undoubtedly vague and involve a certain range of possible color.

[157] Léchat's study of the numerous realistic colored statues recently discovered in Greece (summarized in *Zentralblatt für Anthropologie*, 1904, ht. 1, p. 22) shows that with few exceptions the hair is fair.

[158] Renier, *Il Tipo Estetico*, pp. 127 et seq. In another book, *Les Femmes Blondes selon les Peintres de l'Ecole de Venise*, par deux Venitiens (one of these "Venetians" being Armand Baschet), is brought together much information concerning the preference for blondes in literature, together with a great many of the recipes anciently used for making the hair fair.

[159] J. Houdoy, *La Beauté des Femmes dans la Littérature et dans l'Art du XIIe au XVIIe Siècle*, 1876, pp. 32 et seq.

[162] Brantôme, *Vie des Dames Galantes*, Discours II.

[163] *Anatomy of Melancholy*, Part III, Sec. II, Mem. II, Subs. II.

[164] It is significant that Burton (*Anatomy of Melancholy*, loc. cit.), while praising golden hair, also argues that "of all eyes black are moist amiable," quoting many examples to this effect from classic and later literature.

[165] "Relative Abilities of the Fair and the Dark," *Monthly Review*, August, 1901; cf. H. Ellis, *A Study of British Genius*, p. 215.

[166] Stratz, *Die Schönheit des Weiblichen Körpers*, p. 217.

[167] Bloch (*Beiträge zur Ätiologie der Psychopathia Sexualis*, Teil II, pp. 261 et seq.) brings together some facts bearing on the admiration for negresses in Paris and elsewhere.

III.

Beauty not the Sole Element in the Sexual Appeal of Vision--Movement--The Mirror--Narcissism--Pygmalionism--Mixoscopy--The Indifference of Women to Male Beauty--The Significance of Woman's Admiration of Strength--The Spectacle of Strength is a Tactile Quality made Visible.

Our discussion of the sensory element of vision in human sexual selection has been mainly an attempt to disentangle the chief elements of beauty in so far as beauty is a stimulus to the sexual instinct. Beauty by no means comprehends the whole of the influences which make for sexual allurement through vision, but it is the point at which all the most powerful and subtle of these are focussed; it represents a fairly definite complexus, appealing at once to the sexual and to the æsthetic impulses, to which no other sense can furnish anything in any degree analogous. It is because this conception of beauty has arisen upon it that vision properly occupies the supreme position in man from the point of view which we here occupy.

Beauty is thus the chief, but it is not the sole, element in the sexual appeal of vision. In all parts of the world this has always been well understood, and in courtship, in the effort to arouse tumescence, the appeals to vision have been multiplied and at the same time aided by appeals to the other senses. Movement, especially in the form of dancing, is the most important of the secondary appeals to vision. This is so well recognized that it is scarcely necessary to insist upon it here; it may suffice to refer to a single typical example. The most decent of Polynesian dances, according to William Ellis, was the *hura*, which was danced by the daughters of chiefs in the presence of young men of rank with the hope of gaining a future husband. "The daughters of the chiefs,

who were the dancers on these occasions, at times amounted to five or six, though occasionally only one exhibited her symmetry of figure and gracefulness of action. Their dress was singular, but elegant. The head was ornamented with a fine and beautiful braid of human hair, wound round the head in the form of a turban. A triple wreath of scarlet, white, and yellow flowers adorned the head-dress. A loose vest of spotted cloth covered the lower part of the bosom. The tihi, of fine white stiffened cloth frequently edged with a scarlet border, gathered like a large frill, passed under the arms and reached below the waist; while a handsome fine cloth, fastened round the waist with a band or sash, covered the feet. The breasts were ornamented with rainbow-colored mother-of-pearl shells, and a covering of curiously wrought network and feathers. The music of the hura was the large and small drum and occasionally the flute. The movements were generally slow, but always easy and natural, and no exertion on the part of the performers was wanting to render them graceful and attractive." [168] We see here, in this very typical example, how the extraneous visual aids of movement, color, and brilliancy are invoked in conjunction with music to make the appeal of beauty more convincing in the process of sexual selection.

It may be in place here to mention, in passing, the considerable place which vision occupies in normal and abnormal methods of heightening tumescence under circumstances which exclude definite selection by beauty. The action of mirrors belongs to this group of phenomena. Mirrors are present in profusion in high-class brothels--on the walls and also above the beds. Innocent youths and girls are also often impelled to contemplate themselves in mirrors and sometimes thus, produce the first traces of sexual excitement. I have referred to the developed forms of this kind of self-contemplation in the Study of Auto-erotism, and in this connection have alluded to the fable of Narcissus, whence Näcke has since devised the term Narcissism for this group of phenomena. It is only necessary to mention the enormous production of photographs, representing normal and abnormal sexual actions, specially prepared for the purpose of exciting or of gratifying sexual appetites, and the frequency with which even normal photographs of the nude appeal to the same lust of the eyes.

Pygmalionism, or falling in love with statues, is a rare form of erotomania founded on the sense of vision and closely related to the allurements of beauty. (I here use "pygmalionism" as a general

term for the sexual love of statues; it is sometimes restricted to cases in which a man requires of a prostitute that she shall assume the part of a statue which gradually comes to life, and finds sexual gratification in this performance alone; Eulenburg quotes examples, *_Sexuale Neuropathie_*, p. 107.) An emotional interest in statues is by no means uncommon among young men during adolescence. Heine, in *_Florentine Nights_*, records the experiences of a boy who conceived a sentimental love for a statue, and, as this book appears to be largely autobiographical, the incident may have been founded on fact. Youths have sometimes masturbated before statues, and even before the image of the Virgin; such cases are known to priests and mentioned in manuals for confessors. Pygmalionism appears to have been not uncommon among the ancient Greeks, and this has been ascribed to their æsthetic sense; but the manifestation is due rather to the absence than to the presence of æsthetic feeling, and we may observe among ourselves that it is the ignorant and uncultured who feel the indecency of statues and thus betray their sense of the sexual appeal of such objects. We have to remember that in Greece statues played a very prominent part in life, and also that they were tinted, and thus more lifelike than with us. Lucian, Athenæus, Ælian, and others refer to cases of men who fell in love with statues. Tarnowsky (*_Sexual Instinct_*, English edition, p. 85) mentions the case of a young man who was arrested in St. Petersburg for paying moonlight visits to the statue of a nymph on the terrace of a country house, and Krafft-Ebing quotes from a French newspaper the case which occurred in Paris during the spring of 1877 of a gardener who fell in love with a Venus in one of the parks. (I. Bloch, *_Beiträge zur Ätiologie der Psychopathia Sexualis_*, Teil II, pp. 297-305, brings together various facts bearing on this group of manifestations.)

Necrophily, or a sexual attraction for corpses, is sometimes regarded as related to pygmalionism. It is, however, a more profoundly morbid manifestation, and may perhaps be regarded as a kind of perverted sadism.

Founded on the sense of vision also we find a phenomenon, bordering on the abnormal, which is by Moll termed mixoscopy. This means the sexual pleasure derived from the spectacle of other persons engaged in natural or perverse sexual actions. (Moll, *_Konträre Sexualempfindung_*, third edition, p. 308. Moll

considers that in some cases mixoscopy is related to masochism. There is, however, no necessary connection between the two phenomena.) Brothels are prepared to accommodate visitors who merely desire to look on, and for their convenience carefully contrived peepholes are provided; such visitors are in Paris termed "voyeurs." It is said by Coffignon that persons hide at night in the bushes in the Champs Elysées in the hope of witnessing such scenes between servant girls and their lovers. In England during a country walk I have come across an elderly man carefully ensconced behind a bush and intently watching through his field-glass a couple of lovers reclining on a bank, though the actions of the latter were not apparently marked by any excess of indecorum. Such impulses are only slightly abnormal, whatever may be said of them from the point of view of good taste. They are not very far removed from the legitimate curiosity of the young woman who, believing herself unobserved, turns her glass on to a group of young men bathing naked. They only become truly perverse when the gratification thus derived is sought in preference to natural sexual gratification. They are also not normal when they involve, for instance, a man desiring to witness his wife in the act of coitus with another man. I have been told of the case of a scientific man who encouraged his wife to promote the advances of a young friend of his own, in his own drawing-room, he himself remaining present and apparently taking no notice; the younger man was astonished, but accepted the situation. In such a case, when the motives that led up to the episode are obscure, we must not too hastily assume that masochism or even mixoscopy is involved. For information on some of the points mentioned above see, e.g., I. Bloch, Beiträge zur Ätiologie der Psychopathia Sexualis, Teil I, pp. 200 et seq.; Teil II, pp. 195 et seq.

Wide, however, as is the appeal of beauty in sexual selection, it cannot be said to cover by any means the whole of the visual field in its sexual relationship. Beauty in the human species is, above all, a feminine attribute, making its appeal to men. Even for women, as has already been noted, beauty is still a feminine quality, which they usually admire, and in cases of inversion worship with an ardor which equals, if it does not surpass, that experienced by normal men. But the normal woman experiences no corresponding cult for the beauty of man. The perfection of the body of man is not behind that of woman in beauty, but the study of it only appeals to the artist or the æsthetician; it arouses sexual enthusiasm

almost exclusively in the male sexual invert. Whatever may be the case among animals or even among savages, in civilization the man is most successful with women is not the most handsome man, and may be the reverse of handsome.[169] The maiden, according to the old saying, who has to choose between Adonis and Hercules, will turn to Hercules.

A correspondent writes: "Men are generally attracted in the first instance by a woman's beauty, either of face or figure. Frequently this is the highest form of love they are capable of. Personally, my own love is always prompted by this. In the case of my wife there was certainly a leaven of friendship and moral sympathies but these alone would never have been translated into love had she not been young and good-looking. Moreover, I have felt intense passion for other women, in my relations with whom the elements of moral or mental sympathy have not entered. And always, as youth and beauty went, I believe I should transfer my love to some one else.

"Now, in woman I fancy this element of beauty and youth does not enter so much. I have questioned a large number of women--some married, some unmarried, young and old ladies, shopgirls, servants, prostitutes, women whom I have known only as friends, others with whom I have had sexual relations--and I cannot recollect one instance when a woman said she had fallen in love with a man for his looks. The nearest approach to any sign of this was in the instance of one, who noticed a handsome man sitting near us in a hotel, and said to me: 'I should like him to kiss me.'

"I have also noticed that women do not like looking at my body, when naked, as I like looking at theirs. My wife has, on a few occasions, put her hand over my body, and expressed pleasure at the feeling of my skin. (I have very fair, soft skin.) But I have never seen women exhibit the excitement that is caused in me by the sight of their bodies, which I love to look at, to stroke, to kiss all over."

It is interesting to point out, in this connection, that the admiration of strength is not confined to the human female. It is by the spectacle of his force that the male among many of the lower animals sexually affects the female. Darwin duly allows for this fact, while some evolutionists, and notably Wallace,

consider that it covers the whole field of sexual selection. When choice exists, Wallace states, "all the facts appear to be consistent with the choice depending on a variety of male characteristics, with some of which color is often correlated. Thus, it is the opinion of some of the best observers that vigor and liveliness are most attractive, and these are, no doubt, usually associated with some intensity of color, ... There is reason to believe that it is his [the male bird's] persistency and energy rather than his beauty which wins the day." (A.R. Wallace, *Tropical Nature*, 1898, p. 199.) In his later book, *Darwinism* (p. 295), Wallace reaffirms his position that sexual selection means that in the rivalry of males for the female the most vigorous secures the advantage; "ornament," he adds, "is the natural product and direct outcome of superabundant health and vigor." As regards woman's love of strength, see Westermarck, *History of Marriage*, p. 255.

Women admire a man's strength rather than his beauty. This statement is commonly made, and with truth, but, so far as I am aware, its meaning is never analyzed. When we look into it, I think, we shall find that it leads us into a special division of the visual sphere of sexual allurements. The spectacle of force, while it remains strictly within the field of vision, really brings to us, although unconsciously, impressions that are correlated with another sense--that of touch. We instinctively and unconsciously translate visible energy into energy of pressure. In admiring strength we are really admiring a tactile quality which has been made visible. It may therefore be said that, while through vision men are sexually affected mainly by the more purely visual quality of beauty, women are more strongly affected by visual impressions which express qualities belonging to the more fundamentally sexual sense of touch.

The distinction between the man's view and the woman's view, here pointed out, is not, it must be added, absolute. Even for a man, beauty, with all these components which we have already analyzed in it, is not the sole sexual allurements of vision. A woman is not necessarily sexually attractive in the ratio of her beauty, and with even a high degree of beauty may have a low degree of attraction. The addition of vivacity or the addition of languor may each furnish a sexual allurements, and each of these is a translated tactile quality which possesses an obscure potency from vague sexual implications.[170] But while in the man the demand for these translated pressure qualities in the visible attractiveness of a woman are not usually quite clearly realized, in a woman the corresponding

craving for the visual expression of pressure energy is much more pronounced and predominant. It is not difficult to see why this should be so, even without falling back on the usual explanation that natural selection implies that the female shall choose the male who will be the most likely father of strong children and the best protector of his family. The more energetic part in physical love belongs to the man, the more passive part to the woman; so that, while energy in a woman is no index to effectiveness in love, energy in a man furnishes a seeming index to the existence of the primary quality of sexual energy which a woman demands of a man in the sexual embrace. It may be a fallacious index, for muscular strength is not necessarily correlated with sexual vigor, and in its extreme degrees appears to be more correlated with its absence. But it furnishes, in Stendhal's phrase, a probability of passion, and in any case it still remains a symbol which cannot be without its effect. We must not, of course, suppose that these considerations are always or often present to the consciousness of the maiden who "blushingly turns from Adonis to Hercules," but the emotional attitude is rooted in more or less unerring instincts. In this way it happens that even in the field of visual attraction sexual selection influences women on the underlying basis of the more primitive sense of touch, the fundamentally sexual sense.

Women are very sensitive to the quality of a man's touch, and appear to seek and enjoy contact and pressure to a greater extent than do men, although in early adolescence this impulse seems to be marked in both sexes. "There is something strangely winning to most women," remarks George Eliot, in *The Mill on the Floss*, "in that offer of the firm arm; the help is not wanted physically at that moment, but the sense of help--the presence of strength that is outside them and yet theirs--meets a continual want of the imagination."

Women are often very critical concerning a man's touch and his method of shaking hands. Stanley Hall (*Adolescence*, vol. ii, p. 8) quotes a gifted lady as remarking: "I used to say that, however much I liked a man, I could never marry him if I did not like the touch of his hand, and I feel so yet."

Among the elements of sexual attractiveness which make a special appeal to women, extreme personal cleanliness would appear to take higher rank than it takes in the eyes of a man, some men, indeed, seeming to make surprisingly small demands of a woman in this respect. If this is so we may connect it with the fact that

beauty in a woman's eye is to a much greater extent than in a man's a picture of energy, in other words, a translation of pressure contracts, with which the question of physical purity is necessarily more intimately associated than it is with the picture of purely visual beauty. It is noteworthy that Ovid (*Ars Amandi*, lib. I) urges men who desire to please women to leave the arts of adornment and effeminacy to those whose loves are homosexual, and to practice a scrupulous attention to extreme neatness and cleanliness of body and garments in every detail, a sun-browned skin, and the absence of all odor. Some two thousand years later Brummell in an age when extravagance and effeminacy often marked the fashions of men, introduced a new ideal of unobtrusive simplicity, extreme cleanliness (with avoidance of perfumes), and exquisite good taste; he abhorred all eccentricity, and may be said to have constituted a tradition which Englishmen have ever since sought, more or less successfully to follow; he was idolized by women.

It may be added that the attentiveness of women to tactile contacts is indicated by the frequency with which in them it takes on morbid forms, as the *délice du contact*, the horror of contamination, the exaggerated fear of touching dirt. (See, e.g., Raymond and Janet, *Les Obsessions et la Psychasthénie*.)

FOOTNOTES:

[168] William Ellis, *Polynesian Researches*, second edition, 1832, vol. 1, p. 215.

[169] Stendhal (*De l'Amour*, Chapter XVIII) has some remarks on this point, and refers to the influence over women possessed by Lekain, the famous actor, who was singularly ugly. "It is *passion*," he remarks, "which we demand; beauty only furnishes *probabilities*."

[170] The charm of a woman's garments to a man is often due in part to their expressiveness in rendering impressions of energy, vivacity, or languor. This has often been realized by the poets, and notably by Herrick, who was singularly sensitive to these qualities in a woman's garments.

IV.

The Alleged Charm of Disparity in Sexual Attraction--The Admiration for High Stature--The Admiration for Dark Pigmentation--The Charm of Parity--Conjugal Mating--The Statistical Results of Observation as Regards General Appearance, Stature, and Pigmentation of Married Couples--Preferential Mating and Assortative Mating--The Nature of the Advantage Attained by the Fair in Sexual Selection--The Abhorrence of Incest and the Theories of its Cause--The Explanation in Reality Simple--The Abhorrence of Incest in Relation to Sexual Selection--The Limits to the Charm of Parity in Conjugal Mating--The Charm of Disparity in Secondary Sexual Characters.

When we are dealing with the senses of touch, smell, and hearing it is impossible at present, and must always remain somewhat difficult, to investigate precisely the degree and direction of their influence in sexual selection. We can marshal in order--as has here been attempted--the main facts and considerations which clearly indicate that there is and must be such an influence, but we cannot even attempt to estimate its definite direction and still less to measure it precisely. With regard to vision, we are in a somewhat better position. It is possible to estimate the direction of the influence which certain visible characters exert on sexual selection, and it is even possible to attempt their actual measurement, although there must frequently be doubt as to the interpretation of such measurements.

Two facts render it thus possible to deal more exactly with the influence of vision on sexual selection than with the influence of the other senses. In the first place, men and women consciously seek for certain visible characters in the persons to whom they are attracted; in other words, their "ideals" of a fitting mate are visual rather than tactile, olfactory, or auditory. In the second place, whether such "ideals" are potent in actual mating, or whether they are modified or even inhibited by more potent psychological or general biological influences, it is in either case possible to measure and compare the visible characters of mated persons.

The two visible characters which are at once most frequently sought in a mate and most easily measurable are degree of stature and degree of

pigmentation. Every youth or maiden pictures the person he or she would like for a lover as tall or short, fair or dark, and such characters are measurable and have on a large scale been measured. It is of interest in illustration of the problem of sexual selection in man to consider briefly what results are at present obtainable regarding the influence of these two characters.

It has long been a widespread belief that short people are sexually attracted to tall people, and tall people to short; that in the matter of stature men and women are affected by what Bain called the "charm of disparity." It has not always prevailed. Many centuries ago Leonardo da Vinci, whose insight at so many points anticipated our most modern discoveries, affirmed clearly and repeatedly the charm of parity. After remarking that painters tend to delineate the figures that resemble themselves he adds that men also fall in love with and marry those who resemble themselves; "*_chi s'innamora voluntieri s'innamorano de cose a loro simiglianti_*," he elsewhere puts it.[171] But from that day to this, it would seem Leonardo's statements have remained unknown or unnoticed. Bernardin de Saint-Pierre said that "love is the result of contrasts," and Schopenhauer affirmed the same point very decisively; various scientific and unscientific writers have repeated this statement.[172]

So far as stature is concerned, there appears to be very little reason to suppose that this "charm of disparity" plays any notable part in constituting the sexual ideals of either men or women. Indeed, it may probably be affirmed that both men and women seek tallness in the person to whom they are sexually attracted. Darwin quotes the opinion of Mayhew that among dogs the females are strongly attracted to males of large size.[173] I believe this is true, and it is probably merely a particular instance of a general psychological tendency.

It is noteworthy as an indication of the direction of the sexual ideal in this matter that the heroines of male novelists are rarely short and the heroes of female novelists almost invariably tall. A reviewer of novels addressing to lady novelists in the *_Speaker_* (July 26, 1890) "A Plea for Shorter Heroes," publishes statistics on this point. "Heroes," he states, "are longer this year than ever. Of the 192 of whom I have had my word to say since October of last year, 27 were merely tall, and 11 were only slightly above the middle height. No less than 85 stood exactly six feet in their stocking soles, and the remainder were considerably over the two yards. I take the average to be six

feet three."

As a slight test alike of the supposed "charm of disparity" as well as of the general degree in which tall and short persons are sought as mates by those of the opposite sex I have examined a series of entries in the Round-About, a publication issued by a club, of which the president is Mr. W.T. Stead, having for its object the purpose of promoting correspondence, friendship, and marriage between its members. There are two classes, of entries, one inserted with a view to "intellectual friendship," the other with a view to marriage. I have not thought it necessary to recognize this distinction here; if a man describes his own physical characteristics and those of the lady he would like as a friend, I assume that, from the point of view of the present inquiry, he is much on the same footing as the man who seeks a wife. In the series of entries which I have examined 35 men and women state approximately the height of the man or woman they seek to know; 30 state in addition their own height. The results are expressed in the table on the following page.

Although the cases are few, the results are, in two main respects, sufficiently clear without multiplication of data. In the first place, those who seek parity, whether men or women, are in a majority over those who seek disparity. In the second place, the existence of any disparity at all is due only to the universal desire to find a tall person. Not one man or woman sets down shortness as his or her ideal. The very fact that no man in these initial announcements ventures to set himself down as short (although a considerable proportion describe themselves as tall) indicates a consciousness that shortness is undesirable, as also does the fact that the women very frequently describe themselves as tall.

The same charm of disparity which has been supposed to rule in selective attraction as regards stature has also been assumed as regards pigmentation. The fair, it is said, are attracted to the dark, the dark to the fair. Again, it must be said that this common assumption is not confirmed either by introspection or by any attempt to put the matter on a statistical basis.[174]

Most people who will carefully introspect their own feelings and ideals in this matter will find that they are not attracted to persons of the opposite sex who are strikingly unlike themselves in pigmentary characters. Even when the abstract ideal of a sexually desirable person is endowed with certain pigmentary characters, such as blue eyes or darkness,--either of which is liable to make a vaguely romantic appeal to the imagination,--it is usually found, on testing the feeling for particular persons, that the variation from the personal type of the subject is usually only agreeable within narrow limits, and that there is a very common tendency for persons of totally opposed pigmentary types, even though they may sometimes be considered to possess a certain æsthetic beauty, to be regarded as sexually unattractive or even repulsive. With this feeling may perhaps be associated the feeling, certainly very widely felt, that one would not like to marry a person of foreign, even though closely allied, race.

From the same number of the Round-About from which I have extracted the data on stature, I have obtained corresponding data on pigmentation, and have embodied them in the following table. They are likewise very scanty, but they probably furnish as good a general indication of the drift of ideals in this matter as we should obtain from more extensive data of the same character.

It will be seen that in the case of pigmentation there is not as in the case of stature a decided charm of parity in the formation of sexual ideals. The phenomenon, however, remains essentially analogous. Just as in regard to stature there is without exception an abstract admiration for tall persons, so here, though to a less marked extent, there is a general admiration for dark persons. As many as 6 out of 8 women and 14 out of 21 men seek a dark partner. This tendency ranges itself with the considerations already brought forward (p. 182), leading us to believe that, in England at all events, the admiration of fairness is not efficacious to promote any sexual selection, and that if there is actually any such selection it must be put down to other causes. No doubt, even in England the abstract æsthetic admiration of fairness is justifiable and may influence the artist. Probably also it influences the poet, who is affected by a long-established convention in favor of fairness, and perhaps also by a general tendency on the part of our poets to be themselves fair and to yield to the charm of parity,--the tendency to prefer the women of one's own stock,--which we have already found to be a real force.[175] But, as a matter of fact, our famous English beauties are not very fair; probably our handsomest men are not very fair, and the abstract sexual ideals of both our men and our women thus go out toward the dark.

The formation of a sexual ideal, while it furnishes a predisposition to be

attracted in a certain direction, and undoubtedly has a certain weight in sexual choice, is not by any means the whole of sexual selection. It is not even the whole of the psychic element in sexual selection. Let us take, for instance, the question of stature. There would seem to be a general tendency for both men and women, apart from and before experience, to desire sexually large persons of the opposite sex. It may even be that this is part of a wider zoölogical tendency. In the human species it shows itself also on the spiritual plane, in the desire for the infinite, in the deep and unreasoning feeling that it is impossible to have too much of a good thing. But it not infrequently happens that a man in whose youthful dreams of love the heroine has always been large, has not been able to calculate what are the special nervous and other characteristics most likely to be met in large women, nor how far these correlated characteristics would suit his own instinctive demands. He may, and sometimes does, find that in these other demands, which prove to be more important and insistent than the desire for stature, the tall women he meets are less likely to suit him than the medium or short women.[176] It may thus happen that a man whose ideal of woman has always been as tall may yet throughout life never be in intimate relationship with a tall woman because he finds that practically he has more marked affinities in the case of shorter women. His abstract ideals are modified or negatived by more imperative sympathies or antipathies.

In one field such sympathies have long been recognized, especially by alienists, as leading to sexual unions of parity, notwithstanding the belief in the generally superior attraction of disparity. It has often been pointed out that the neuropathic, the insane and criminal, "degenerates" of all kinds, show a notable tendency to marry each other. This tendency has not, however, been investigated with any precision.[177]

The first attempt on a statistical basis to ascertain what degree of parity or disparity is actually attained by sexual selection was made by Alphonse de Candolle.[178] Obtaining his facts from Switzerland, North Germany, and Belgium, he came to the conclusion that marriages are most commonly contracted between persons with different eye-colors, except in the case of brown-eyed women, who (as Schopenhauer stated, and as is seen in the English data of the sexual ideal I have brought forward) are found more attractive than others.

The first series of serious observations tending to confirm the result reached by the genius of Leonardo da Vinci and to show that sexual selection results in the pairing of like rather than of unlike persons was

made by Hermann Fol, the embryologist.[179] He set out with the popular notion that married people end by resembling each other, but when at Nice, which is visited by many young married couples on their honeymoons, he was struck by the resemblances already existing immediately after marriage. In order to test the matter he obtained the photographs of 251 young and old married couples not personally known to him. The results were as follows:

COUPLES.	RESEMBLANCES (PERCENTAGE).	NONRESEMBLANCES (PERCENTAGE).	TOTAL.
Young.....	132, about 66.66	66, about 33.33	198
Old	38, about 71.70	15, about 28.30	53

He concluded that in the immense majority of marriages of inclination the contracting parties are attracted by similarities, and not by dissimilarities, and that, consequently, the resemblances between aged married couples are not acquired during conjugal life. Although Fol's results were not obtained by good methods, and do not cover definite points like stature and eye-color, they represented the conclusions of a highly skilled and acute observer and have since been amply confirmed.

Galton could not find that the average results from a fairly large number of cases indicated that stature, eye-color, or other personal characteristics notably influenced sexual selection, as evidenced by a comparison of married couples.[180] Karl Pearson, however, in part making use of a large body of data obtained by Galton, referring to stature and eye-color, has reached the conclusion that sexual selection ultimately results in a marked degree of parity so far as these characters are concerned.[181] As regards stature, he is unable to find evidence of what he terms "preferential mating"; that is to say, it does not appear that any preconceived ideals concerning the desirability of tallness in sexual mates leads to any perceptibly greater tallness of the chosen mate; husbands are not taller than men in general, nor wives than women in general. In regard to eye-color, however, there appeared to be evidence of preferential mating. Husbands are very decidedly fairer than men in general, and though there is no such marked difference in women, wives are also somewhat fairer than women in general. As regards "assortative mating" as it is termed by Pearson,--the tendency to parity or to disparity between husbands and wives,--the result were in both cases decisive. Tall men marry women who are somewhat above the average in height; short men marry women who are somewhat below the average, so that husband and wife resemble each other in stature as closely as uncle and

niece. As regards eye-color there is also a tendency for like to marry like; the light-eyed men tend to marry light-eyed women more often than dark-eyed women; the dark-eyed men tend to marry dark-eyed women more often than light-eyed. There remains, however, a very considerable difference in the eye-color of husband and wife; in the 774 couples dealt with by Pearson there are 333 dark-eyed women to only 251 dark-eyed men, and 523 light-eyed men to only 441 light-eyed women. The women in the English population are darker-eyed than the men;[182] but the difference is scarcely so great as this; so that even if wives are not so dark-eyed as women generally it would appear that the ideal admiration for the dark-eyed may still to some extent make itself felt in actual mating.

While we have to recognize that the modification and even total inhibition of sexual ideals in the process of actual mating is largely due to psychic causes, such causes do not appear to cover the whole of the phenomena. Undoubtedly they count for much, and the man or the woman who, from whatever causes, has constituted a sexual ideal with certain characters may in the actual contacts of life find that individuals with other and even opposed characters most adequately respond to his or her psychic demands. There are, however, other causes in play here which at first sight may seem to be not of a purely psychic character. One unquestionable cause of this kind comes into action in regard to pigmentary selection. Fair people, possibly as a matter of race more than from absence of pigment, are more energetic than dark people. They possess a sanguine vigor and impetuosity which, in most, though not in all, fields and especially in the competition of practical life, tend to give them some superiority over their darker brethren. The greater fairness of husbands in comparison with men in general, as found by Karl Pearson, is thus accounted for; fair men are most likely to obtain wives. Husbands are fairer than men in general for the same reason that, as I have shown elsewhere,[183] created peers are fairer than either hereditary peers or even most groups of intellectual persons; they have possessed in higher measure the qualities that insure success. It may be added that with the recognition of this fact we have not really left the field of sexual psychology, for, as has already been pointed out, that energy which thus insures success in practical life is itself a sexual allurement to women. Energy in a woman in courtship is less congenial to her sexual attitude than to a man's, and is not attractive to men; thus it is not surprising, even apart from the probably greater beauty of dark women, that the preponderance of fairness among wives as compared to women generally, indicated by Karl Pearson's data, is very slight. It may possibly be accounted for altogether by homogamy--the tendency of like to marry

like--in the fair husbands.

The energy and vitality of fair people is not, however, it is probable, merely an indirect cause of the greater tendency of fair men to become husbands; that is to say, it is not merely the result of the generally somewhat greater ability of the fair to attain success in temporal affairs. In addition to this, fair men, if not fair women, would appear to show a tendency to a greater activity in their specifically sexual proclivities. This is a point which we shall encounter in a later Study and it is therefore unnecessary to discuss it here.

In dealing with the question of sexual selection in man various writers have been puzzled by the problem presented by that abhorrence of incest which is usually, though not always so clearly marked among the different races of mankind.[184] It was once commonly stated, as by Morgan and by Maine, that this abhorrence was the result of experience; the marriages of closely related persons were found to be injurious to offspring and were therefore avoided. This theory, however, is baseless because the marriages of closely related persons are not injurious to the offspring. Consanguineous marriages, so closely as they can be investigated on a large scale,--that is to say, marriages between cousins,--as Huth was the first to show, develop no tendency to the production of offspring of impaired quality provided the parents are sound; they are only injurious in this respect in so far as they may lead to the union of couples who are both defective in the same direction. According to another theory, that of Westermarck, who has very fully and ably discussed the whole question,[185] "there is an innate aversion to sexual intercourse between persons living very closely together from early youth, and, as such persons are in most cases related, this feeling displays itself chiefly as a horror of intercourse between near kin." Westermarck points out very truly that the prohibition of incest could not be founded on experience even if (as he is himself inclined to believe) consanguineous marriages are injurious to the offspring; incest is prevented "neither by laws, nor by customs, nor by education, but by an instinct which under normal circumstances makes sexual love between the nearest kin a psychic impossibility." There is, however, a very radical objection to this theory. It assumes the existence of a kind of instinct which can with difficulty be accepted. An instinct is fundamentally a more or less complicated series of reflexes set in action by a definite stimulus. An innate tendency at once so specific and so merely negative, involving at the same time deliberate intellectual processes, can only with a certain force be introduced into the accepted class of instincts. It is as awkward

and artificial an instinct as would be, let us say, an instinct to avoid eating the apples that grew in one's own yard.[186]

The explanation of the abhorrence to incest is really, however, exceedingly simple. Any reader who has followed the discussion of sexual selection in the present volume and is also familiar with the "Analysis of the Sexual Impulse" set forth in the previous volume of these Studies will quickly perceive that the normal failure of the pairing instinct to manifest itself in the case of brothers and sisters, or of boys and girls brought up together from infancy, is a merely negative phenomenon due to the inevitable absence under those circumstances of the conditions which evoke the pairing impulse. Courtship is the process by which powerful sensory stimuli proceeding from a person of the opposite sex gradually produce the physiological state of tumescence, with its psychic concomitant of love and desire, more or less necessary for mating to be effected. But between those who have been brought up together from childhood all the sensory stimuli of vision, hearing, and touch have been dulled by use, trained to the calm level of affection, and deprived of their potency to arouse the erethistic excitement which produces sexual tumescence.[187] Brothers and sisters in relation to each other have at puberty already reached that state to which old married couples by the exhaustion of youthful passion and the slow usage of daily life gradually approximate. Passion between brother and sister is, indeed, by no means so rare as is sometimes supposed, and it may be very strong, but it is usually aroused by the aid of those conditions which are normally required for the appearance of passion, more especially by the unfamiliarity caused by a long separation. In reality, therefore, the usual absence of sexual attraction between brothers and sisters requires no special explanation; it is merely due to the normal absence under these circumstances of the conditions that tend to produce sexual tumescence and the play of those sensory allurements which lead to sexual selection.[188] It is a purely negative phenomenon and it is quite unnecessary, even if it were legitimate, to invoke any instinct for its explanation. It is probable that the same tendency also operates among animals to some extent, tending to produce a stronger sexual attraction toward those of their species to whom they have not become habituated.[189] In animals, and in man also when living under primitive conditions, sexual attraction is not a constant phenomenon[190]; it is an occasional manifestation only called out by the powerful stimulation. It is not its absence which we need to explain; it is its presence which needs explanation, and such an explanation we find in the analysis of the phenomena of courtship.

The abhorrence of incest is an interesting and significant phenomenon from our present point of view, because it instructively points out to us the limits to that charm of parity which apparently makes itself felt to some considerable extent in the constitution of the sexual ideal and still more in the actual homogamy which seems to predominate over heterogamy. This homogamy is, it will be observed, a racial homogamy; it relates to anthropological characters which mark stocks. Even in this racial field, it is unnecessary to remark, the homogamy attained is not, and could not be, absolute; nor would it appear that such absolute racial homogamy is even desired. A tall man who seeks a tall woman can seldom wish her to be as tall as himself; a dark man who seeks a dark woman, certainly will not be displeased at the inevitably greater or less degree of pigment which he finds in her eyes as compared to his own.

But when we go outside the racial field this tendency to homogamy disappears at once. A man marries a woman who, with slight, but agreeable, variations, belongs to a like stock to himself. The abhorrence of incest indicates that even the sexual attraction to people of the same stock has its limits, for it is not strong enough to overcome the sexual indifference between persons of near kin. The desire for novelty shown in this sexual indifference to near kin and to those who have been housemates from childhood, together with the notable sexual attractiveness often possessed by a strange youth or maiden who arrives in a small town or village, indicates that slight differences in stock, if not, indeed, a positive advantage from this point of view, are certainly not a disadvantage. When we leave the consideration of racial differences to consider sexual differences, not only do we no longer find any charm of parity, but we find that there is an actual charm of disparity. At this point it is necessary to remember all that has been brought forward in earlier pages[191] concerning the emphasis of the secondary sexual characters in the ideal of beauty. All those qualities which the woman desires to see emphasized in the man are the precise opposite of the qualities which the man desires to see emphasized in the woman. The man must be strong, vigorous, energetic, hairy, even rough, to stir the primitive instincts of the woman's nature; the woman who satisfies this man must be smooth, rounded, and gentle. It would be hopeless to seek for any homogamy between the manly man and the virile woman, between the feminine woman and the effeminate man. It is not impossible that this tendency to seek disparity in sexual characters may exert some disturbing influences on the tendency to seek parity in anthropological racial characters, for the sexual difference to some extent makes itself felt in racial characters. A somewhat greater darkness of women is a secondary

(or, more precisely, tertiary) sexual character, and on this account alone, it is possible, somewhat attractive to men[192]. A difference in size and stature is a very marked secondary sexual character. In the considerable body of data concerning the stature of married couples reproduced by Pearson from Galton's tables, although the tall on the average tend to marry the tall, and the short the short, it is yet noteworthy that, while the men of 5 ft. 4 ins. have more wives at 5 ft. 2 ins. than at any other height, men of 6 ft. show, in an exactly similar manner, more wives at 5 ft. 2 ins. than at any other height, although for many intermediate heights the most numerous groups of wives are taller[193].

In matters of carriage, habit, and especially clothing the love of sexual disparity is instinctive, everywhere well marked, and often carried to very great lengths. To some extent such differences are due to the opposing demands of more fundamental differences in custom and occupation. But this cause by no means adequately accounts for them, since it may sometimes happen that what in one land is the practice of the men is in another the practice of the women, and yet the practices of the two sexes are still opposed[194]. Men instinctively desire to avoid doing things in women's ways, and women instinctively avoid doing things in men's ways, yet both sexes admire in the other sex those things which in themselves they avoid. In the matter of clothing this charm of disparity reaches its highest point, and it has constantly happened that men have even called in the aid of religion to enforce a distinction which seemed to them so urgent[195]. One of the greatest of sex allurements would be lost and the extreme importance of clothes would disappear at once if the two sexes were to dress alike; such identity of dress has, however, never come about among any people.

FOOTNOTES:

[171] L. da Vinci, *_Frammenti_*, selected by Solmi, pp. 177-180.

[172] Westermarck, who accepts the "charm of disparity," gives references, *_History of Human Marriage_*, p. 354.

[173] *_Descent of Man_*. Part II, Chapter XVIII.

[174] Bloch (*_Beiträge zur Ätiologie der Psychopathia Sexualis_*, Teil II, pp. 260 et seq.) refers to the tendency to admixture of races and to the

sexual attraction occasionally exerted by the negress and sometimes the negro on white persons as evidence in favor of such charm of disparity. In part, however, we are here concerned with vague statements concerning imperfectly known facts, in part with merely individual variations, and with that love of the exotic under the stimulation of civilized conditions to which reference has already been made (p. 184).

[175] In this connection the exceptional case of Tennyson is of interest. He was born and bred in the very fairest part of England (Lincolnshire), but he himself and the stock from which he sprang were dark to a very remarkable degree. In his work, although it reveals traces of the conventional admiration for the fair, there is a marked and unusual admiration for distinctly dark women, the women resembling the stock to which he himself belonged. See Havelock Ellis, "The Color Sense in Literature," *_Contemporary Review_*, May, 1896.

[176] It is noteworthy that in the *_Round-About_*, already referred to, although no man expresses a desire to meet a short woman, when he refers to announcements by women as being such as would be likely to suit him, the persons thus pointed out are in a notable proportion short.

[177] It has been discussed by F.J. Debret, *_La Selection Naturelle dans l'espèce humaine_* (Thèse de Paris), 1901. Debret regards it as due to natural selection.

[178] "Hérédité de la Couleur des Yeux dans l'espèce humaine," *_Archives des Sciences physiques et naturelles_*, sér. iii, vol. xii, 1884, p. 109.

[179] *_Revue Scientifique_*, Jan., 1891.

[180] F. Galton, *_Natural Inheritance_*, p. 85. It may be remarked that while Galton's tables on page 206 show a slight excess of disparity as regards sexual selection in stature, in regard to eye color they anticipate Karl Pearson's more extensive data and in marriages of disparity show a decided deficiency of observed over chance results. In *_English Men of Science_* (pp. 28-33), also, Galton found that among the parents parity decidedly prevailed over disparity (78 to 31) alike as regards temperament, hair color, and eye color.

[181] Karl Pearson, *_Phil. Trans. Royal Society_*, vol. clxxxvii, p. 273, and vol. cxcv, p. 113; *_Proceedings of the Royal Society_*, vol. lxvi, p. 28; *_Grammar of Science_*, second edition, 1900, pp. 425 *_et seq._*;

Biometrika, November, 1903. The last-named periodical also contains a study on "Assortative Mating in Man," bringing forward evidence to show that, apart from environmental influence, "length of life is a character which is subject to selection;" that is to say, the long-lived tend to marry the long-lived, and the short-lived to marry the short-lived.

[182] For a summary of the evidence on this point see Havelock Ellis, _Man and Woman_, fourth edition, 1904, pp. 256-264.

[183] "The Comparative Abilities of the Fair and the Dark," _Monthly Review_, August, 1901.

[184] The fact that even in Europe the abhorrence to incest is not always strongly felt is brought out by Bloch, _Beiträge zur Ätiologie der Psychopathia Sexualis_, Teil II, pp. 263 et seq.

[185] Westermarck, _History of Marriage_, Chapters XIV and XV.

[186] Crawley (_The Mystic Rose_, p. 446) has pointed out that it is not legitimate to assume the possibility of an "instinct" of this character; instinct has "nothing in its character but a response of function to environment."

[187] Fromentin, in his largely autobiographic novel _Dominique_, makes Olivier say: "Julie is my cousin, which is perhaps a reason why she should please me less than anyone else. I have always known her. We have, as it were, slept in the same cradle. There may be people who would be attracted by this almost fraternal relationship. To me the very idea of marrying someone whom I knew as a baby is as absurd as that of coupling two dolls."

[188] It may well be, as Crawley argues (_The Mystic Rose_, Chapter XVII), that sexual taboo plays some part among primitive people in preventing incestuous union, as, undoubtedly, training and moral ideas do among civilized peoples.

[189] The remarks of the Marquis de Brisay, an authority on doves, as communicated to Giard (_L'Intermédiaire des Biologistes_, November 20, 1897), are of much interest on this point, since they correspond to what we find in the human species: "Two birds from the same nest rarely couple. Birds coming from the same nest behave as though they regarded coupling as prohibited, or, rather, they know each other too well, and seem to be ignorant of their difference in sex, remaining unaffected in their

relations by the changes which make them adults." Westermarck (op. cit., p. 334) has some remarks on a somewhat similar tendency sometimes observed in dogs and horses.

[190] See Appendix to vol. lii of these *_Studies_*, "The Sexual Impulse among Savages."

[191] See, especially, *_ante_*, pp. 163 et seq.

[192] Kistemaecker, as quoted by Bloch (*_Beiträge, etc._*, ii. p. 340), alludes in this connection to the dark clothes of men and to the tendency of women to wear lighter garments, to emphasize the white underlinen, to cultivate pallor of the face, to use powder. "I am white and you are brown; ergo, you must love me"; this affirmation, he states, may be found in the depths of every woman's heart.

[193] K. Pearson, *_Grammar of Science_*, second edition, p. 430.

[194] In *_Man and Woman_* (fourth edition, p. 65) I have referred to a curious example of this tendency to opposition, which is of almost worldwide extent. Among some people it is, or has been, the custom for the women to stand during urination, and in these countries it is usually the custom for the man to squat; in most countries the practices of the sexes in this matter are opposed.

[195] It is sufficient to quote one example. At the end of the sixteenth century it was a serious objection to the fashionable wife of an English Brownist pastor in Amsterdam that she had "bodies [a bodice or corset] tied to the petticoat with points [laces] as men do their doublets and their hose, contrary to I Thess., v, 22, conferred with Deut. xxii, 5; and I John ii, 16."

V.

Summary of the Conclusions at Present Attainable in Regard to the Nature of Beauty and its Relation to Sexual Selection.

The consideration of vision has led us into a region in which, more

definitely and precisely than is the case with any other sense, we can observe and even hope to measure the operation of sexual selection in man. In the conception of feminine beauty we possess an instrument of universal extension by which it seems possible to measure the nature and extent of such selection as exercised by men on women. This conception, with which we set out, is, however, by no means so precise, so easily available for the attainment of sound conclusions, as at first it may seem to be.

It is true that beauty is not, as some have supposed, a mere matter of caprice. It rests in part on (1) an objective basis of æsthetic character which holds all its variations together and leads to a remarkable approximation among the ideals of feminine beauty cherished by the most intelligent men of all races. But beyond this general objective basis we find that (2) the specific characters of the race or nation tend to cause divergence in the ideals of beauty, since beauty is often held to consist in the extreme development of these racial or national anthropological features; and it would, indeed, appear that the full development of racial characters indicates at the same time the full development of health and vigor. We have further to consider that (3) in most countries an important and usually essential element of beauty lies in the emphasis of the secondary and tertiary sexual characters: the special characters of the hair in woman, her breasts, her hips, and innumerable other qualities of minor saliency, but all apt to be of significance from the point of view of sexual selection. In addition we have (4) the factor of individual taste, constituted by the special organization and the peculiar experiences of the individual and inevitably affecting his ideal of beauty. Often this individual factor is merged into collective shapes, and in this way are constituted passing fashions in the matter of beauty, certain influences which normally affect only the individual having become potent enough to affect many individuals. Finally, in states of high civilization and in individuals of that restless and nervous temperament which is common in civilization, we have (5) a tendency to the appearance of an exotic element in the ideal of beauty, and in place of admiring that kind of beauty which most closely approximates to the type of their own race men begin to be agreeably affected by types which more or less deviate from that with which they are most familiar.

While we have these various and to some extent conflicting elements in a man's ideal of feminine beauty, the question is still further complicated by the fact that sexual selection in the human species is not merely the choice of the woman by the man, but also the choice of the man by the woman. And when we come to consider this we find that the standard is

altogether different, that many of the elements of beauty as it exists in woman for man have here fallen away altogether, while a new and preponderant element has to be recognized in the shape of a regard for strength and vigor. This, as I have pointed out, is not a purely visual character, but a tactile pressure character translated into visual terms.

When we have stated the sexual ideal we have not yet, however, by any means stated the complete problem of human sexual selection. The ideal that is desired and sought is, in a large measure, not the outcome of experience; it is not even necessarily the expression of the individual's temperament and idiosyncrasy. It may be largely the result of fortuitous circumstances, of slight chance attractions in childhood, of accepted traditions consecrated by romance. In the actual contacts of life the individual may find that his sexual impulse is stirred by sensory stimuli which are other than those of the ideal he had cherished and may even be the reverse of them.

Beyond this, also, we have reason for believing that factors of a still more fundamentally biological character, to some extent deeper even than all these psychic elements, enter into the problem of sexual selection. Certain individuals, apart altogether from the question of whether they are either ideally or practically the most fit mates, display a greater energy and achieve a greater success than others in securing partners. These individuals possess a greater constitutional vigor, physical or mental, which conduces to their success in practical affairs generally, and probably also heightens their specifically philogamic activities.

Thus, the problem of human sexual selection is in the highest degree complicated. When we gather together such scanty data of precise nature as are at present available, we realize that, while generally according with the results which the evidence not of a quantitative nature would lead us to accept, their precise significance is not at present altogether clear. It would appear on the whole that in choosing a mate we tend to seek parity of racial and individual characters together with disparity of secondary sexual characters. But we need a much larger number of groups of evidence of varying character and obtained under varying conditions. Such evidence will doubtless accumulate now that its nature is becoming defined and the need for it recognized. In the meanwhile we are, at all events, in a position to assert, even with the evidence before us, that now that the real meaning of sexual selection is becoming clear its efficacy in human evolution can no longer be questioned.

APPENDICES

APPENDIX A.

THE ORIGINS OF THE KISS.

Manifestations resembling the kiss, whether with the object of expressing affection or sexual emotion, are found among various animals much lower than man. The caressing of the antennæ practiced by snails and various insects during sexual intercourse is of the nature of a kiss. Birds use their bills for a kind of caress. Thus, referring to guillemots and their practice of nibbling each other's feet, and the interest the mate always takes in this proceeding, which probably relieves irritation caused by insects, Edmund Selous remarks: "When they nibble and preen each other they may, I think, be rightly said to cosset and caress, the expression and pose of the bird receiving the benefit being often beatific." [196] Among mammals, such as the dog, we have what closely resembles a kiss, and the dog who smells, licks, and gently bites his master or a bitch, combines most of the sensory activities involved in the various forms of the human kiss.

As practiced by man, the kiss involves mainly either the sense of touch or that of smell. Occasionally it involves to some extent both sensory elements. [197]

The tactile kiss is certainly very ancient and primitive. It is common among mammals generally. The human infant exhibits, in a very marked degree, the impulse to carry everything to the mouth and to lick or attempt to taste it, possibly, as Compayre suggests, [198] from a memory of the action of the lips protruded to seize the maternal nipple. The affectionate child, as Mantegazza remarks, [199] not only applies inanimate objects to its lips or tongue, but of its own impulse licks the people it likes. Stanley Hall, in the light of a large amount of information he obtained on this point, found that "some children insist on licking the cheeks, necks, and hands of those they wish to caress," or like having animals lick them. [200] This impulse in children may be associated with the maternal impulse in animals to lick the young. "The method of licking

the young practiced by the mother," remarks S.S. Buckman, "would cause licking to be associated with happy feelings. And, further, there is the allaying of parasitical irritation which is afforded by the rubbing and hence results in pleasure. It may even be suggested that the desire of the mother to lick her young was prompted in the first place by a desire to bestow on her offspring a pleasure she felt herself." The licking impulse in the child may thus, it is possible, be regarded as the evanescent manifestation of a more fundamental animal impulse,[201] a manifestation which is liable to appear in adult life under the stress of strong sexual emotion. Such an association is of interest if, as there is some reason to believe, the kiss of sexual love originated as a development of the more primitive kiss bestowed by the mother on her child, for it is sometimes found that the maternal kiss is practiced where the sexual kiss is unknown.

The impulse to bite is also a part of the tactile element which lies at the origin of kissing. As Stanley Hall notes, children are fond of biting, though by no means always as a method of affection. There is, however, in biting a distinctly sexual origin to invoke, for among many animals the teeth (and among birds the bill) are used by the male to grasp the female more firmly during intercourse. This point has been discussed in the previous volume of these *_Studies_* in reference to "Love and Pain," and it is unnecessary to enter into further details here. The heroine of Kleist's *_Penthesilea_* remarks: "Kissing (Küsse) rhymes with biting (Bisse), and one who loves with the whole heart may easily confound the two."

The kiss, as known in Europe, has developed on a sensory basis that is mainly tactile, although an olfactory element may sometimes coexist. The kiss thus understood is not very widely spread and is not usually found among rude and uncultured peoples. We can trace it in Aryan and Semitic antiquity, but in no very pronounced form; Homer scarcely knew it, and the Greek poets seldom mention it. Today it may be said to be known all over Europe except in Lapland. Even in Europe it is probably a comparatively modern discovery; and in all the Celtic tongues, Rhys states, there is no word for "kiss," the word employed being always borrowed from the Latin *_pax_*. [202] At a fairly early historic period, however, the Welsh Cymri, at all events, acquired a knowledge of the kiss, but it was regarded as a serious matter and very sparingly used, being by law only permitted on special occasions, as at a game called rope-playing or a carousal; otherwise a wife who kissed a man not her husband could be repudiated. Throughout eastern Asia it is unknown; thus, in Japanese literature kisses

and embraces have no existence. "Kisses, and embraces are simply unknown in Japan as tokens of affection," Lafcadio Hearn states, "if we except the solitary fact that Japanese mothers, like mothers all over the world, lip and hug their little ones betimes. After babyhood there is no more hugging or kisses; such actions, except in the case of infants, are held to be immodest. Never do girls kiss one another; never do parents kiss or embrace their children who have become able to walk." This holds true, and has always held true, of all classes; hand-clasping is also foreign to them. On meeting after a long absence, Hearn remarks, they smile, perhaps cry a little, they may even stroke each other, but that is all. Japanese affection "is chiefly shown in acts of exquisite courtesy and kindness." [203] Among nearly all of the black races of Africa lovers never kiss nor do mothers usually kiss their babies. [204] Among the American Indians the tactile kiss is, for the most part, unknown, though here and there, as among the Fuegians, lovers rub their cheeks together. [205] Kissing is unknown to the Malays. In North Queensland, however, Roth states, kissing takes place between mothers (not fathers) and infants, also between husbands and wives; but whether it is an introduced custom Roth is unable to say; he adds that the Pitta-pitta language possesses a word for kissing. [206]

It must be remarked, however, that in many parts of the world where the tactile kiss, as we understand it, is usually said to be unknown, it still exists as between a mother and her baby, and this seems to support the view advocated by Lombroso that the lovers' kiss is developed from the maternal kiss. Thus, the Angoni Zulus to the north of the Zambesi, Wiese states, kiss their small children on both cheeks [207] and among the Fuegians, according to Hyades, mothers kiss their small children.

Even in Europe the kiss in early mediæval days was, it seems probable, not widely known as an expression of sexual love; it would appear to have been a refinement of love only practiced by the more cultivated classes. In the old ballad of Glasgerion the lady suspected that her secret visitor was only a churl, and not the knight he pretended to be, because when he came in his master's place to spend the night with her he kissed her neither coming nor going, but simply got her with child. It is only under a comparatively high stage of civilization that the kiss has been emphasized and developed in the art of love. Thus the Arabic author of the *_Perfumed Garden_*, a work revealing the existence of a high degree of social refinement, insists on the great importance of the kiss, especially if applied to the inner part of the mouth, and he quotes a proverb that "A moist kiss is better than a hasty coitus." Such kisses, as well as on the

face generally, and all over the body, are frequently referred to by Hindu, Latin, and more modern erotic writers as among the most efficacious methods of arousing love.[208]

A reason which may have stood in the way of the development of the kiss in a sexual direction has probably been the fact that in the near East the kiss was largely monopolized for sacred uses, so that its erotic potentialities were not easily perceived. Among the early Arabians the gods were worshiped by a kiss.[209] This was the usual way of greeting the house gods on entering or leaving.[210] In Rome the kiss was a sign of reverence and respect far more than a method of sexual excitation.[211] Among the early Christians it had an all but sacramental significance. It retains its ancient and serious meaning in many usages of the Western and still more the Eastern Churches; the relics of saints, the foot of the pope, the hands of bishops, are kissed, just as the ancient Greeks kissed the images of the gods. Among ourselves we still have a legally recognized example of the sacredness of the kiss in the form of taking an oath by kissing the Testament.[212]

So far we have been concerned mainly with the tactile kiss, which is sometimes supposed to have arisen in remote times to the east of the Mediterranean--where the vassal kissed his suzerain and where the kiss of love was known, as we learn from the Songs of Songs, to the Hebrews--and has now conquered nearly the whole of Europe. But over a much larger part of the world and even in one corner of Europe (Lapland, as well as among the Russian Yakuts) a different kind of salutation rules, the olfactory kiss. This varies in form in different regions and sometimes simulates a tactile kiss, but, as it exists in a typical form in China, where it has been carefully studied by d'Enjoy, it may be said to be made up of three phases: (1) the nose is applied to the cheek of the beloved person; (2) there is a long nasal inspiration accompanied by lowering of the eyelids; (3) there is a slight smacking of the lips without the application of the mouth to the embraced cheek. The whole process, d'Enjoy considers, is founded on sexual desire and the desire for food, smell being the sense employed in both fields. In the form described by d'Enjoy, we have the Mongolian variety of the olfactory kiss. The Chinese regard the European kiss as odious, suggesting voracious cannibals, and yellow mothers in the French colonies still frighten children by threatening to give them the white man's kiss. Their own kiss the Chinese regard as exclusively voluptuous; it is only befitting as between lovers, and not only do fathers refrain from kissing their children except when very young, but even the mothers only give their children a rare and furtive kiss. Among

some of the hill-tribes of south-east India the olfactory kiss is found, the nose being applied to the cheek during salutation with a strong inhalation; instead of saying "Kiss me," they here say "Smell me." The Tamils, I am told by a medical correspondent in Ceylon, do not kiss during coitus, but rub noses and also lick each other's mouth and tongue. The olfactory kiss is known in Africa; thus, on the Gambia in inland Africa when a man salutes a woman he takes her hand and places it to his nose, twice smelling the back of it. Among the Jekris of the Niger coast mothers rub their babies with their cheeks or mouths, but they do not kiss them, nor do lovers kiss, though they squeeze, cuddle, and embrace.[213] Among the Swahilis a smell kiss exists, and very young boys are taught to raise their clothes before women visitors, who thereupon playfully smell the penis; the child who does this is said to "give tobacco." [214] Kissing of any kind appears to be unknown to the Indians throughout a large part of America: Im Thurn states that it is unknown to the Indians of Guiana, and at the other end of South America Hyades and Deniker state that it is unknown to the Fuegians. In North America the olfactory kiss is known to the Eskimo, and has been noted among some Indian tribes, as the Blackfeet. It is also known in Polynesia. At Samoa kissing was smelling. [215] In New Zealand, also, the *hongi*, or nose-pressing, was the kiss of welcome, of mourning, and of sympathy. [216] In the Malay archipelago, it is said, the same word is used for "greeting" and "smelling." Among the Dyaks of the Malay archipelago, however, Vaughan Stevens states that any form of kissing is unknown. [217] In Borneo, Breitenstein tells us, kissing is a kind of smelling, the word for smelling being used, but he never himself saw a man kiss a woman; it is always done in private. [218]

The olfactory kiss is thus seen to have a much wider extension over the world than the European (or Mediterranean) tactile kiss. In its most complete development, however, it is mainly found among the people of Mongolian race, or those yellow peoples more or less related to them.

The literature of the kiss is extensive. So far, however, as that literature is known to me, the following list includes everything that may be profitably studied: Darwin, *The Expression of the Emotions*; Ling Roth, "Salutations," *Journal of the Anthropological Institute*, November, 1889; K. Andree, "Nasengruss," *Ethnographische Parallelen*, second series, 1889, pp. 223-227; Alfred Kirchhoff, "Vom Ursprung des Kusses," *Deutsche Revue*, May, 1895; Lombroso, "L'Origine du Baiser," *Nouvelle Revue*, 1897, p. 153; Paul d'Enjoy, "Le Baiser en Europe et en Chine," *Bulletin de la Société d'Anthropologie*, Paris, 1897, fasc. 2. Professor Nyrop's book, *The Kiss and its History* (translated from the Danish by

W.F. Harvey), deals rather with the history of the kiss in civilization and literature than with its biological origins and psychological significance.

FOOTNOTES:

[196] E. Selous, *_Bird Watching_*, 1901, p. 191. This author adds: "It seems probable indeed that the conferring a practical benefit of the kind indicated may be the origin of the caress throughout nature."

[197] Tylor terms the kiss "the salute by tasting," and d'Enjoy defines it as "a bite and a suction"; there seems, however, little evidence to show that the kiss contains any gustatory element in the strict sense.

APPENDIX B.

HISTORIES OF SEXUAL DEVELOPMENT.

The histories here recorded are similar in character to those given in Appendix B of the previous volume.

HISTORY I.--C.D., clergyman, age, 34. Height about 5 ft. 8 in. Weight, 8st. 8lb. Complexion, fair. Physical infirmities, very myopic, tendency to consumption.

"My family is of old lineage on both sides. My parents were normal and fairly healthy; but I consider that heredity, though not vitiated, is somewhat overrefined, and there is a neuropathic tendency, which has appeared in myself and in one or two other members of the family. As a child, I suffered, though not very frequently, from nocturnal enuresis. My sexual nature, though normal, has been keenly alive and sensitive as far back as I can remember; and as I look back I discern within myself in early childhood what I now understand to be a decided masochistic or passively algolagnic tendency. So far as I remember, this manifested itself in me in two aspects; one psychic or sentimental and free from carnality, expressing itself in imaginative visions such as the following: I used, to imagine myself kneeling before a young and beautiful woman and being sentenced by her to some punishment, and even threatened with death. At other times I would picture myself as a wounded soldier watched over on his sickbed by queenly women. These visions always included an imagination of something heroic in my own personality. No doubt they were the same kind of dreamings as are present in multitudes of imaginative children; they are only of interest in so far as a sexual element was present; and that was algolagnic in character.

"I had a small fund of natural common sense; and my surroundings were not favorable to sentimental imaginings; consequently I believe I began to throw them off at an early age, though the temperament which produced them is still a part of my nature.

"On the carnal side, the sexual instinct was decidedly algolagnic. Masturbation is one of my earliest recollections; indeed, it was not at first, so far as I remember, associated with any sexual ideas at all; but began as a reflex animal act. I do not remember its first occurrence. It soon, however, became associated in my mind with algolagnic excitement, giving rise to reveries which took the ordinary form of imagining oneself stripped and whipped, etc., by persons of the opposite sex. The dramatis personæ in my own algolagnic reveries were elderly women; somewhat strangely, I did not associate physical sexuality

at this period with young and attractive women. If scientific light on these matters were generally available in the practical bringing up of children, persons in charge of young children might refrain from exciting an algolagnic tendency or doing anything calculated to awake sexual emotions prematurely. In my own case, I recollect acts performed by older persons in ignorance and thoughtlessness which undoubtedly tended to foster and strengthen my algolagnic instinct.

"Little or nothing was done to prevent, discover, or remedy the pernicious habit into which I was falling unknowingly. Circumcision was perhaps little thought of in those days as a preventive of juvenile masturbation; at any rate, it was not resorted to in my case. I remember, indeed, that a nurse discovered that I was practicing masturbation, and I think she made a few half-hearted attempts to stop it. It was probably these attempts which gave me a growing feeling that there was something wrong about masturbation, and that it must be practiced secretly. But they were unsuccessful in their main object. The practice continued.

"I went to school at the age of 10. There I came in contact almost without warning, with the ordinary lewdness and grossness of school conversation, and took to it readily. I soon became conversant with the theory of sexual relations; but never got the opportunity of sexual intercourse, and probably should have felt some moral restraint even had such opportunity presented itself, for coitus, however interesting it might be to talk about, was a bigger thing to practice than masturbation. I masturbated fairly frequently, occasionally producing two orgasms in quick succession. I seldom masturbated with the hand; my method was to lie face downward. There was probably little or no homosexuality at my first school. I never heard of it till later, and it was always repugnant to me, though surrounded with a certain morbid interest. Masturbation was discountenanced openly at the school, but was, I believe, extensively practiced, both at that school and at the two others I afterward attended. The boys often talked about the hygiene of it; and the general theory was that it was somehow physically detrimental; but I heard no arguments advanced sufficiently cogent to make me see the necessity for a real moral effort against the habit, though, as I neared puberty, I was indulging more moderately and with greater misgivings.

"The fact of becoming acquainted with the theory of sexual intercourse tended to diminish the algolagnia, and to impel my sexual instinct into an ordinary channel. On one occasion circumstances brought me into close contact with a woman for about three or four weeks, I being a mere boy and she very much my senior. I felt sexually attracted by this woman, and allowed myself a degree of familiarity with her which I have since recognized as undue and have deeply regretted. It did not, however, go to the length of seduction, and I trust may have passed away without leaving any permanent harm. It should, indeed, be remarked here that I never knew a woman sexually till my marriage; and with the one exception mentioned I do not recall any instance of conduct on my part toward a woman which could be described as giving her an impulse downhill.

"On the psychic side my sexual emotions awoke in early childhood; and though my love affairs as a boy were not frequent and were kept to myself, they attained a considerable degree of emotional power. Leaving out of account the precocious movements of the sexual instinct to which I have already referred as colored by psychic algolagnia, I may say that somewhat later, from the age of puberty and onward, I had three or four love affairs, devoid of any algolagnic tendency, and considerably more developed on the psychic and emotional, than on the physical, side. In fact, my experience has been that when deeply in love, when the mind is full of the love ecstasy, the physical element of sexuality is kept--doubtless only temporarily--in abeyance.

"To return now to the subject of masturbation. Here befell the chief moral struggle of my early life; and no terms that I have at command will adequately describe the stress of it.

"A casual remark heard one day as I was arriving at puberty convinced me that there must be truth in the vague schoolboy theory that masturbation was weakening. It was to the effect that the evil results of masturbation practiced in boyhood would manifest themselves in later life. I then realized that I must relinquish masturbation, and I set myself to fight it; but with grave misgivings that, owing to the early age at which I had formed the habit, I had already done myself serious harm.

"Before many weeks had passed, I had formed a resolution to abstain, which I kept thereafter without--so far as I remember--more than one conscious lapse into my former habit. Here it must be said at once that, so far as touches my own experience of a struggle of this kind, the religious factor is of primary importance as strengthening and sustaining the moral effort which has to be made. I am writing an account of my sexual, not my spiritual, experiences; but I should not only be untrue to my convictions, but unable to give an accurate and penetrating survey of the development of my sex life, unless I were clearly to state that it was to a large extent on that life that my strongest and most valuable religious experiences arose.[219] It is to the endeavor to discipline the sexual instinct, and to grapple with the difficulties and anxieties of the sex life, that I owe what I possess of spiritual religion, of the consciousness that my life has been brought into contact with Divine love and power.

"My early habits, after they were broken off, left me none the less a legacy of sexual neurasthenia and a slight varicoccele. My nocturnal pollutions were overfrequent; and I brooded over them, being too reticent and too much afraid of exposure at school and possible expulsion to confide in a doctor. Far better for me had I done so, for a few years later I received the truest kindness and sympathy in regard to sexual matters at the hands of more than one medical man. But while at school I was afraid to speak of the trouble which so unnerved and depressed me; and as a consequence my morbid fears grew stronger, being intensified by generalities which I met with from time to time in my reading on the subject of the punishment which nature metes out to impurity.

"On leaving school my sex life continued for some years on the same lines: a struggle for chastity, morbid fears and regrets about the past, efforts to cope with the neurasthenia, and a haunting dread of coming insanity. These troubles were increased by my sedentary life. However I obtained medical aid, and put as good a face on matters as possible.

"But the most trying thing of all has yet to be mentioned--the discovery that I had not yet got fully clear of the habit of masturbation. I had, indeed, repudiated it as far as my conscious waking moments were concerned, even though strongly impelled by

sexual desire; but one night, about a year after I had relinquished the practice, I found myself again giving way to it in those moments between sleeping and waking when the will is only semiconscious. It was as if a race took place for wakefulness between my physical instinct, on the one side, and my moral sense and inhibitory nerves on the other; and very frequently the physical instinct won. This, perhaps, is not an uncommon experience, but it distressed me greatly; and I never felt safe from it until marriage. I resorted to various expedients to combat this tendency, at length having to tie myself in a certain position every night with a cord round my legs, so as to render it impossible to turn over upon my face.

"In my early manhood the strain on my constitution was considerable from causes other than the sexual neurasthenia, which, indeed, I am now well aware I exaggerated in importance. Medical advisers whom I consulted in that period assured me that this was so; and, though at the time I often thought that they were concealing the real facts from me out of kindness, my own reading has since convinced me that they spoke nothing but scientific truth.

"The years went on. I went through a university course, and in spite of my poor health took a good degree. The agony of my struggle for chastity seemed to come to a climax about four years later when for a long period, partly owing to overstudy and partly to the sexual strain, I fell into a condition of severe nervous exhaustion, one of the most distressing symptoms of which was insomnia. The dreaded cloud of insanity seemed to come closer. I had to use alcohol freely at nights; and might by now have become a drunkard, had I not been casually--or I must say, Providentially--directed to the common sense plan of measuring my whisky in a dram glass; so that the alcohol could not steal a march upon me.

"This period was one of acute mental suffering. One cause of the nervous tension was--as I have now no doubt--the need of healthy sexual intercourse. I proved this eventually. My circumstances, which had long been adverse to marriage, at length were shaped in that direction. I renewed acquaintance with a lady whom I had known well some years before; and our friendship ripened until, after much perplexity on my side, owing to the uncertainty of my

health and prospects, I decided that it was right to speak. We were married after a few months; and I realized that I had gained an excellent wife. We did not come together sexually for some nights after marriage; but, having once tasted the pleasure of the marriage bed, I have to admit that, partly owing to ignorance of the hygiene of marriage, I was for some time rather unrestrained in conjugal relations, requiring intercourse as often as eight or nine times a month. This was not unnatural when one considers that I had now for the first time free access to a woman, after a long and weary struggle to preserve chastity. Married life, however, tends naturally--or did so in my case--to regulate desire; and when I began to understand the ethics and hygiene of sex, as I did a year or two after marriage, I was enabled to exercise increasing self-restraint. We are now sparing in our enjoyment of conjugal pleasure. We have had no children; and I attribute this chiefly to the remaining sexual weakness in myself.[220] But I may say that not only my sexual power, but my nerve-power and general health, were greatly improved by marriage; and though I have fallen back, the last year or two, into a poor state of health, the cause of this is probably overwork rather than anything to do with sex. Not but what it must be said that, had it not been for the juvenile masturbation superadded to a neuropathic temperament, my constitution would no doubt have endured the general strain of life better than it has done. The algolagnia, being one of the congenital conditions of my sexual instinct, must be considered fundamental, and certainly has not been eliminated. If I were to allow myself indulgence in algolagnic reveries they would even now excite me without difficulty; but I have systematically discouraged them, so that they give me little or no practical trouble. My erotic dreams, which years ago were (to the best of my remembrance) frequently algolagnic, are now almost invariably normal.

"My conjugal relations have always been on the lines of strictly normal sexuality. I have a deep sense of the obligations of monogamous marriage, besides a sincere affection for my wife; consequently I repress as far as possible all sexual inclinations, such as will come involuntarily sometimes, toward other women.

"From what I have disclosed, it will be seen that I am but a frail man; but for many years I have striven honestly and hard to

discipline sexuality within myself, and to regulate it according to right reason, pure hygiene, and the moral law; and I can but hope and believe that the Divine Power in which I have endeavored to trust will in the future, as it has done in the past, working by natural methods and through the current events of my life, amend and control my sex life and conduct it to safe and honorable issues."

HISTORY II.--A.B., married, good general health, dark hair, fair complexion, short-sighted, and below medium height. Parents both belong to healthy families, but the mother suffered from nerves during early years of married life, and the father, a very energetic and ambitious man, was cold, passionless, and unscrupulous. A.B. is the oldest child; two of the brothers and sisters are slightly abnormal, nervously. But, so far as is known, none of the family has ever been sexually abnormal.

A.B. was a bright, intelligent child, though inclined to be melancholy (and in later years prone to self-analysis). At preparatory school was fairly forward in studies, at public school somewhat backward, at University suddenly took a liking to intellectual pursuits. Throughout he was slack at games. Has never been able to learn to swim from nervousness. Can whistle well. Has always been fond of reading, and would like to have been an author by profession. He married at 24, and has had two children, both of whom showed congenital physical abnormalities.

Before the age of 7 or 8 A.B. can remember various trifling incidents. "One of the games I used to play with my sister," he writes, "consisted in pretending we were 'father and mother' and were relieving ourselves at the w.c. We would squat down in various parts of the room, prolong the simulated act, and talk. I do not remember what our conversation was about, nor whether I had an erection. I used also to make water from a balcony into the garden, and in other unusual places.

"The first occasion on which I can recollect experiencing sensations or emotions similar in character to later and more developed feelings of desire was at the age of about 7 or 8, when I was a dayboy at a large school in a country town and absolutely innocent as to deed, thought, or knowledge. I fell in love with a

boy with whom I was brought in contact in my class, about my own age. I remember thinking him pretty. He paid me no attention. I had no distinct desire, except a wish to be near him, to touch him, and to kiss him. I blushed if I suddenly saw him, and thought of him when absent and speculated on my chances of seeing him again. I was put into a state of high ecstasy when he invited me to join him and some friends one summer evening in a game of rounders.

"At the age of 8 I was told by my father's groom where babies came from and how they were produced. (I already knew the difference in sexual organs, as my sister and I were bathed in the same room.) He told me no details about erection, semen, etc. Nor did he take any liberties with me. I used to notice him urinating; he used to push back the foreskin and I thought his penis large.

"When about 8 years old the nursemaid told me that the boy at her last place had intercourse with his sister. I thought it disgusting. About a year later I told the nurse I thought the story of Adam and Eve was not true and that when Eve gave Adam the apple he had intercourse with her and she was punished by having children. I don't know if I had thought this out, or if it had been suggested to me by others. This nurse used often to talk about my 'tassel.'

"A family of several brothers went to the same school with me, and we used to indulge in dirty stories, chiefly, however, of the w.c. type rather than sexual.

"When I was about 10 I learned much from my father's coachman. He used to talk about the girls he had had intercourse with, and how he would have liked this with my nursemaid.

"A year later I went to a large day school. I think most of the boys, if not nearly all, were very ignorant and innocent in sexual matters. The only incident in this connection I can recollect is asking a boy to let me see his penis; he did so.

"During the summer holidays, at a watering place I attended a theatrical performance and fell in love with a girl of about 12 who acted a part. I bought a photograph of her, which I kept and

kissed for several years after. About the same time I thought rather tenderly of a girl of my own age whose parents knew mine. I remember feeling that I should like to kiss her. Once I furtively touched her hair.

"When I was 12 I was sent to a small preparatory boarding school, in the country. During the holidays I used to talk about sexual things with my father's footman. He must have told me a good deal. I used to have erections. One evening, when I was in bed and everyone else out (my mother and the children in the country) he came up to my room and tried to put his hand on my penis. I had been thinking of sexual matters and had an erection. I resisted, but he persisted, and when he succeeded in touching me I gave in. He then proceeded to masturbate me. I sank back, overcome by the pleasant sensation. He then stopped and I went on myself. In the meantime he had taken out his penis and masturbated himself before me until the orgasm occurred. I was disgusted at the sight of his large organ and the semen. He then left me. I could hardly sleep from excitement. I felt I had been initiated into a great and delightful mystery.

"I at once fell into the habit of masturbation. It was some months before I could produce the orgasm; at about 13 a slight froth came; at about 14 a little semen. I do not know how frequently I did it--perhaps once or twice a week. I used to feel ashamed of myself afterward. I told the man I was doing it and he expressed surprise I had not known about it before he told me. He warned me to stop doing it or it would injure my health. I pretended later that I had stopped doing it.

"I practiced solitary masturbation for some months. At first the semen was small in amount and watery.

"I had not at this time ever succeeded in drawing the foreskin below the 'corona.' After masturbation I would sometimes feel local pain in the penis, sometimes pains in the testicles, and generally a feeling of shame, but not, I think, any lassitude. The shame was a vague sense of discomfort at having done what I knew others would regard as dirty. I also experienced fears that I was injuring my health.

"It was not long before I found other boys at the preparatory

school with whom I talked of sexual things and in some cases proceeded to acts. The boys were between the ages of 9 and 14; they left at 14 or 15 for the public schools. We slept in bedrooms--several in one room.

"There was no general conversation on sexual matters. Few of the boys knew anything about things--perhaps 7 or 8 out of 40. Before describing my experiences at the school I may mention that I cannot remember having at this period any wish to experience heterosexual intercourse; I knew as yet nothing of homosexual practices; and I did not have, except in one case, any love or affection for any of the boys.

"One night, in my bedroom--there were about six of us--we were talking till rather late. My recollection commences with being aware that all the boys were asleep except myself and one other, P. (the son of a clergyman), who was in a bed at exactly the opposite end of the room. I suppose we must have been talking about this sort of thing, for I vividly remember having an erection, and suddenly--as if by premonition--getting out of my bed, and, with heart beating, going softly over to P.'s bed. He exhibited no surprise at my presence; a few whispered words took place; I placed my hand on his penis, and found he had an erection. I started masturbating him, but he said he had just finished. I then suggested, getting into bed with him. (I had never heard at that time of such a thing being done, the idea arose spontaneously.) He said it was not safe, and placed his hand on my penis, I think with the object of satisfying and getting rid of me. He masturbated me till the orgasm occurred.

"I had no further relations with him, except on one occasion, shortly afterward, when one day, in the w.c. he asked me to masturbate him. I did so. He did not offer to do the same to me.

"He was a delicate, feeble boy; not good at work; womanish in his ways; inclined to go in for petty bullying, until a boy showed fight, when he discovered himself to be an arrant coward. Four or five years later I met him at the university. His greeting was cool. My next affair was with a boy who was about my age (13), strong, full-blooded, coarse, always in 'hot water.' He was the son of the headmaster of one of the best-known public schools. It was reported that two brothers had been expelled from this public

school for what we called 'beastliness.' He told me his older brother used to have intercrural intercourse with him. This was the first I had heard of this. We used to masturbate mutually. I had, however, no affection or desire for him.

"With E., another boy, I had no relations, but I remember him as the first person of the same sex for whom I experienced love. He was a small, fair, thin, and little boy, some two years younger than myself, so my inferior in the social hierarchy of a school.

"At the end of my last term I had two disappointments. I was beaten by a younger and clever boy for the first place in the school, and also beaten by one point in the competition for the Athletic Cup by a stronger boy who had only come to the school that very term. However, as a consolation prize, and as I was leaving, the headmaster gave me a second prize. This soothed my hurt feelings, and I remember, just after the 'head' had read out the prizes, on the last day of term, E., coming up to me, putting his arm on my shoulder, looking at me rather pensively, and in a voice that thrilled me and made me wish to kiss and hug him, tell me he was so glad I had got a prize and that it was a shame that other chap had beaten me for the cup.

"I was three years (aged 12 to 15) at the preparatory school. I started in the bottom form and ended second in the school. My reports were generally good, and I was keen to do well in work. I was considerably influenced by the 'head.' He was a clergyman, but a man of wide reading, broad opinion, great scholarship, and great enthusiasm. We became very friendly.

"During the holidays I now first practiced intercrural intercourse with a younger brother. I started touching his penis, and causing erections, when he was about 5. Afterward I got him to masturbate me and I masturbated him; I used to get him into bed with me. On one occasion I spontaneously (never having heard of such a thing) made him take my penis in his mouth.

"This went on for several years. When I was about 16 and he about 10, the old family nurse spoke to me about it. She told me he had complained of my doing it. I was in great fear that my parents might hear of it. I went to him; told him I was sorry, but I had not understood he disliked it, but that I would not do it again.

"About a year later (having persisted in this promise) I made overtures to him, but he refused. I then commended his conduct, and said I knew he was quite right, and begged him to refuse again if I should ever suggest it. I did not ever suggest it again. For many years I bitterly reproached myself for having corrupted him. However, I do not think any harm has been done him. But my self-reproaches have caused me to feel I owe some reparation to him. I also have more affection for him than for my other brothers and sisters.

"At the age of 15 I went to one of the large public schools. I was fairly forward for my age, and entered high. But I made small progress. I had bad reports; I was 'slack in games,' and not popular among the boys. In fact, I stood still, so that when I left I was backward in comparison with other boys of even less natural intelligence.

"The teaching was certainly bad. Moreover, I had not any friends, and this made me very sensitive. It was to a great extent my fault. When I first went there I was taken up by a set above me--boys who were 'senior' to me in standing. When they left I found myself alone.

"My unpopularity was increased by my being considered to put on 'side'; also because I paid attention to my dress.

"At the public school I had homosexual relations with various boys, usually without any passion. With one boy, however, I was deeply in love for over a year; I thought of him, dreamed of him, would have been content only to kiss him. But my courtship met with no success.

"When carrying on with other boys the desire to reach the crisis was not always strong, perhaps out of shyness or modesty. Occasionally I had intercrural connection, which gave me the first intimation of what intercourse with a woman was like. When I masturbated in solitude I used to continue till the orgasm.

"My housemaster one day sent for me and said he had walked through my cubicle and noticed a stain on the sheet. At this time I used to have nocturnal emissions. I cannot remember whether on

this occasion the stain was due to one, or to masturbation. But I imagined that one did not have 'wet dreams' unless one masturbated. So when he went on to say that this was a proof that I was immoral I acknowledged I masturbated. He then told me I would injure my health--possibly 'weaken my heart,' or 'send myself mad'; he said that he would ask me to promise never to do it again.

"I promised. I left humiliated and ashamed of myself; also generally frightened. He used to send for me every now and then, and ask me if I had kept my promise. For some months I did. Then I relapsed, and told him when he asked me. Ultimately he ceased sending for me--apparently convinced either that I was cured or that I was incorrigible.

"A year or so afterward he discovered in my study (for I was now in the upper school and had a study) a French photograph that a boy had given me, entitled '_Qui est dans ma chambre?_' It represented a man going by mistake into the wrong bedroom; inside the room was a woman, in nightdress, in an attitude that suggested she had just been relieving herself. My housemaster told me the picture was terribly indecent, and that, taken with what he knew of my habits, it showed I was not a safe boy to be in the school. He added that he did not wish to make trouble at home, but that he advised me to get my parents to remove me at the end of that term, instead of the following term, when, in the ordinary course of things, I should have left.

"I wrote to my people to say I was miserable at school, and I was removed at the end of that term.

"My first case of true heterosexual passion was with a girl called D., whom I first knew when she was about 16. My family and hers were friendly. My attraction to her soon became a matter of common knowledge and joking to members of my family. She was a dark, passionate-looking child, with large eyes that--to me--seemed full of an inner knowledge of sexual mysteries. Precocious, vain, jealous, untruthful--those were qualities in her that I myself soon recognized. But the very fact that she was not conventionally 'goody-goody' proved an attraction to me.

"I never openly made love to her, but I delighted to be near her.

Our ages were sufficiently separated for this to be noticeable. I dreamed of her, and my highest ideal of blessedness was to kiss her and tell her I loved her. I heard that she had been discovered talking indecently in a w.c. to some little boys, sons of a friend of my family's. The knowledge of this precocity on her part intensified my fascination for her.

"When I left home to return to school I kissed her--the only time. Absence did nothing to diminish my affection. I thought of her all day long, at work or at play. I wrote her a letter--not openly passionate, but my real feelings toward her must have been apparent. I found out afterward that her mother opened the letter.

"When I returned home for the holidays her mother asked me not to write her any letters and not to pay attentions to her, as I might 'spoil her.' I promised. I was, of course, greatly distressed.

"D. used to come to our house to see my younger sister. She had clearly been warned by her mother not to allow me to speak to her. I was too nervous to make any advances; besides, I had promised. As I grew older, my passion died out. I have hardly ever seen her since. She married some years ago. I still retain sentimental feelings toward her.

"I was now 18; I had stopped growing and was fairly broad and healthy. Intellectually I was rather precocious, though not ambitious. But I was no good at games, had no tastes for physical exercises, and no hobbies.

"During the holidays, in my last year at school, I had gone to the Royal Aquarium with a school companion. This was followed by one or two visits to the Empire Theatre. It was then that I first discovered that sexual intercourse took place outside the limits of married life. On one occasion my friend talked to one of the women who were walking about. This same friend spoke to a prostitute at Oxford. (At this time I went up to the university.) Once or twice I met this girl. She used to ask about my friend. My feelings toward her were a combination of admiration for her physical beauty, a sense of the 'mystery' of her life, and pity for her isolated position.

"On the whole, my first university term produced considerable improvement in me. I began to be interested in my work and to read a fair amount of general literature. I learned to bicycle and to row. I also made one intimate friend.

"In my first holiday I went to the Empire and made the acquaintance of a girl there, W.H. She attracted me by her quiet appearance. I eventually made arrangements to pay her a visit. My apprehensions consisted of: 1. Fear of catching venereal disease. This I decided to safeguard by using a 'French letter.' 2. Fear that she might have a 'bully.'

"The girl showed no sexual desire; but at that time this did not attract my attention.

"I got very much 'gone' on her, paid her several visits, gave her some presents I could ill afford, and felt very distressed when she informed me she was to be married and therefore could not see me any more.

"My experiences with prostitutes cover a period of twelve years. During three years of this period I was continually in their company. I have had intercourse with some two dozen; in some cases only once; in others on numerous occasions. They have usually been of the class that frequent Piccadilly, St. James Restaurant, the Continental Hotel, and the Dancing Clubs. Usual fee, £2 for the night; in one case, £5.

"1. Not one of them, as far as I knew, was a drunkard.

"2. As a rule, they were not mercenary or dishonest.

"3. In their language and general behavior they compared favorably with respectable women.

"4. I never caught venereal disease.

"5. I twice caught pediculi.

"6. I did not find them, as a rule, very sensual or fond of indecent talk. As a rule, they objected to stripping naked; they

did not touch my organs; they did not suggest masturbation, sodomy, or _fellatio_. They seldom exhibited transports, but the better among them seemed sentimental and affectionate.

"7. Their accounts of their first fall were nearly always the same. They got to know a 'gentleman,' often by his addressing them in the street; he took them about to dinners and theatres; they were quite innocent and even ignorant; on one occasion they drank too much; and before they knew what was happening they were no longer virgins. They do not, however, apparently round on the man or expose him or refuse to have anything more to do with him.

"8. They state--in common with the outwardly 'respectable' women whom I have had a chance of catechising--that before the first intercourse they did not feel any conscious desire for intercourse and hardly devoted any thought to it, that it was very painful the first time, and that some time elapsed before they commenced to derive pleasure from it or to experience the orgasm.

"E.B. was the second woman I had intercourse with. She was a prostitute, but very young (about 18) and had only been in London a few months. I met her first in the St. James Restaurant. I spoke a few words to her. The next day I saw her in the Burlington Arcade. I was not much attracted to her; she was pretty, in a coarse, buxom style; vulgar in manners, voice, and dress. She asked me to go home with her; I refused. She pressed me; I said I had no money. She still urged me, just to drive home with her and talk to her while she dressed for the evening. I consented. We drove to lodgings in Albany Street. We went in. She proceeded to kiss me. I remained cold, and told her again I had no money. She then said: 'That does not matter. You remind me of a boy I love. I want you to be my fancy boy.' I was flattered by this. I saw a good deal of her. She was sentimental. I never gave her any money. When I had some, she refused to take it, but allowed me to spend a little in buying her a present. On the night before I left London she wept. She wrote me illiterate, but affectionate letters. One day she wrote to me that she was to be kept by a man, but that she had made it a condition with him that she should be allowed to have me. I had never been in love with her, because of her vulgarity. I therefore took the earliest opportunity of letting matters cool, by not writing often, etc.

The next thing I remember was my fascination, a few months later, for S.H.

"She was not a regular prostitute. She had taken a very minor part in light opera. She was American by birth, young, slim, and spoke like a lady. Her hair was dyed; her breasts padded. She acted sentiment, but was less affectionate than E.B. I met her when she was out of a job. I gave her £2 whenever I met her. She was not mercenary. She was sensual. I became very much in love with her. I discovered her, however, writing letters to a fellow whom I had met one day when I was walking with her. He was only an acquaintance, but the brother of my most intimate friend. What I objected to was that in this letter to him she protested she did not care for me, but could not afford to give me up. She had to plead guilty, but I was so fascinated by her I still kept in with her, for a time, until she was kept by a man, and I had found other women to interest me.

"Owing to the strict regulations made by the university authorities, prostitutes find it hard to make a living there, and I never had anything to do with one. My adventures were among the shopgirl class, and were of a comparatively innocent nature. One of them, however, M.S., a very undemonstrative shopgirl, was the only girl not a prostitute with whom I had so far had intercourse.

"About this time I made the acquaintance of three other prostitutes, who, however, were nice, gentle, quiet girls, neither vulgar nor mercenary. A night passed with them always meant to me much more than mere intercourse. They were--especially two of them--of a sentimental nature, and would go to sleep in my arms. There was, on my part, not any passion, but a certain sympathy with them, and pity and affection. I remained faithful to the first, J.H., until she was kept by a man, and gave up her gentlemen friends. Then came D.V. She got in the family way and left London. Last, M.P. She was not pretty, but a good figure, well dressed, a bright conversationalist, and an intelligent mind. Her regular price for the night was £5, but when she got to know one she would take one for less and take one 'on tick.' She was very sensual. On one occasion, between 11 P.M. and about midday the following day I experienced the orgasm eleven or twelve times.

"During term time I was often prevented from having women by want of money and absence from London. I considered myself lucky if I could have a woman once or twice a month. My allowance was not large enough to admit of such luxuries; and I was only able to do what I did by being economical in my general expenditure and living, and by running up bills for whatever I could get on credit. I lived in the hopes of picking up 'amateurs' who would give me what I wanted for the love of it and without payment. My efforts were not very successful at present, except in the case of M.S. I considered myself very lucky in having discovered her, and I should have stuck to her for longer but for the rival attraction of another. There was, however, no deep sentiment on either side.

"But in order to preserve a continuity in my account of the women, I have left out two cases of temporary reversion to homosexual practices. During the periods when I could not get a woman I had recourse once more to masturbation. At times I had 'wet dreams' in which boys figured; and my thoughts, in waking hours, sometimes reverted to memories of my school experiences. I think, however, that I should have preferred a woman."

The homosexual reversions were as follows:--

"1. I had arranged to meet a shopgirl one evening, outside the town. She did not turn up. The meeting place was a railway bridge. Waiting there too, a few feet from me, was a boy of about 15. He was employed (I afterward found) by a gardener, and was waiting to meet his brother, who was engaged on the line. I got into casual conversation with him, and suddenly found myself wondering whether he ever masturbated. With a feeling, that I can only describe by calling it an intuition, I moved nearer him, and asked: 'Do you ever play with yourself?' He did not seem surprised at the abruptness of my question, and answered 'yes.' I thereupon touched his penis, and _found he had an erection_! I suggested retiring to a bench that was near. We sat down. I masturbated him till he experienced the orgasm; then intercrurally. I gave him a shilling, and said good night.

"2. During my last summer at the university I took to gardening. There was a small piece of garden behind the house in which I had

lodgings. My landlady suggested getting a cousin of hers, employed by a nurseryman, to supply me with plants, etc. He was a youth of about 16 or 17, tall, dark, not bad favored in looks. I forget how many times I saw him--not many, perhaps twice or thrice; but one day, when he came to see me in my room, about something connected with the garden, I gave him some old clothes of mine. He was a great deal taller than myself, and I suggested his trying on the trousers to see if they would fit. I do not know whether I made this suggestion with any ulterior motive or whether I had ever before thought of him in connection with any sexual relations. I only know that once more, as if guided by instinct, I felt he would not rebuff me, although certainly no indecent talk had ever taken place between us. I pretended to help him to pull up the trousers, and let my hand touch his penis. He did not resist; and I felt his penis for a few seconds. I then proposed he should come upstairs to my bedroom. No one was in the house. We went up. He did not at first have an erection. I asked why. He said 'because you are strange to me.' He then felt my penis. Eventually we mutually masturbated one another. I gave him half a crown.

"Some short time afterward he came again to the house. On this occasion I attempted _fellatio_. I don't think I had at that time ever heard of such a practice. He said, however, he did not like it. He masturbated intercrurally. He said he had never done this before, although he had had girls. (The other boy also told me he had had girls.)

"3. On another occasion I was out bicycling. A boy, of about 10 years of age, offered me a bunch of violets for a penny. I told him I would give him a shilling to pick me a large bunch. I am not sure if I had any ulterior motive. He proceeded into a wood on the side of the road; I dismounted from my machine and followed him. He was a pretty, dark boy. He made water. I went up to him and asked him to let me feel his penis. He at once jumped away, and ran off shrieking. I was frightened, mounted my bicycle, and rode as fast as I could home.

"There was no sentiment in the above cases. It is also to be noted that in neither instance did I make any arrangements to see the person again. As far as I can remember, when once I was satisfied I felt disgust for my act. In the case of women this

was never so.

"Two of the women described in the foregoing pages stand out above the others. Perhaps I have not sufficiently shown that in the cases of W.H. and S.H. I felt a considerable degree of passion. W.H. was the first woman with whom I had had intercourse; this invested her in my heart, with a peculiar sentiment. In neither case can I be accused of fickleness. Indeed, I may say that up to this time I had had no opportunity of being fickle. I never saw enough, or had enough, of a woman to get a surfeit of her.

"The case I now come to presents the features of the cases of W.H. and S.H. in a stronger form. I was then 20; I have since then married; I am a father; my experiences have been many and varied; but still I must confess that no other woman has ever stirred my emotions more than--I doubt if as much as--D.C. Up to date, if there has been any grand passion in my life, it is my love for her. D.C., when I got to know her--by talking to her in the street--was a girl of about 20. She was short and plump; dark hair; dark, mischievous eyes; a fair complexion; small features; quiet manners, and a sensual ensemble. I do not know what her father was. He was dead, her mother kept a university lodging house. She spoke and behaved like a lady. She dressed quietly; was absolutely unmercenary; her intelligence--i.e., her intellectual calibre--was not great. Her master-passion was one thing. The first evening I walked out with her she put her hand down on my penis, before I had even kissed her, and proposed intercourse. I was surprised, almost embarrassed; she herself led me to a wall, and standing up made me do it.

"Next day we went away for the day together. I may say she was always ready and never satisfied. She was sensual rather than sentimental. She was ready to shower her favors anywhere and to anyone. My feelings toward her soon became affectionate and sentimental, and then passionate. I thought of nothing else all day long; wrote her long letters daily; simply lived to see her.

"I found she was engaged to be married. Her fiancé, a schoolmaster, himself used to have intercourse with her, but he had taken a religious turn and thought it was wicked to do it until they married. I had intercourse with her on every possible

occasion: in private rooms at hotels, in railway carriages, in a field, against a wall, and--when the holidays came--she stayed a night with me in London. She had apparently no fear of getting in the family way, and never used any precaution. Sensual as she was, she did not show her feelings by outward demonstration.

"On one occasion she proposed _fellatio_. She said she had done it to her _fiancé_ and liked it. This is the only case I have known of a woman wishing to do it for the love of it.

"The emotional tension on my nerves--the continual jealousy I was in, the knowledge that before long she would marry and we must part--eventually caused me to get ill. She never told me she loved me more than any other man; yet, owing to my importunity, she saw much more of me than anyone else. It came to the ears of her _fiancé_ that she was in my company a great deal; there was a meeting of the three of us--convened at his wish--at which she had formally, before him, to say 'good-bye' to me. Yet we still continued to meet and to have intercourse.

"Then the date of her marriage drew near. She wrote me saying that she could not see me any more. I forced myself, however, on her, and our relations still continued. Her elder sister interviewed me and said she would inform the authorities unless I gave her up; a brother, too, came to see me and made a row.

"I had what I seriously intended to be a last meeting with her. But after that she came up to London to see me, we went to a hotel together. We arranged to see one another again, but she did not write. I had now left the university. I heard she was married.

"It was now four years since I had first had intercourse with a woman. During this time I was almost continually under the influence, either of a definite love affair or of a general lasciviousness and desire for intercourse with women. My character and life were naturally affected by this. My studies were interfered with; I had become extravagant and had run into debt. It is worthy of note that I had never up to this time considered the desirability of marriage. This was perhaps chiefly because I had no means to marry. But even in the midst of my affairs I always retained sufficient sense to criticise the moral

and intellectual calibre of the women I loved, and I held strong views on the advisability of mental and moral sympathies and congenial tastes existing between people who married. In my amours I had hitherto found no intellectual equality or sympathies. My passion for D.C. was prompted by (1) the bond that sexual intercourse with a woman has nearly always produced in my feelings, (2) her physical beauty, (3) that she was sensual, (4) that she was a lady, (5) that she was young, (6) that she was not mercenary. It was kept alive by the obstacles in the way of my seeing her enough and by her engagement to another.

"The D.C. affair left me worn out emotionally. I reviewed my life of the last four years. It seemed to show much more heartache, anxiety, and suffering than pleasure. I concluded that this unsatisfactory result was inseparable from the pursuit of illegitimate amours. I saw that my work had been interfered with, and that I was in debt, owing to the same cause. Yet I felt that I could never do without a woman. In this quandary I found myself thinking that marriage was the only salvation for me. Then I should always have a woman by me. I was sufficiently sensible to know that unless there were congenial tastes and sympathies, a marriage could not turn out happily, especially as my chief interests in life (after woman) were literature, history, and philosophy. But I imagined that if I could find a girl who would satisfy the condition of being an intellectual companion to me, all my troubles would be over; my sexual desire would be satisfied, and I could devote myself to work.

"In this frame of mind I turned my thoughts more seriously in the direction of a girl whom I had known for some two years. Her age was nearly the same as mine. My family and hers were acquainted with one another. I had established a platonic friendship with her. Undoubtedly the prime attraction was that she was young and pretty. But she was also a girl of considerable character. Without being as well educated as I was, she was above the average girl in general intelligence. She was fond of reading; books formed our chief subject of conversation and common interest. She was, in fact, a girl of more intelligence than I had yet encountered. On her side, as I afterward discovered, the interest in me was less purely platonic. Our relations toward one another were absolutely correct. Yet we were intimate, informal, and talked on subjects that would be considered forbidden topics

between two young persons by most people. I felt she was a true friend. She, too, confided to me her troubles.

"We corresponded with one another frequently. Sometimes it occurred, to me that it was rather strange she should be so keen to write to me, to hear from me, and to see me; but I had never thought of her, consciously, except as a friend; I never for a moment imagined she thought of me except as an interesting and intelligent friend. Nor did the idea of illicit love ever suggest itself to me. She was one of those women whose face and expression put aside any such thought. I was, indeed, inclined to regard her as a good influence on me, but as passionless. I confided to her the affair of D.C., which took place during our acquaintance. She was distressed, but sympathetic and not prudish. I did not suspect the cause of her distress; I thought it was owing to her disappointment in the ideals she had formed of me. She invited me to join her and her family for a part of the summer (I had now left the university, having obtained my degree in low honors) and I decided to join them. At this stage there began to impress itself on my mind the possibility that she cared for me; also the desirability, if that were so, of becoming engaged to her. I found my feelings became warmer. On several occasions we found ourselves alone. Then, one day, our talk became more personal, more tender; and I kissed her. I do recollect distinctly the thought flashing through my mind, as she allowed me to kiss her, that she was not after all the passionless and 'straight' girl I had thought. But the idea must have been a very temporary one; it did not return; she declared her love for me; and without any express 'proposal' on my part we walked home that afternoon mutually taking it for granted that we were engaged. I was happy, and calmly happy; proud and elated.

"Circumstances now made it necessary for me to make money for myself and I was forced to enter a profession for which I had never felt any attraction; indeed, I had never considered the possibility of it, until I became engaged, and saw I must support myself if I were ever to marry. I worked hard, and rapidly improved my position.

"I think I am correct in stating that from the day I became engaged my sexual troubles seemed to have ceased. My thoughts and passions were centred on one woman. We wrote to one another

twice every week, and as far as I was concerned every thought and feeling I had I told her, and the receipt of her letters was for me the event of my life for nearly three years. My anxiety in connection with my work used up a great deal of my energy, and, although I looked forward to the time when I should have a woman at my side every night, my sexual desires were in abeyance. Nor did I feel any desire or temptation for other women.

"I masturbated, but not frequently. Generally I did it to the accompaniment of images or scenes associated with my betrothed, sometimes the act was purely auto-erotic. My leisure time was devoted to reading.

"On only one occasion did I have intercourse with a woman during my engagement (three years); it was with a girl whose acquaintance I had made at the university and who asked me to come to see her.

"I married at the age of 24. Looking back on the early days of my married life it is now a matter of surprise to me that I was so far from exhibiting the transports of passion which since then have accompanied any intercourse with a new woman. Partly I was frightened of shocking her; partly my three years of comparative abstinence had chastened me. It was some weeks before I ever saw my wife entirely naked; I never touched her parts with my hand for many months; and after the first few weeks I did not have intercourse with her frequently.

"Perhaps this was to be expected. The basis of my affection for her had always been a moral or mental one rather than physical, although she was a handsome, well-made girl. Besides, money and other worries kept my thoughts busy, as well as struggles to make both ends meet.

"Indeed, I may say my sexual nature seemed to be dying out. When I had been married less than six months I discovered that sexual intercourse with my wife no longer meant what sexual intercourse used to mean--no excitement or exaltation or ecstasy. My wife perhaps contributed to this by her attitude. She confessed afterward to me that for the first week or so she positively dreaded bedtime, so physically painful was intercourse to her; that it was many weeks, if not months, before she experienced the

orgasm. For the first year and more of marriage she could not endure touching my penis. This at first disappointed me; then annoyed and finally almost disgusted me.

"Later on, she learned to experience the orgasm. But she was very undemonstrative during the act, and it was seldom that the orgasm occurred simultaneously; she took a much longer time.

"I ceased to think about sexual matters. When I had been married about three years I was aware that, in my case, marriage meant the loss of all mad ecstasy in the act. I knew that if I had no work to do, and plenty of money, and temptation came my way, I should like to have another woman. But there was no particular woman to enchain my fancy and I did not have time or money or inclination to hunt for one.

"At times I masturbated. Sometimes I did this to the accompaniment of homosexual desires or memories of the past. Then I got my wife to masturbate me.

"About four years after marriage I got a woman from Piccadilly Circus to do _fellatio_. I had never had this done before. She did not do it genuinely, but used her fingers.

"As stated above various anxieties, the fact that I could always satisfy my physical desires, all served to calm me. I was also interested in my work and had become ambitious to improve my position and was very energetic.

"On the whole, notwithstanding money worries, the first four or five years of my married life were the happiest in my life. Certainly I was very free from sexual desires; and the general effect of marriage was to make me economical, energetic, ambitious, and unselfish. I was certainly overworked. I seldom got to bed before 1 or 2; my meals were irregular; and I became worried and nervous. At the beginning of my fifth year of married life I got run down, and had a severe illness, and at one time my life was in danger, but I had a fairly rapid convalescence.

"My illness was critical, in more senses than one. My convalescence was accompanied by a remarkable recrudescence of my sexual feelings. I will trace this in detail: 1. As I got

well--but while still in bed--I found myself experiencing, almost continually, violent erections. These were at first of an auto-erotic character, and I masturbated myself, thus gaining relief to my nerves. 2. I also found my thoughts tending toward sexual images, and I felt a desire toward my nurse. I first became conscious of this when I noticed that I experienced an erection during the time that she was washing me. I mentioned the matter to my doctor, who told me not to worry, and said the symptoms were usual in the circumstances. 3. When I got up and about I found myself desiring very keenly to have intercourse with my wife. I can almost say that I felt more sexually excited than I had done for four or five years. As soon, however, as I had had intercourse with my wife a few times I felt my desire toward her cease. 4. My thoughts now centered on having a woman to do _fellatio_, and as soon as I was well enough to go out I got a prostitute to do this.

"Just before I was ill my wife had a child, which was born with more than one abnormality. No doubt the shock and worry caused by this got me into a low state and predisposed me to my illness. But the consequences were farther reaching still. The child underwent an operation, and my wife had to take her away into the country for nearly six weeks, so as to give her better air. I was left alone in London, for the first time since my marriage. The worry in connection with the child, and the heavy expense, served to keep me nervously upset after I had apparently recovered physically from the illness. Once more I found myself thinking about women. As an additional factor in the situation I became friendly with an old college-chum whom I had not seen much of for many years. He lived the life of a fashionable young bachelor and was at the time keeping a woman. The only common interest between us was women. I found myself reverting to the old condition of rampant lust that had been such a curse to me in my university days. Some books he lent me had a decided effect. They gave me erections; and it was on top of the excitement thus engendered that one day I got a woman to do _fellatio_, as already mentioned. Moreover, since my illness, I found all my previous energy and ambition had gone.

"I have stated that I was in London alone with two servants. The housemaid was a young girl; nice looking, with beautiful eyes and a sensual expression. She had been with us for about a year. I

cannot remember when I first thought of her in a sexual way. But one evening I suddenly felt a desire for her. I talked to her; I found my voice trembling; I let my hand, as if by accident, touch hers; she did not withdraw it; and in a second I had kissed her. She did not resist. I took her on my knee, and tried to take liberties, which she resisted, and I desisted.

"Next day I kissed her again, and put my hand inside her breasts. The same evening I took her to an exhibition. On the way home, in a hansom cab, I made her masturbate me. This was followed by a feeling of great relief, elation, and pride.

"Next morning, when she came up to my bedroom to call me, I kissed and embraced her; she allowed me to take liberties, and, reassuring her by saying I would use a preventive, I had intercourse with her. She flinched somewhat. She then told me she was at her period and that she had never had intercourse with a man before.

"During the next few weeks I found her an adept pupil, though always shy and undemonstrative. I took her to a hotel, and experienced the intensest pleasure I had ever had in undressing her. I had lately heard about cunnilingus. I now did it to her. I soon found I experienced very great pleasure in this, as did she. (I had attempted it with my wife, but found it disgusted me.) I also had intercourse per anum. (This again was an act I had heard about, but had never been able to regard as pleasurable. But books I had been reading stated it was most pleasant both to man and woman.) She resisted at first, finding it hurt her much; it excited me greatly; and when I had done it in this way several times she herself seemed to like it, especially if I kept my hand on her clitoris at the same time.

"My relations with the housemaid, with whom I cannot pretend that I was in love, were only put an end to by satiety, and when I went away for my holidays I was utterly exhausted. This was, however, only the first of a series of relationships, at least one of which deeply stirred my emotional nature. These experiences, however, it is unnecessary to detail. There have also been occasional homosexual episodes.

"I think I am now in a much healthier condition than I have been

for some years. (I assume that it is not healthy for all one's thoughts to be always occupied on sexual subjects.) The conclusion I come to is that I can live a normal, healthy life, devoting my thoughts to my work, and finding pleasure in friendship, in my children, in reading, and in other sources of amusement, as long as I can have occasional relations with a young girl--i.e., about once a week. But if this outlet for my sexual emotions is stopped sexual thoughts obsess my brain; I become both useless and miserable.

"I have never regretted my marriage. Not only do I feel that life without a wife and home and children would be miserable, but I entertain feelings of great affection toward my wife. We are well suited to one another; she is a woman of character and intelligence; she looks after my home well, is a sensible and devoted mother, and understands me. I have never met a woman I would have sooner married. We have many tastes and likings in common, and--what is not possible with most women--I can, as a rule, speak to her about my feelings and find a listener who understands.

"On the other hand, all passion and sentiment have died out. It seems to me that this is inevitable. Perhaps it is a good thing this should be so. If men and women remained in the state of erotic excitement they are in when they marry, the business and work of the world would go hang. Unfortunately, in my case this very erotic excitement is the chief thing in life that appeals to me!

"The factors that in my case have produced this death of passion and sentiment are as follows:--

"1. Familiarity. When one is continually in the company of a person all novelty dies out. In the case of husband and wife, the husband sees his wife every day; at all times and seasons; dressed, undressed; ill; good tempered, bad tempered. He sees her wash and perform other functions; he sees her naked whenever he likes; he can have intercourse with her whenever he feels inclined. How can love (as I use the expression--i.e., sexual passion) continue?

"2. Satiation. I am of a 'hot,' sensual disposition, inclined to

excess, as far as my health and nerves are concerned. The appetite gets jaded.

"3. Absence of strong sexual reciprocity on the part of my wife. I have referred to this above. She likes intercourse, but she is never outwardly demonstrative. She has naturally a chaste mind. She never is guilty of those little indecencies which affect some men a great deal. She does not like talking of these things; and she tells me that if I died, she would never want to have intercourse again with anyone. At times, especially recently, she has even asked me to have intercourse with her, or to masturbate her; but it is seldom that the orgasm occurs contemporaneously. In this respect she is different from other women I knew, in whom the mere fact that the orgasm was occurring in me at once produced it in them. At the same time I doubt whether even strong sexual reciprocity would have retained my passion for long.

"4. During the early years of our married life money worries caused at times disagreements, reproaches and quarrels. Passion and sentiment are fragile and cannot stand these things.

"5. The fact that I had already had other women diminished the feeling of awe with which many regard the sexual act and the violation of sexual conventions.

"6. Loss of beauty. Loss of figure is, I fear, inseparable from childbearing especially if the woman works hard. We have always had servants, still my wife has always worked hard, at sewing, etc.

"I have stated that I entertain feelings of respect and admiration for my wife. But I almost _loathe_ the idea of intercourse with her. I would sooner masturbate, and think of another woman than have intercourse with her. It causes nausea in me to touch her private parts. Yet with other women it affords me mad pleasure to kiss them, every part of their bodies. But my wife still feels for me the love she had when we first married. There lies the tragedy."

The following narrative is a continuation of History XII in the previous volume:--

HISTORY III.--I had become good looking. For a time I knew what it was to have loving looks from every woman I met, and being saner and healthier I would seem to be moving in a divine atmosphere of color and fragrance, pearly teeth and bright eyes. Even the old women with daughters looked at me amiably--married women with challenge and maidens with Paradise in their eyes.

"I was standing one morning at St. Peter's corner, with two young friends, when a girl went by, coming over from the Roman Catholic cathedral. When she had passed she looked back, with that imperious swing that is almost a command, at me, as my friends distinctly admitted. They advised me to follow her; I did so, and she turned a pretty, blushing face and pair of dark gray eyes, with just the kind of eyebrows I liked: brown, very level, rather thick, but long. Her teeth and mouth were perfect, and she spoke with a slight Irish brogue. She let me do all the talking while she took my measure. God knows what she saw in me! I spoke in an affected manner, I remember, imitating some swell character I had seen on the stage a night or two before, but I was wise enough not to talk too much and to behave myself. She promised to meet me again and made the appointment. She was a school-teacher and engaged to be married to some one else. She meant to amuse herself her own way before she married. The second night I met her she allowed me to kiss her as much as I liked and promised all her favors for the third night. We took a long walk, and in the dark she gave herself to me, but I hurt her so much I had to stop two or three times. She had had connection only once, years before, when at school herself. She was inclined to be sensual, but she was young, fresh, and pretty, and her kisses turned my head. I fell genuinely in love with her and told her so, one night when she was particularly fascinating, with the tears in my eyes; and her face met mine with equal love. The first night or two I had felt no pleasure--whether through years of self-abuse or not I do not know,--but this night my whole being was excited. I met her once and sometimes twice a week and was always thinking of her. My sister saw me looking love-sick one day and I heard her say 'He's in love,' which rather flattered me, and I looked more love-sick and idiotic than ever. It was all wrong and perverted. She continued to meet her fiancé, and intended to marry him. We both spoke of 'him' as an adultress speaks of her husband. That high level of tears and childlike joy in our youth and love was never reached again. But I realized her sex, her

kisses, her presence--after all those years of horror (if she had only known)--more even than the sexual act itself; while she, as time went on, commenced to show a curiosity which I thought desecrating; she liked to examine--to 'let her hand stray,' were her words. Even her beauty seemed impaired some nights and I caught a gleam in her eye and a curve of her lip I thought vulgar. But perhaps the next night I met her she would be as bright as ever.

"I introduced her to my friends, who knew our relations, for I blabbed everything. But she did not mind their knowing and if we met would give them all a kiss, so that I felt I had been rather too profuse in my hospitality, though I still would say: 'Have another one, Bert; I don't mind.' But whatever ass I made of myself she forgave me anything, and was fonder of me every time we met, while I, although I did not know it for a long time, was less fond of her. She knew how to revive my love, however. Some nights she would not meet me, and I would be like a madman. Other nights she would meet me, but not let me raise her dress. She would lie on me, on a moonlit night, and her young face in shadow like a siren's in its frame of hair, merely to kiss me. But what kisses! Slow, cold kisses changing to clinging, passionate ones. She would leave my mouth to look around, as if frightened, and come back, open-mouthed, with a side-contact of lips that brought out unexpected felicities.

"One night her fiancé saw us together, and followed me after I left her, but on turning a corner I ran. I ridiculed him to her and despised him. I should have found it difficult to say why. Another night her brother attacked me, and it would have gone hard with me, but Annie pulled me in and banged the door. We were in a friend's house, but her father came around soon and laid a stick about her shoulders, in my presence. I tried to talk big, and said something idiotic about being as good a man as her betrothed, as though my intentions were honorable, which for one brief moment made Anne look at me, paler faced and changed, such a strange glance. But he beat her home, enjoying my rage, and she went away, crying in her hands. I was allowed to go unmolested.

"I soon received a letter from her asking me not to mind and making an appointment, at which she turned up cheerful and unconcerned. She went to confession, and would meet me

afterwards; and her faith in that, and the difference of our religions (if I had any religion) would make her seem strange and alien to me at times, even banal. At last our meetings became a mere habit of sensuality, with all charm, and suggestion of better things eliminated....

"I went with my friend George (who shared my room) one afternoon and called at Annie's school; she kept an infants' school of her own. She came to the door herself. It was the first time I had seen her in daylight, and I thought her cheek-bones bigger; she certainly was not so pretty as on the first evening I met her. George had told me he would sleep away if I wanted the room, and when next I met her she promised to come and sleep with me. Before I had always met her on the grass, under trees. She came, and the sight of her young limbs and breasts revived something of my love for her, my better love. But she was insatiable and more sensual every day. One day she came when I was not well, and would not go away disappointed. I had met a very pretty girl about this time, and now resolved to give Annie up, which I did in the cruelest manner, cutting her dead, and refusing to answer her letters and touching messages. I heard that she would cry for hours, but I was harder than adamant....

"I thought myself very much in love with the very pretty girl for whom I had thrown up Annie. She lived with her mother and two sisters, one older than herself, the other a mere child. The eldest sister, a handsome, dark girl like a Spaniard, was not virtuous. She was good natured; too much so, and took her pleasure with several of us, dying, not long after, of consumption. I thought her sister, my girl, was virtuous, and I meant to marry her--some day. At any rate, I saw her mother, who lived in a well-furnished house and was a superior woman. This did not prevent my trying to seduce her daughter. I did not succeed for a long time, though she did not cease meeting me. The sisters came to see us. I knew, one night, her sister was upstairs with D. and I guessed what they were at, so I suggested to her she should creep up on them for fun. She did so, came back, excited and pale--and gave herself to me. But she was not a virgin and in time I had a glimpse of her unhappy fate and her mother's position. Her father was dead or divorced, and her mother, I believe, was mistress to some wealthy bookmaker. I am not sure, there was always a mystery hanging over the mother, nor

am I certain that she connived at her daughter's seduction, but the girl's account was that after some successful Cup day there had been too much champagne drunk all around, and that a man she looked on as a friend came into her bedroom that night when she was tête montée and seduced or violated her--whichever word you like to choose. Since then his visits had been frequent until she met me, she said, and if I would be true to her she would be a true wife to me, and I believed her and still believe she meant what she said. But I left Melbourne shortly after this, our letters got few and far between, and ultimately I heard she was married to a young man who had always been in love with her....

"Among the inmates of the boarding house was a 'married' couple who stayed for some time; he was an insignificant, ugly, little, crosseyed commercial traveler; she was a pretty, little creature who looked as innocent and was as merry as a child; we all vied in paying her attentions and waiting on her like slaves, the husband always smiling a cryptic smile. After they had left it was hinted they were not married at all; the oldest hands had been taken in.... One afternoon I met Dolly, the commercial traveler's wife, and she stopped and spoke to me. I remembered what I had heard and ventured on some pleasantry at which she laughed, and on my proposing that we should go for a walk she consented. She had left the commercial traveler, it came out in conversation, and we went on talking and walking, one idea only in my mind now; could I detain her till dark? Dolly, who was very pretty indeed, amused herself with me for hours, playing hot and cold, snubbing me one minute, encouraging me with her eyed another. Hour after hour went and she found this game so entertaining that she accompanied me to the park behind the Botanical Gardens, and it was not until it was too late for me to catch a train home that she gave herself to me. In fact, we stayed out the whole of that warm summer night. As the hours went by she told me of her home in London and how she first went wrong. She had been a good girl till one day on an excursion she drank some rum or gin, which seemingly revived some dormant taint of heritage; when she went home that night she fell flat at her mother's feet. Her parents, well-to-do shopkeepers, who had forgiven her several times before, turned her out. She became one man's mistress and then another's. She began early, and was scarcely 19 now. She would leave off the drink for a time and try to be respectable. She loved her father and mother, but she could

not help drinking at times. She spoke cheerfully and laughingly about it all; she was young, strong, good natured, and careless. We went to sleep for a little while and then wandered in the early morning down toward the cemetery, when she tried to tidy her hair, asking me how I had enjoyed myself and not waiting for an answer. She was thirsty, she said, and when the public houses opened we went and had a drink. It was the first time I had seen her drink alcohol,--at the boarding house she had always been the picture of health and sweetness,--and I saw a change come over her at once, so that I understood all that she had told me. The sleepless night may have made it worse, but the look that came into her eyes, and the looseness of the fibres not only of her tell-tale wet mouth, but of every muscle of her face was startling and piteous to see. She saw my look and laughed, but her laugh was equally piteous to hear, and when she spoke again her voice had changed too, and was equally piteous. She asked for another. 'No, don't,' I begged, for the pretty girl I had flattered myself I had passed a summer's night with that most young men would envy, showed signs of changing, like some siren, into a flabby, blear-eyed boozier. That hurt my vanity.

"I met her another night and she took, me to her lodgings, and I slept with her all night. I no longer tried to stop her drinking, but drank with her. I ceased to treat her with courtesy and gallantry; she noticed it, but only drank the more, drank till she became dirty in her ways, till her good looks vanished. I left her, too drunk to stand, as some friend, a woman, called on her.

"She came to see me once more, like her old self, so well dressed and well behaved, and chatted so cheerfully to my landlady that the latter afterward congratulated me on having such a friend. Dolly carried a parcel of underclothing she had made, with a few toys, for the children of a poor man in the suburbs, and I accompanied her to the house. There was great excitement among the ragged children; in fact, the atmosphere became so dangerously full of love and charity that I commenced to feel uncomfortable,--the shower of roses again,--and was glad to find myself in the open air. We went for a walk and had several drinks, which made the usual change in Dolly. I got tired of her, determined I would leave her, spoke cruelly, and finally--after having connection with her on the dry seaweed--rose and left her

brutally, walked away faster and faster, deaf to her remonstrances, and careless whether or how she reached the station....

"I had gone to lodge with a family whom I had been accustomed to visit as a friend; there were two daughters; the elder, engaged to a young German who was away with a survey party, had a rather plain face, but a strong one and was herself a strong character, and I came to like her in spite of myself; the second girl had light golden hair, a fresh complexion, a short nose, and rather large mouth, which contained beautiful teeth; they were both good, obedient, innocent church-going daughters. As there was plenty of amusement there of an evening, singing and dancing, I did not go out, got into better ways, and gradually gave up drinking to excess. I was so improved in appearance that an old acquaintance did not recognize me. My anecdotes and fun amused Mrs. S., the mother of the girls. She could be very violent on occasions, I found, and I learned that there had been terrible scenes at times, and that from time to time it had been necessary to place her in an asylum. I went for drives with the girls and to theatres, and ought to have been happy and glad to find myself in such good quarters. The mother trusted me so entirely that she left me for hours with the girls, the younger one of whom I would kiss sometimes. She was engaged to a young fellow whom I spoke to patronizingly, but whose shoes I was not worthy to fasten. I was the cause of quarrels between them. They made it up again but I think he noticed the change that was taking place in Alice. For from kissing her I had gone on--all larking at first. We formed the habit of sitting down on the sofa when alone and kissing steadily for ten minutes or more at a time. She was excited without knowing what was the matter with her--but I knew. And one day when our mouths were together I drew her to me and commenced to stroke her legs gently down. She trembled like a string bow, and allowed my hand to go farther. And then she was frightened and ashamed and commenced to laugh and cry together. She had these hysterical attacks several times and they always frightened me. It ended in my seducing her. She broke off her engagement, and then was sorry; but soon she thought only of me.... One day Alice and I were nearly caught. I had just left her on the sofa and had commenced drawing at a table with my back to her when suddenly her mother came in without her shoes, while Alice had one hand up her clothes arranging her underclothing. The mother

stopped dead and shot me one glance I shall never forget. 'Why, Alice, you frighten me!' she said. I feigned surprise and asked 'What is the matter?' Alice, although she was frightened out of her wits, managed to stammer: 'He couldn't see me--you couldn't see me, could you?' appealing to me. But I had managed to collect my senses a bit and although still under that maternal eye I asked,--at last turning slowly around to Alice: 'See? What do you mean? See what?' And I looked so mystified that the mother was deceived, and contented herself with scolding Alice and telling her to run no risks of that sort. I breathed again.

"But I was near the end of my tether. Alice and I talked about everything now. She told me about her life at boarding school and the strange ideas some of the girls had about men and marriage. After leaving school she had been sent to a large millinery or drapery establishment to learn sewing and dressmaking. Here, she said, the talk was awful at times, and one girl had a book with pictures of men's organs of generation, which was passed around and excited their curiosity to the highest pitch.

"I had days of tenderness and contrition, and even told her I would get on and marry her. Then the tears would come into her eyes and she would say: 'I seem to feel as if you were my husband now.' ...

"I had to see a man on business and went to his cottage. The door was opened by his wife, a handsome, dark-eyed young woman, who looked as if butter would not melt in her mouth. After leaving a message I went on talking to her on other subjects. She piqued my vanity in some way, and made me feel curious and restless. I found myself thinking of her after I left and looking back I saw she was still looking at me.

"To make a long story short, she encouraged me. It ended by my leaving the S. family and going to board with them. T.D., the husband, was glad of my company and my money. They had a little boy--whose father T. was not. I soon understood her inviting looks at me. For she was a general lover, and an old man, in a good government billet, visited her often when T.D. was away: I will call him Silenus. There was also a dark, handsome man who built organs. The latter came one day and sent for some beer. I was working in my room, and it so happened that before he knocked

she had been going further than usual in her talk with me; in fact, as good as giving me the word. When her friend was admitted he had to pass my open door and he gave me a look with his black eyes and I gave him a look which told each what the other's game was. It is wonderful what a lot can be learned from a single glance of the eyes. When I saw the little boy bringing in the beer I felt that he had bested me. But she brought me in a glass first, and putting her down on the sofa I scored first. It was done so suddenly, so brutally, that, accustomed as she must have been to such scenes she turned red and bit her under lip. But she sent the other man away in a few minutes. After that she was insatiable; it was every day and sometimes twice in one day. I commenced to be gloomy and miserable again. And there was not even a pretense of love. There was no deception about her; she even introduced me to Silenus and we made excursions together, for which he paid, as he had plenty of money. We were always drinking, until at last I could eat nothing unless I had two or three whiskies. I became very thin, my horizon seemed black and all things at an end. (But T.D. enjoyed his meals and was really fond of his wife and her boy and his work; life was pleasant to him.) She would go up to town with me and to a certain hotel; after drinking she would leave me waiting while she retired with the handsome young landlord for a short time. She told me when she came back that he was a great favorite with married women.

"She told me that Silenus visited a woman who practiced _fellatio_ on him. Mrs. D. thought such practices abominable and could not imagine how a woman could like doing such a thing.

"When she was out walking with me one day T.D.'s name came up and she said in a slightly altered voice: 'He told me he loved me!' It was a word seldom used by her except in jest. I threw a startled look at her and caught an inquisitive and apologetic look in return, such a strange and touching glance that I saw I had not yet understood her,--there was an enigma somewhere. When, bit by bit, she told me her life, I understood, or thought I understood, that strange childlike glance in this young woman steeped to her eyes in sin. No one had ever made love to her or spoken to her of love in her life.

"It had commenced at school. She must have been a particularly fine and handsome girl, judging from her photographs. She had

seen boys playing with girls' privates under the form and felt jealous that they did not play with her's. She had no mother to look after her and she soon found plenty of boys to play with her, and young men, too, as she grew older. She took it as she took her meals. She had been really fond of her child's father, but as he had shown no tenderness for her, nothing but a craving for sensual gratification, she would rather have died than let him know. She soon tired of her attachments, she told me. She did not like T.D. He was not the complacent husband; he was spirited enough, but he believed everything she told him. One day he came home unexpectedly when we were together on the bare palliass in her room. It was a critical moment when his knocks were heard, and in the hurry and excitement some moisture was left on the bed. The knocks became louder, but she was calmer than I, and bade me run down to the closet. I could hear her cheerful and chaffing voice greeting him. When I walked in back to my own room she called out: 'Here's T. home!' I learned afterward that he had been surly and suspicious, and had seen the moisture on the bed, and asked about it, whereupon she had turned the tables upon him completely; he ought to be ashamed of himself; she knew what he meant by his insinuations; if he must know how that moisture come on the bed, why she put the soap there in a hurry to catch a flea. He believed her and brought her a present next day in atonement for his suspicions.

"During her monthly periods, when I could not touch her, she would come in and play with me until emissions occurred, and my feelings had become so perverted that I even preferred this to coitus. The orgasm would occur twice in her to once in me, and though her eyes were rather hard and her mouth too, she always looked well and cheerful, while I was gloomy and depressed. In her side, however, was a hard lump, which pained her at times, and which, doubtless, was waiting its time....

"One day I felt so low in health that I proposed to T.D. that we should take a boat and sail out in the bay for a day or two. The sea, the change, the open air revived me, and I even made sketches of the black sailor as he steered the boat. One day when I was left alone in charge of the boat, as I felt the time hanging on my hands, for the sea, the blue sky, the lovely day gave me no real pleasure, I remember abusing myself, the old habit reasserting itself as soon as I was alone and idle. When

T.D. came back he brought Mrs. D. with him, laughing and jolly as usual. She was surprised when lying next to me under the deck on our return I did not respond to her advances. It would have pleased her, with her husband only a few feet away. After that I spent a night with her, but she was getting tired of me. I did not care for her, but it hurt my vanity and I made a few attempts to be impertinent. She looked at me coldly and threatened to complain to T....

"I want to relate an impression I received one night about this time when with several friends we called at a brothel. I forget my companion, but I remember two faces. It was winter, and great depression prevailed in Adelaide. We had been talking to the mistress as we drank some beer and were pretending to be jolly fellows, although we were wet, cold, and had not enjoyed ourselves (at least, I had not), and she was speaking harshly and jeeringly about two girls she had now who had not earned a penny for the past week. Just then we heard footsteps and she said in a lower tone: 'Here they are,' They came in, unattended, having ascertained which the brothel-keeper snorted and turned her back to them. The faces of the girls, who were quite young, looked so miserable that even I pitied them. The look on the face of one of those girls as she stood by the hearth drawing off her gloves lives in my memory. Too deep for tears was its sorrow, shame, and hopelessness....

"I had given up drink and was living in the bush. To anyone with normal nerves it would have been a happy time of quiet, rustic peace, beauty, and relief from city life. With me it was restless vanity amounting to madness. In every relation, action, or possible event in which I figured or might figure in the future, I always instantaneously called up an imaginary audience. And then this imaginary audience admired everything I did or might do, and put the most heroic, gallant, and romantic construction on my acts, appearance, lineage, and breeding. Suppose I saw a pretty girl on a bush road. Instead of thinking 'There is a pretty girl; I should like to know her or kiss her,' as I suppose a healthy, normal young man would think, I thought after this fashion: 'There is a pretty girl; now, as I pass her she will think I am a handsome and aristocratic-looking stranger, and, as I carry a sketch-book, an artist--"A landscape painter! How romantic!" she will say, and then she will fall in love with me,'

etc. This preoccupation with what other people might think or would think so engrossed all my time that I had no means of enjoying the presence, thought, or favor of the divine creatures I met, and I must have appeared 'cracked' to them with my reticence, pride, and silly airs.

"I met girls as foolish as myself sometimes. Once at a _table d'hôte_ I met a young girl who went for a walk with me and let me know her carnally although she was little more than a schoolgirl. She was going down to town soon, she said, and would meet me at a certain hotel (belonging to relations of hers) in Adelaide on a certain date, some time ahead; if I took a room there she would come into it during the night. In the meanwhile I had given way to drink again and abused myself at intervals. I came down to town, drunk, in the coach, and kept my appointment with the young girl at the hotel, expecting a night of pleasure; but she merely stared at me coldly as if she had never seen me before. I abused myself twice in my solitary room....

"I met a middle-aged schoolteacher (who had once been an officer in the army) down for his holidays. As he spoke well, and was a 'gentleman,' I cultivated him. One night he asked me to meet a girl he had an appointment with and tell her he was not well enough to meet her. He foolishly told me the purpose of their intended meeting. I went to the trysting-place, at the back of the hotel, and met the girl. On delivering my message she smiled, made some joke about her friend, and looked at me as much as to say: 'You will do as well.' I had been drinking, and in the most brutal manner I took her into a closet. By some strange chance or state of nerves she gave me exquisite pleasure, but the orgasm came with me before it did with her, and in spite of her disappointment and protests I stood up and pulled her out of the place for fear some one should find us there. Still protesting she followed me, but her foot slipped on the paved court, and she fell down on her face. When she rose I saw that her front teeth were broken. I looked at her without pity, with impatience, and abruptly leaving her I went into the hotel to 'the colonel.' I commenced to tell him lies, when he asked me with a weak laugh what had been keeping me. I smiled with low cunning and drunken vanity, evading the question. Then he accused me directly. I only laughed; but, drunk as I was, I remember the look of the ageing bachelor as he saw he had been betrayed by a younger man. He had

known her for years....

"I was now living in the home of a woman who was separated from her husband and kept lodgers. She had a daughter, with whom I walked out, a pretty girl who drank like a fish, as her mother also did. There were other lodgers coming and going. I would lie down all day and keep myself saturated with beer. I commenced to get fat and bloated, with the ways of a brothel bully. A broken-down, drunken old woman who visited the house and had been a beautiful lady in her youth told me I should end my days on the gallows trap. The same woman when drunk would lift up her dress, sardonically, exposing herself. Other old women would congregate in the neglected and dirty bedrooms and tell fortunes with the cards. One little woman, an onanist, was like a character out of Dickens, exaggerated, affected, unnatural, with remains of gentility and society manners. Amidst all this drunkenness and abandonment May, the landlady's daughter, preserved her virginity. Young lodgers would take liberties with her, but at a certain stage would receive a stinger on the face. The girl liked me and would kiss me, but nothing else. And then--out of this home of drunkenness and shame--May fell in love with some pretty boy she met by chance, whom she never asked to her home. She began to neglect me, even to neglect drink, and to dream, preoccupied. I felt a restless jealousy, but she would look at me, without resentment, without recognition, without seeing me, look me straight in the eyes as I was talking to her, and dream and dream. This same pretty boy seduced her, I believe. When next I met her she was 'on the town,' her one dream of spring over....

"About this time I had one of those salutary turns that have marked epochs in my life, and as a result I left that house and resolutely abstained from drink.... I was now in a small up-country town. I commenced to play croquet and to ride out. Sometimes I was invited to dinner by a young man at the bank, whose house was kept by his sister. She had a small figure, a pretty but rather narrow face, and well-bred manners; but there was a look in her asymmetrical eyes, in the shape of her thin hands, even in the stoop of her shoulders, that seemed passionate. One day--when her brother, a fine, sweet-blooded manly young athlete, was absent--I commenced to pull her about. She gave me one passionate kiss, but said: 'No! Do you know what keeps me straight? It is the thought of my brother.' I refrained

from molesting her further. I met other girls, some pretty and arrogant, others plain and hungry-eyed; it was a country town where there were four or five females to every male. But I could not speak frankly and candidly to a young woman as the young banker did....

"I remember that one night, when I was living at the Port, I slept all night with a prostitute who had taken a fancy to me and who used to cry on my shoulder, much to my impatience and annoyance. In the same bed with us, lying beside me, was a girl aged about 12. On my expressing surprise I was told she was used to it and noticed nothing. But in the morning I turned my head and looked at her, and even in the dim light of that dirty bedroom I could see that her eyes had noticed and understood. She pressed herself against me and smiled; it was not the smile of an infant. I could record many instances I have observed of the precocity of children.

"At one time I made the acquaintance of three young men, two in the customs, the other in a surveyor's office. At the first glance you would have said they were ordinary nice young clerks, but on becoming better acquainted you would notice certain peculiarities, a looseness of mouth, a restless, nervous inquietude of manner, an indescribable gleam of the eye. They were very fond of performing and singing at amateur minstrel shows and developed a certain comic vein they thought original, though it reminded me of professional corner-men. However, I enjoyed their singing and drinking habits and went to their lodgings several nights to play cards, drink beer, and tell funny stories. One night they asked me to stay all night and on going to a room with two beds I was told to have one. Presently one of the young men came in and commenced to undress. But before going to his bed he made a remark which, though I had been drinking, opened my eyes. I told him to shut up and go to bed, speaking firmly and rather coldly, and he went reluctantly to his own bed. But another night when they had shifted their lodgings and were all sleeping in the same room I was drunk and went to bed with the same fair-haired young man. On waking up in the night I found my bedmate tampering with me. The old force came over me and I abused him, but refused to commit the crime he wanted me to. His penis was small and pointed. I rose early in the morning, sobered, suffering, and covered with shame, and went hastily

away, refusing to stay for breakfast. I thought I caught an amazed and evil smile on the faces of the other two. Meeting the three the same evening in the street, I passed them blushing, and my bedmate of the previous night blushed also....

"I now took cheap lodgings in North Adelaide. Here I had slight recurrences of the strangeness and fear of going mad which I had experienced once before. I led such a solitary life and fell into such a queer state that I turned to religion and attended church regularly. It was approaching the time for those young men and women who wished to be confirmed to prepare themselves, and a struggle now ensued between my pride and my wish to gain rest and peace of mind in Jesus. I was self-conscious to an incredible degree, and dreaded exposure or making an exhibition of myself, but still went to church, hoping the grace of God would descend on me. I had no other resources. I had no pleasure in life, and was so shattered and in such misery of dread that I welcomed the only refuge that seemed open to me. At last, one Sunday, I had what I thought was a call; I shed a few tears, and although tingling all down my spine I went up in the cathedral and joined those who were going to be confirmed. I attended special meetings and shocked the good bishop very much by telling him I had never been baptized. I had to be baptized first and went one day to the cathedral and he baptized me. When the critical awful moment came the bishop, whose faith even then surprised me somehow, held my hand in his cold palm, and gave it a pressure, eyeing me, expectantly, inquisitively, to see any change for the better. But, it so happened, that morning I was in a horrible temper and black mood, hard and dry-eyed, and no change came. Still, I tried to believe there was a change.

"I was confirmed with others, had a prayer-book given me with prayers for nearly every hour in the day, and was always kneeling and praying. I procured a long, white surplice, and assisted at suburban services, even conducting small ones myself, reading the sermons out of books. But my mood of rage increased, and one Sunday I had to walk a long way in a new pair of boots. I shall never forget that hot Sunday afternoon. My feet commenced to ache and a murderous humor seized me. I swore and blasphemed one moment and prayed to God to forgive me the next. When I reached the chapel where I had to assist the chaplain I was exhausted with rage, pain, fear, and religious mania. I thought it probable

I had offended the Holy Ghost. When, next Sunday, I went to try my hand at Sunday-school teaching I wore a pair of boots so old that the little boys laughed. I was always talking of my conversion and the spirit of our Saviour. I do not know what the clergymen I met thought of me. I thought I should like to be a minister myself, and questioned a Church of England parson as to the amount of study necessary. He received my question rather coldly, I thought, which discouraged me. As my dread gradually diminished, though I still felt strange, I made excuses for not conducting services, although I continued to read my Bible and prayer-book, and really believed I had been 'born again.'

"Surely now, I thought, that I had Christ's aid, I shall be able to break off my habit of self-abuse that had been the curse of my youth. What was my horror and dismay to find that, when the mood came on me next, I went down the same as ever. And after all my suffering and dread and fear of fits! What could I do? Was I mad, or what? I was really frightened at my helplessness in the matter and decided on a course of conduct that ultimately brought me past this danger to better health and comparative happiness. I said to myself that there is always a certain amount of preliminary thought and dalliance before I do this deed; doubtless this it is that renders me incapable of resisting. I decided, therefore, never to let my thoughts _commence_ to dwell on lustful things, but to think of something else on the _first_ intimation of their appearance in my mind. I rigorously followed this rule; and it proved successful, and I recommend it to others in the same predicament as myself. After suffering weeks and months of dread and illness once more, falling away in flesh and turning yellow, I gradually mended a little. I had a better color and tone, and was something like other young men, barring a strange alternate exaltation and depression. Even this gradually became less noticeable, and my moods more even and reliable."

FOOTNOTES:

[219] My Christian faith is of a somewhat nonemotional, intellectual type, with a considerable element of agnostic reserve.

[220] On having connection with my wife I frequently exhibit sufficient sexual power to produce orgasm in her; but on occasion, especially during

the first year or so of married life, I have been unable to do this, owing to the too rapid action of the reflexes in myself, and have even, now and again, had emissions ante portam.

STUDIES IN THE PSYCHOLOGY OF SEX, VOLUME V

Erotic Symbolism
The Mechanism of Detumescence
The Psychic State in Pregnancy

by

HAVELOCK ELLIS

1927

PREFACE.

In this volume the terminal phenomena of the sexual process are discussed, before an attempt is finally made, in the concluding volume, to consider the bearings of the psychology of sex on that part of morals which may be called "social hygiene."

Under "Erotic Symbolism" I include practically all the aberrations of the sexual instinct, although some of these have seemed of sufficient importance for separate discussion in previous volumes. It is highly probable that many readers will consider that the name scarcely suffices to cover manifestations so numerous and so varied. The term "sexual equivalents" will seem preferable to some. While, however, it may be fully admitted that these perversions are "sexual equivalents"--or at all events equivalents of the normal sexual impulse--that term is merely a descriptive label which tells us nothing of the phenomena. "Sexual Symbolism" gives us the key to the process, the key that makes all these perversions intelligible. In all of them--very clearly in some, as in shoe-fetichism; more obscurely in others, as in exhibitionism--it has come about by causes congenital, acquired, or both, that some object or class of objects, some act or group of acts, has acquired a dynamic power over

the psycho-physical mechanism of the sexual process, deflecting it from its normal adjustment to the whole of a beloved person of the opposite sex. There has been a transmutation of values, and certain objects, certain acts, have acquired an emotional value which for the normal person they do not possess. Such objects and acts are properly, it seems to me, termed symbols, and that term embodies the only justification that in most cases these manifestations can legitimately claim.

"The Mechanism of Detumescence" brings us at last to the final climax for which the earlier and more prolonged stage of tumescence, which has occupied us so often in these Studies, is the elaborate preliminary. "The art of love," a clever woman novelist has written, "is the art of preparation." That "preparation" is, on the physiological side, the production of tumescence, and all courtship is concerned in building up tumescence. But the final conjugation of two individuals in an explosion of detumescence, thus slowly brought about, though it is largely an involuntary act, is still not without its psychological implications and consequences; and it is therefore a matter for regret that so little is yet known about it. The one physiological act in which two individuals are lifted out of all ends that center in self and become the instrument of those higher forces which fashion the species, can never be an act to be slurred over as trivial or unworthy of study.

In the brief study of "The Psychic State in Pregnancy" we at last touch the point at which the whole complex process of sex reaches its goal. A woman with a child in her womb is the everlasting miracle which all the romance of love, all the cunning devices of tumescence and detumescence, have been invented to make manifest. The psychic state of the woman who thus occupies the supreme position which life has to offer cannot fail to be of exceeding interest from many points of view, and not least because the maternal instinct is one of the elements even of love between the sexes. But the psychology of pregnancy is full of involved problems, and here again, as so often in the wide field we have traversed, we stand at the threshold of a door it is not yet given us to pass.

HAVELOCK ELLIS.

Carbis Water, Lelant, Cornwall.

CONTENTS.

EROTIC SYMBOLISM.

I.

The Definition of Erotic Symbolism. Symbolism of Act and Symbolism of Object. Erotic Fetichism. Wide Extension of the Symbols of Sex. The Immense Variety of Possible Erotic Fetiches. The Normal Foundations of Erotic Symbolism. Classification of the Phenomena. The Tendency to Idealize the Defects of a Beloved Person. Stendhal's "Crystallization".

EROTIC SYMBOLISM.

I.

The Definition of Erotic Symbolism--Symbolism of Act and Symbolism of Object--Erotic Fetichism--Wide extension of the symbols of Sex--The Immense Variety of Possible Erotic Fetiches--The Normal Foundations of Erotic Symbolism--Classification of the Phenomena--The Tendency to Idealize the Defects of a Beloved Person--Stendhal's "Crystallization."

By "erotic symbolism" I mean that tendency whereby the lover's attention is diverted from the central focus of sexual attraction to some object or process which is on the periphery of that focus, or is even outside of it altogether, though recalling it by association of contiguity or of similarity. It thus happens that tumescence, or even in extreme cases detumescence, may be provoked by the contemplation of acts or objects which are away from the end of sexual conjugation.[1]

In considering the phenomena of sexual selection in a previous volume,[2] it was found that there are four or five main factors in the constitution of beauty in so far as beauty determines sexual selection. Erotic symbolism is founded on the factor of individual taste in beauty; it arises as a specialized development of that factor, but it is, nevertheless, incorrect to merge it in sexual selection. The attractive characteristics of a beloved woman or man, from the point of view of sexual selection, are a complex but harmonious whole leading up to a desire for the complete possession of the person who displays them. There

is no tendency to isolate and dissociate any single character from the individual and to concentrate attention upon that character at the expense of the attention bestowed upon the individual generally. As soon as such a tendency begins to show itself, even though only in a slight or temporary form, we may say that there is erotic symbolism.

Erotic symbolism is, however, by no means confined to the individualizing tendency to concentrate amorous attention upon some single characteristic of the adult woman or man who is normally the object of sexual love. The adult human being may not be concerned at all, the attractive object or act may not even be human, not even animal, and we may still be concerned with a symbol which has parasitically rooted itself on the fruitful site of sexual emotion and absorbed to itself the energy which normally goes into the channels of healthy human love having for its final end the procreation of the species. Thus understood in its widest sense, it may be said that every sexual perversion, even homosexuality, is a form of erotic symbolism, for we shall find that in every case some object or act that for the normal human being has little or no erotic value, has assumed such value in a supreme degree; that is to say, it has become a symbol of the normal object of love. Certain perversions are, however, of such great importance on account of their wide relationships, that they cannot be adequately discussed merely as forms of erotic symbolism. This is notably the case as regards homosexuality, auto-erotism, and algolagnia, all of which phenomena have therefore been separately discussed in previous studies. We are now mainly concerned with manifestations which are more narrowly and exclusively symbolical.

A portion of the field of erotic symbolism is covered by what Binet (followed by Lombroso, Krafft-Ebing, and others) has termed "erotic fetichism," or the tendency whereby sexual attraction is unduly exerted by some special part or peculiarity of the body, or by some inanimate object which has become associated with it. Such erotic symbolism of object cannot, however, be dissociated from the even more important erotic symbolism of process, and the two are so closely bound together that we cannot attain a truly scientific view of them until we regard them broadly as related parts of a common psychic tendency. If, as Groos asserts,[3] a symbol has two chief meanings, one in which it indicates a physical process which stands for a psychic process, and another in which it indicates a part which represents the whole, erotic symbolism of act corresponds to the first of these chief meanings, and erotic symbolism of object to the other.

Although it is not impossible to find some germs of erotic symbolism in animals, in its more pronounced manifestations it is only found in the human species. It could not be otherwise, for such symbolism involves not only the play of fancy and imagination, the idealizing aptitude, but also a certain amount of power of concentrating the attention on a point outside the natural path of instinct and the ability to form new mental constructions around that point. There are, indeed, as we shall see, elementary forms of erotic symbolism which are not uncommonly associated with feeble-mindedness, but even these are still peculiarly human, and in its less crude manifestations erotic symbolism easily lends itself to every degree of human refinement and intelligence.

"It depends primarily upon an increase of the psychological process of representation," Colin Scott remarks of sexual symbolism generally, "involving greater powers of comparison and analysis as compared with the lower animals. The outer impressions come to be clearly distinguished as such, but at the same time are often treated as symbols of inner experiences, and a meaning read into them which they would not otherwise possess. Symbolism or fetichism is, indeed, just the capacity to see meaning, to emphasize something for the sake of other things which do not appear. In brain terms it indicates an activity of the higher centers, a sort of side-tracking or long-circuiting of the primitive energy; ... Rosetti's poem, 'The Woodspurge,' gives a concrete example of the formation of such a symbol. Here the otherwise insignificant presentation of the three-cupped woodspurge, representing originally a mere side-current of the stream of consciousness, becomes the intellectual symbol or fetich of the whole psychosis forever after. It seems, indeed, as if the stronger the emotion the more likely will become the formation of an overlying symbolism, which serves to focus and stand in the place of something greater than itself; nowhere at least is symbolism a more characteristic feature than as an expression of the sexual instinct. The passion of sex, with its immense hereditary background, in early man became centered often upon the most trivial and unimportant features.... This symbolism, now become fetichistic, or symbolic in a bad sense, is at least an exercise of the increasing representative power of man, upon which so much of his advancement has depended, while it also served to express and help to purify his most perennial emotion." (Colin Scott, "Sex and Art," *American Journal of Psychology*, vol. vii, No. 2, p. 189.)

In the study of "Love and Pain" in a previous volume, the analysis of the large and complex mass of sexual phenomena which are associated with pain, gradually resolved them to a considerable extent into a special case of erotic symbolism; pain or restraint, whether inflicted on or by the loved person, becomes, by a psychic process that is usually unconscious, the symbol of the sexual mechanism, and hence arouses the same emotions as that mechanism normally arouses. We may now attempt to deal more broadly and comprehensively with the normal and abnormal aspects of erotic symbolism in some of their most typical and least mixed forms.

"When our human imagination seeks to animate artificial things," Huysmans writes in *_La-bas_*, "it is compelled to reproduce the movements of animals in the act of propagation. Look at machines, at the play of pistons in the cylinders; they are Romeos of steel in Juliets of cast-iron." And not only in the work of man's hands but throughout Nature we find sexual symbols which are the less deniable since, for the most part, they make not the slightest appeal to even the most morbid human imagination. Language is full of metaphorical symbols of sex which constantly tend to lose their poetic symbolism and to become commonplace. Semen is but seed, and for the Latins especially the whole process of human sex, as well as the male and female organs, constantly presented itself in symbols derived from agricultural and horticultural life. The testicles were beans (*_fabae_*) and fruit or apples (*_poma_* and *_mala_*); the penis was a tree (*_arbor_*), or a stalk (*_thyrsus_*), or a root (*_radix_*), or a sickle (*_falx_*), or a ploughshare (*_vomer_*). The semen, again, was dew (*_ros_*). The labia majora or minora were wings (*_alae_*); the vulva and vagina were a field (*_ager_* and *_campus_*), or a ploughed furrow (*_sulcus_*), or a vineyard (*_vinea_*), or a fountain (*_fons_*), while the pudendal hair was herbage (*_plantaria_*).[4] In other languages it is not difficult to trace similar and even identical imagery applied to sexual organs and sexual acts. Thus it is noteworthy that Shakespeare more than once applies the term "ploughed" to a woman who has had sexual intercourse. The Talmud calls the labia minora the doors, the labia majora hinges, and the clitoris the key. The Greeks appear not only to have found in the myrtle-berry, the fruit of a plant sacred to Venus, the image of the clitoris, but also in the rose an image of the feminine labia; in the poetic literature of many countries, indeed, this imagery of the rose may be traced in a more or less veiled manner.[5]

The widespread symbolism of sex arose in the theories and conceptions of primitive peoples concerning the function of generation and its nearest

analogies in Nature; it was continued for the sake of the vigorous and expressive terminology which it furnished both for daily life and for literature; its final survivals were cultivated because they furnished a delicately aesthetic method of approaching matters which a growing refinement of sentiment made it difficult for lovers and poets to approach in a more crude and direct manner. Its existence is of interest to us now because it shows the objective validity of the basis on which erotic symbolism, as we have here to understand it, develops. But from first to last it is a distinct phenomenon, having a more or less reasoned and intellectual basis, and it scarcely serves in any degree to feed the sexual impulse. Erotic symbolism is not intellectual but emotional in its origin; it starts into being, obscurely, with but a dim consciousness or for the most part none at all, either suddenly from the shock of some usually youthful experience, or more gradually through an instinctive brooding on those things which are most intimately associated with a sexually desirable person.

The kind of soil on which the germs of erotic symbolism may develop is well seen in cases of sexual hyperaesthesia. In such cases all the emotionally sexual analogies and resemblances, which in erotic symbolism are fixed and organized, may be traced in vague and passing forms, a single hyperaesthetic individual perhaps presenting a great variety of germinal symbolisms.

Thus it has been recorded of an Italian nun (whose sister became a prostitute) that from the age of 8 she had desire for coitus, from the age of 10 masturbated, and later had homosexual feelings, that the same feelings and practices continued after she had taken the veil, though from time to time they assumed religious equivalents. The mere contact, indeed, of a priest's hand, the news of the presentation of an ecclesiastic she had known to a bishopric, the sight of an ape, the contemplation of the crucified Christ, the figure of a toy, the picture of a demon, the act of defecation in the children entrusted to her care (whom, on this account, and against the regulations, she would accompany to the closets), especially the sight and the mere recollection of flies in sexual connection--all these things sufficed to produce in her a powerful orgasm. (_Archivio di Psichiatria_, 1902, fasc. II-III, p. 338.)

A boy of 15 (given to masturbation), studied by Macdonald in America, was similarly hyperaesthetic to the symbols of sexual

emotion. "I like amusing myself with my comrades," he told Macdonald, "rolling ourselves into a ball, which gives one a funny kind of warmth. I have a special pleasure in talking about some things. It is the same when the governess kisses me on saying good night or when I lean against her breast. I have that sensation, too, when I see some of the pictures in the comic papers, but only in those representing a woman, as when a young man skating trips up a girl so that her clothes are raised a little. When I read how a man saved a young girl from drowning, so that they swam together, I had the same sensation. Looking at the statues of women in the museum produces the same effect, or when I see naked babies, or when a mother suckles a child. I have often had that sensation when reading novels I ought not to read, or when looking at a new-born calf, or seeing dogs and cows and horses mounting on each other. When I see a girl flirting with a boy, or leaning on his shoulder or with his arm round her waist, I have an erection. It is the same when I see women and little girls in bathing costume, or when boys talk of what their fathers and mothers do together. In the Natural History Museum I often see things which give me that sensation. One day when I read how a man killed a young girl and carried her into a wood and undressed her I had a feeling of enjoyment. When I read of men who were bastards the idea of a woman having a child in that way gives me this sensation. Some dances, and seeing young girls astride a horse, excited me, too, and so in a circus when a woman was shot out of a cannon and her skirts flew in the air. It has no effect on me when I see men naked. Sometimes I enjoy seeing women's underclothes in a shop, or when I see a lady or a girl buying them, especially if they are drawers. When I saw a lady in a dress which buttoned from top to bottom it had more effect on me than seeing underclothes. Seeing dogs coupling gives me more pleasure than looking at pretty women, but less than looking at pretty little girls." In order of increasing intensity he placed the phenomena that affected him thus: The coupling of flies, then of horses, then the sight of women's undergarments, then a boy and a girl flirting, then cows mounting on each other, the statues of women with naked breasts, then contact with the governess's body and breasts, finally coitus. (Arthur Macdonald, Le Criminel-Type, pp. 126 et seq.)

It is worthy of remark that the instinct of nutrition, when restrained, may exhibit something of an analogous symbolism,

though in a minor degree, to that of sex. The ways in which a hyperaesthetic hunger may seek its symbols are illustrated in the case of a young woman called Nadia, who during several years was carefully studied by Janet. It is a case of obsession ("maladie du scrupule"), simulating hysterical anorexia, in which the patient, for fear of getting fat, reduced her nourishment to the smallest possible amount. "Nadia is generally hungry, even very hungry. One can tell this by her actions; from time to time she forgets herself to such an extent as to devour greedily anything she can put her hands on. At other times, when she cannot resist the desire to eat, she secretly takes a biscuit. She feels horrible remorse for the action, but, all the same, she does it again. Her confidences are very curious. She recognizes that a great effort is needed to avoid eating, and considers she is a heroine to resist so long. 'Sometimes I spent whole hours in thinking about food, I was so hungry; I swallowed my saliva, I bit my handkerchief, I rolled on the floor, I wanted to eat so badly. I would look in books for descriptions of meals and feasts, and tried to deceive my hunger by imagining that I was sharing all these good things,' " (P. Janet, "La Maladie du Scrupule," *_Revue Philosophique_*, May, 1901, p. 502.) The deviations of the instinct of nutrition are, however, confined within narrow limits, and, in the nature of things, hunger, unlike sexual desire, cannot easily accept a fetich.

"There is almost no feature, article of dress, attitude, act," Stanley Hall declares, "or even animal or perhaps object in nature, that may not have to some morbid soul specialized erogenic and erethic power." [6] Even a mere shadow may become a fetich. Goron tells of a merchant in Paris--a man with a reputation for ability, happily married and the father of a family, altogether irreproachable in his private life--who was returning home one evening after a game of billiards with a friend, when, on chancing to raise his eyes, he saw against a lighted window the shadow of a woman changing her chemise. He fell in love with that shadow and returned to the spot every evening for many months to gaze at the window. Yet--and herein lies the fetichism--he made no attempt to see the woman or to find out who she was; the shadow sufficed; he had no need of the realty. [7] It is even possible to have a negative fetich, the absence of some character being alone demanded, and the case has been recorded in Chicago of an American gentleman of average intelligence, education, and good habits who, having as a boy cherished a pure affection for a girl whose leg had been amputated, throughout life was relatively impotent with

normal women, but experienced passion and affection for women who had lost a leg; he was found by his wife to be in extensive correspondence with one-legged women all over the country, expending no little money on the purchase of artificial legs for his various proteges.[8]

It is important to remember, however, that while erotic symbolism becomes fantastic and abnormal in its extreme manifestations, it is in its essence absolutely normal. It is only in the very grossest forms of sexual desire that it is altogether absent. Stendhal described the mental side of the process of tumescence as a crystallization, a process whereby certain features of the beloved person present points around which the emotions held in solution in the lover's mind may concentrate and deposit themselves in dazzling brilliance. This process inevitably tends to take place around all those features and objects associated with the beloved person which have most deeply impressed the lover's mind, and the more sensitive and imaginative and emotional he is the more certainly will such features and objects crystallize into erotic symbols. "Devotion and love," wrote Mary Wollstonecraft, "may be allowed to hallow the garments as well as the person, for the lover must want fancy who has not a sort of sacred respect for the glove or slipper of his mistress. He would not confound them with vulgar things of the same kind." And nearly two centuries earlier Burton, who had gathered together so much of the ancient lore of love, clearly asserted the entirely normal character of erotic symbolism. "Not one of a thousand falls in love," he declares, "but there is some peculiar part or other which pleaseth most, and inflames him above the rest.... If he gets any remnant of hers, a busk-point, a feather of her fan, a shoe-tie, a lace, a ring, a bracelet of hair, he wears it for a favor on his arm, in his hat, finger, or next his heart; as Laodamia did by Protesilaus, when he went to war, sit at home with his picture before her: a garter or a bracelet of hers is more precious than any Saint's Relique, he lays it up in his casket (O blessed Relique) and every day will kiss it: if in her presence his eye is never off her, and drink he will where she drank, if it be possible, in that very place," etc.[9]

Burton's accuracy in describing the ways of lovers in his century is shown by a passage in Hamilton's *Memoires de Gramont*. Miss Price, one of the beauties of Charles II's court, and Dongan were tenderly attached to each other; when the latter died he left behind a casket full of all possible sorts of love-tokens pertaining to his mistress, including, among other things, "all kinds of hair." And as regards France, Burton's contemporary, Howell, wrote in 1627 in his *Familiar Letters* concerning the

repulse of the English at Rhe: "A captain told me that when they were rifling the dead bodies of the French gentlemen after the first invasion they found that many of them had their mistresses' favors tied about their genitories."

Schurig (*_Spermatologia_*, p. 357) at the beginning of the eighteenth century knew a Belgian lady who, when her dearly loved husband died, secretly cut off his penis and treasured it as a sacred relic in a silver casket. She eventually powdered it, he adds, and found it an efficacious medicine for herself and others. An earlier example, of a lady at the French court who embalmed and perfumed the genital organs of her dead husband, always preserving them in a gold casket, is mentioned by Brantome. Mantegazza knew a man who kept for many years on his desk the skull of his dead mistress, making it his dearest companion. "Some," he remarks, "have slept for months and years with a book, a garment, a trifle. I once had a friend who would spend long hours of joy and emotion kissing a thread of silk which she had held between her fingers, now the only relic of love." (Mantegazza, *_Fisiologia dell' Amore_*, cap. X.) In the same way I knew a lady who in old age still treasured in her desk, as the one relic of the only man she had ever been attracted to, a fragment of paper he had casually twisted up in a conversation with her half a century before.

The tendency to treasure the relics of a beloved person, more especially the garments, is the simplest and commonest foundation of erotic symbolism. It is without doubt absolutely normal. It is inevitable that those objects which have been in close contact with the beloved person's body, and are intimately associated with that person in the lover's mind, should possess a little of the same virtue, the same emotional potency. It is a phenomenon closely analogous to that by which the relics of saints are held to possess a singular virtue. But it becomes somewhat less normal when the garment is regarded as essential even in the presence of the beloved person.[10]

While an extremely large number of objects and acts may be found to possess occasionally the value of erotic symbols, such symbols most frequently fall into certain well-defined groups. A vast number of isolated objects or acts may be exceptionally the focus of erotic contemplation, but the objects and acts which frequently become thus symbolic are comparatively few.

It seems to me that the phenomena of erotic symbolism may be most conveniently grouped in three great classes, on the basis of the objects or acts which arouse them.

I. PARTS OF THE BODY.--_A. Normal:_ Hand, foot, breasts, nates, hair, secretions and excretions, etc.

B. Abnormal: Lameness, squinting, pitting of smallpox, etc. Paidophilia or the love of children, presbyophilia or the love of the aged, and necrophilia or the attraction for corpses, may be included under this head, as well as the excitement caused by various animals.

II. INANIMATE OBJECTS.[11]--_A. Garments:_ Gloves, shoes and stockings and garters, caps, aprons, handkerchiefs, underlinen.

B. Impersonal Objects: Here may be included all the various objects that may accidentally acquire the power of exciting sexual feeling in auto-erotism. Pygmalionism may also be included.

III. ACTS AND ATTITUDES.--_A. Active:_ Whipping, cruelty, exhibitionism.

B. Passive: Being whipped, experiencing cruelty. Personal odors and the sound of the voice may be included under this head. _C. Mixoscopic:_ The vision of climbing, swinging, etc. The acts of urination and defecation. The coitus of animals.

Although the three main groups into which the phenomena of erotic symbolism are here divided may seem fairly distinct, they are yet very closely allied, and indeed overlap, so that it is possible, as we shall see, for a single complex symbol to fall into all three groups.

A very complete kind of erotic symbolism is furnished by Pygmalionism or the love of statues.[12] It is exactly analogous to the child's love of a doll, which is also a form of sexual (though not erotic) symbolism. In a somewhat less abnormal form, erotic symbolism probably shows itself in its simplest shape in the tendency to idealize unbeautiful peculiarities in a beloved person, so that such peculiarities are ever afterward almost or quite essential in order to arouse sexual attraction. In this way men have become attracted to limping women. Even the most normal man may idealize a trifling defect in a beloved woman. The attention is inevitably

concentrated on any such slight deviation from regular beauty, and the natural result of such concentration is that a complexus of associated thoughts and emotions becomes attached to something that in itself is unbeautiful. A defect becomes an admired focus of attention, the embodied symbol of the lover's emotion.

Thus a mole is not in itself beautiful, but by the tendency to erotic symbolism it becomes so. Persian poets especially have lavished the richest imagery on moles (Anis El-Ochchaq in Bibliothèque des Hautes Etudes, fasc. 25, 1875); the Arabs, as Lane remarks (Arabian Society in the Middle Ages, p. 214), are equally extravagant in their admiration of a mole.

Stendhal long since well described the process by which a defect becomes a sexual symbol. "Even little defects in a woman's face," he remarked, "such as a smallpox pit, may arouse the tenderness of a man who loves her, and throw him into deep reverie when he sees them in another woman. It is because he has experienced a thousand feelings in the presence of that smallpox mark, that these feelings have been for the most part delicious, all of the highest interest, and that, whatever they may have been, they are renewed with incredible vivacity on the sight of this sign, even when perceived on the face of another woman. If in such a case we come to prefer and love ugliness, it is only because in such a case ugliness is beauty. A man loved a woman who was very thin and marked by smallpox; he lost her by death. Three years later, in Rome, he became acquainted with two women, one very beautiful, the other thin and marked by smallpox, on that account, if you will, rather ugly. I saw him in love with this plain one at the end of a week, which he had employed in effacing her plainness by his memories." (De l'Amour, Chapter XVII.)

In the tendency to idealize the unbeautiful features of a beloved person erotic symbolism shows itself in a simple and normal form. In a less simple and more morbid form it appears in persons in whom the normal paths of sexual gratification are for some reasons inhibited, and who are thus led to find the symbols of natural love in unnatural perversions. It is for this reason that so many erotic symbolisms take root in childhood and puberty, before the sexual instincts have reached full development. It is for the same reason also, that, at the other end of life, when the sexual energies are failing, erotic symbols sometimes tend to be substituted for the normal pleasures of sex. It is for this reason, again, that both men

and women whose normal energies are inhibited sometimes find the symbols of sexual gratification in the caresses of children.

The case of a schoolmistress recorded by Penta instructively shows how an erotic symbolism of this last kind may develop by no means as a refinement of vice, but as the one form in which sexual gratification becomes possible when normal gratification has been pathologically inhibited. F.R., aged 48, schoolmistress; she was some years ago in an asylum with religious mania, but came out well in a few months. At the age of 12 she had first experienced sexual excitement in a railway train from the jolting of the carriage. Soon after she fell in love with a youth who represented her ideal and who returned her affection. When, however, she gave herself to him, great was her disillusion and surprise to find that the sexual act which she had looked forward to could not be accomplished, for at the first contact there was great pain and spasmodic resistance of the vagina. There was a condition of vaginismus. After repeated attempts on subsequent occasions her lover desisted. Her desire for intercourse increased, however, rather than diminished, and at last she was able to tolerate coitus, but the pain was so great that she acquired a horror of the sexual embrace and no longer sought it. Having much will power, she restrained all erotic impulses during many years. It was not until the period of the menopause that the long repressed desires broke out, and at last found a symbolical outlet that was no longer normal, but was felt to supply a complete gratification. She sought the close physical contact of the young children in her care. She would lie on her bed naked, with two or three naked children, make them suck her breasts and press them to every part of her body. Her conduct was discovered by means of other children who peeped through the keyhole, and she was placed under Penta for treatment. In this case the loss of moral and mental inhibition, due probably to troubles of the climacteric, led to indulgence, under abnormal conditions, in those primitive contacts which are normally the beginning of love, and these, supported by the ideal image of the early lover, constituted a complete and adequate symbol of natural love in a morbidly perverted individual. (P. Penta, *_Archivio delle Psicopatie Sessuali_*, January, 1896.)

FOOTNOTES:

[1] The term "erotic symbolism" has already been employed by Eulenburg (*_Sexuale Neuropathie_*, 1895, p. 101). It must be borne in mind that this term, implying the specific emotion, is much narrower than the term "sexual symbolism," which may be used to designate a great variety of ritual and social practices which have played a part in the evolution of civilization.

[11] Chevalier (*_De l'Inversion_*, 1885; id., *_L'Inversion Sexuelle_*, 1892,

p. 52), followed by E. Laurent (*L'Amour Morbide*, 1891, Chapter X), separates this group from other fetichistic perversions, under the head of "azooephilie." I see no adequate ground for this step. The various forms of fetichism are too intimately associated to permit of any group of them being violently separated from the others.

[12] This has already been considered as a perversion founded on vision, in discussing *Sexual Selection in Man*. IV.

II.

Foot-fetichism and Shoe-fetichism--Wide Prevalence and Normal Basis--Restif de la Bretonne--The Foot a Normal Focus of Sexual Attraction Among Some Peoples--The Chinese, Greeks, Romans, Spaniards, etc.--The Congenital Predisposition in Erotic Symbolism--The Influence of Early Association and Emotional Shock--Shoe-fetichism in Relation to Masochism--The Two Phenomena Independent Though Allied--The Desire to be Trodden On--The Fascination of Physical Constraint--The Symbolism of Self-inflicted Pain--The Dynamic Element in Erotic Symbolism--The Symbolism of Garments.

Of all forms of erotic symbolism the most frequent is that which idealizes the foot and the shoe. The phenomena we here encounter are sometimes so complex and raise so many interesting questions that it is necessary to discuss them somewhat fully.

It would seem that even for the normal lover the foot is one of the most attractive parts of the body. Stanley Hall found that among the parts specified as most admired in the other sex by young men and women who answered a *questionnaire* the feet came fourth (after the eyes, hair, stature and size). [13] Casanova, an acute student and lover of women who was in no degree a foot fetichist, remarks that all men who share his interest in women are attracted by their feet; they offer the same interest, he considers, as the question of the particular edition offers to the book-lover. [14]

In a report of the results of a *questionnaire* concerning children's sense of self, to which over 500 replies were

received, Stanley Hall thus summarizes the main facts ascertained with reference to the feet: "A special period of noticing the feet comes somewhat later than that in which the hands are discovered to consciousness. Our records afford nearly twice as many cases for feet as for hands. The former are more remote from the primary psychic focus or position, and are also more often covered, so that the sight of them is a more marked and exceptional event. Some children become greatly excited whenever their feet are exposed. Some infants show signs of fear at the movement of their own knees and feet covered, and still more often fright is the first sensation which signalizes the child's discovery of its feet.... Many are described as playing with them as if fascinated by strange, newly-discovered toys. They pick them up and try to throw them away, or out of the cradle, or bring them to the mouth, where all things tend to go.... Children often handle their feet, pat and stroke them, offer them toys and the bottle, as if they, too, had an independent hunger to gratify, an ego of their own.... Children often develop [later] a special interest in the feet of others, and examine, feel them, etc., sometimes expressing surprise that the pinch of the mother's toe hurts her and not the child, or comparing their own and the feet of others point by point. Curious, too, are the intensifications of foot-consciousness throughout the early years of childhood, whenever children have the exceptional privilege of going barefoot, or have new shoes. The feet are often apostrophized, punished, beaten sometimes to the point of pain for breaking things, throwing the child down, etc. Several children have habits, which reach great intensity, and then vanish, of touching or tickling the feet, with gales of laughter, and a few are described as showing an almost morbid reluctance to wear anything upon the feet, or even to having them touched by others.... Several almost fall in love with the great toe or the little one, especially admiring some crease or dimple in it, dressing it in some rag of silk or bit of ribbon, or cut-off glove fingers, winding it with string, prolonging it by tying on bits of wood. Stroking the feet of others, especially if they are shapely, often becomes almost a passion with young children, and several adults confess a survival of the same impulse which it is an exquisite pleasure to gratify. The interest of some mothers in babies' toes, the expressions of which are ecstatic and almost incredible, is a factor of great importance." (G. Stanley Hall, "Some Aspects of the Early Sense of Self," American Journal of

Psychology_, April, 1898.) In childhood, Stanley Hall remarks elsewhere (_Adolescence_, vol. ii, p. 104), "a form of courtship may consist solely in touching feet under the desk." It would seem that even animals have a certain amount of sexual consciousness in the feet; I have noticed a male donkey, just before coitus, bite the feet of his partner.

At the same time it is scarcely usual for the normal lover, in most civilized countries to-day, to attach primary importance to the foot, such as he very frequently attaches to the eyes, though the feet play a very conspicuous part in the work of certain novelists.[15]

In a small but not inconsiderable minority of persons, however, the foot or the boot becomes the most attractive part of a woman, and in some morbid cases the woman herself is regarded as a comparatively unimportant appendage to her feet or her boots. The boots under civilized conditions much more frequently constitute the sexual symbol than do the feet themselves; this is not surprising since in ordinary life the feet are not often seen.

It is usually only under exceptionally favoring conditions that foot-fetichism occurs, as in the case recorded by Marandon de Montyel of a doctor who had been brought up in the West Indies. His mother had been insane and he himself was subject to obsessions, especially of being incapable of urinating; he had had nocturnal incontinence of urine in childhood. All the women of the people in the West Indies go about with naked feet, which are often beautiful. His puberty evolved under this influence, and foot-fetichism developed. He especially admired large, fat, arched feet, with delicate skin and large, regular toes. He masturbated with images of feet. At 15 he had relations with a colored chambermaid, but feared to mention his fetichism, though it was the touch of her feet that chiefly excited him. He now gave up masturbation, and had a succession of mistresses, but was always ashamed to confess his fancies until, at the age of 33, in Paris, a very intelligent woman who had become his mistress discovered his mania and skillfully enabled him to yield to it without shock to his modesty. He was devoted to this mistress, who had very beautiful feet (he had been horrified by the feet of Europeans generally), until she finally left him. (_Archives de Neurologie_, October, 1904.)

Probably the first case of shoe-fetichism ever recorded in any detail is that of Restif de la Bretonne (1734-1806), publicist and novelist, one of the most remarkable literary figures of the later eighteenth century in France. Restif was a neurotic subject, though not to an extreme degree, and his shoe-fetichism, though distinctly pronounced, was not pathological; that is to say, that the shoe was not itself an adequate gratification of the sexual impulse, but simply a highly important aid to tumescence, a prelude to the natural climax of detumescence; only occasionally, and *_faute de mieux_*, in the absence of the beloved person, was the shoe used as an adjunct to masturbation. In Restif's stories and elsewhere the attraction of the shoe is frequently discussed or used as a motive. His first decided literary success, *_Le Pied de Fanchette_*, was suggested by a vision of a girl with a charming foot, casually seen in the street. While all such passages in his books are really founded on his own personal feelings and experiences, in his elaborate autobiography, *_Monsieur Nicolas_*, he has frankly set forth the gradual evolution and cause of his idiosyncrasy. The first remembered trace dated from the age of 4, when he was able to recall having remarked the feet of a young girl in his native place. Restif was a sexually precocious youth, and at the age of 9, though both delicate in health and shy in manners, his thoughts were already absorbed in the girls around him. "While little Monsieur Nicolas," he tells us, "passed for a Narcissus, his thoughts, as soon as he was alone, by night or by day, had no other object than that sex he seemed to flee from. The girls most careful of their persons were naturally those who pleased him most, and as the part least easy to keep clean is that which touches the earth it was to the foot-gear that he mechanically gave his chief attention. Agathe, Reine, and especially Madeleine, were the most elegant of the girls at that time; their carefully selected and kept shoes, instead of laces or buckles, which were not yet worn at Sacy, had blue or rose ribbon, according to the color of the skirt. I thought of these girls with emotion; I desired--I knew not what; but I desired something, if it were only to subdue them." The origin Restif here assigns to his shoe-fetichism may seem paradoxical; he admired the girls who were most clean and neat in their dress, he tells us, and, therefore, paid most attention to that part of their clothing which was least clean and neat. But, however paradoxical the remark may seem, it is psychologically sound. All

fetichism is a kind of not necessarily morbid obsession, and as the careful work of Janet and others in that field has shown, an obsession is a fascinated attraction to some object or idea which gives the subject a kind of emotional shock by its contrast to his habitual moods or ideas. The ordinary morbid obsession cannot usually be harmoniously co-ordinated with the other experiences of the subject's daily life, and shows, therefore, no tendency to become pleasurable. Sexual fetichisms, on the other hand, have a reservoir of agreeable emotion to draw on, and are thus able to acquire both stability and harmony. It will also be seen that no element of masochism is involved in Restif's fetichism, though the mistake has been frequently made of supposing that these two manifestations are usually or even necessarily allied. Restif wishes to subject the girl who attracts him, he has no wish to be subjected by her. He was especially dazzled by a young girl from another town, whose shoes were of a fashionable cut, with buckles, "and who was a charming person besides." She was delicate as a fairy, and rendered his thoughts unfaithful to the robust beauties of his native Sacy. "No doubt," he remarks, "because, being frail and weak myself, it seemed to me that it would be easier to subdue her." "This taste for the beauty of the feet," he continues, "was so powerful in me that it unfailingly aroused desire and would have made me overlook ugliness. It is excessive in all those who have it." He admired the foot as well as the shoe: "The factitious taste for the shoe is only a reflection of that for pretty feet. When I entered a house and saw the boots arranged in a row, as is the custom, I would tremble with pleasure; I blushed and lowered my eyes as if in the presence of the girls themselves. With this vivacity of feeling and a voluptuousness of ideas inconceivable at the age of 10 I still fled, with an involuntary impulse of modesty, from the girls I adored."

We may clearly see how this combination of sensitive and precocious sexual ardor with extreme shyness, furnished the soil on which the germ of shoe-fetichism was able to gain a firm root and persist in some degree throughout a long life very largely given up to a pursuit of women, abnormal rather by its excessiveness than its perversity. A few years later, he tells us, he happened to see a pretty pair of shoes in a bootmaker's shop, and on hearing that they belonged to a girl whom at that time he reverently adored at a distance he blushed and nearly

fainted.

In 1749 he was for a time attracted to a young woman very much older than himself; he secretly carried away one of her slippers and kept it for a day; a little later he again took away a shoe of the same woman which had fascinated him when on her foot, and, he seems to imply, he used it to masturbate with.

Perhaps the chief passion of Restif's life was his love for Colette Parangon. He was still a boy (1752), she was the young and virtuous wife of the printer whose apprentice Restif was and in whose house he lived. Madame Parangon, a charming woman, as she is described, was not happily married, and she evidently felt a tender affection for the boy whose excessive love and reverence for her were not always successfully concealed. "Madonna Parangon," he tells us, "possessed a charm which I could never resist, a pretty little foot; it is a charm which arouses more than tenderness. Her shoes, made in Paris, had that voluptuous elegance which seems to communicate soul and life. Sometimes Colette wore shoes of simple white druggot or with silver flowers; sometimes rose-colored slippers with green heels, or green with rose heels; her supple feet, far from deforming her shoes, increased their grace and rendered the form more exciting." One day, on entering the house, he saw Madame Parangon elegantly dressed and wearing rose-colored shoes with tongues, and with green heels and a pretty rosette. They were new and she took them off to put on green slippers with rose heels and borders which he thought equally exciting. As soon as she had left the room, he continues, "carried away by the most impetuous passion and idolizing Colette, I seemed to see her and touch her in handling what she had just worn; my lips pressed one of these jewels, while the other, deceiving the sacred end of nature, from excess of exaltation replaced the object of sex (I cannot express myself more clearly). The warmth which she had communicated to the insensible object which had touched her still remained and gave a soul to it; a voluptuous cloud covered my eyes." He adds that he would kiss with rage and transport whatever had come in close contact with the woman he adored, and on one occasion eagerly pressed his lips to her cast-off underlinen, *_vela secretiora penetralium_*.

At this period Restif's foot-fetichism reached its highest point

of development. It was the aberration of a highly sensitive and very precocious boy. While the preoccupation with feet and shoes persisted throughout life, it never became a complete perversion and never replaced the normal end of sexual desire. His love for Madam Parangon, one of the deepest emotions in his whole life, was also the climax of his shoe-fetichism. She represented his ideal woman, an ethereal sylph with wasp-waist and a child's feet; it was always his highest praise for a woman that she resembled Madame Parangon, and he desired that her slipper should be buried with him. (Restif de la Bretonne, *Monsieur Nicolas*, vols. i-iv, vol. xiii, p. 5; id., *Mes Inscriptions*, pp. ci-cv.)

Shoe-fetichism, more especially if we include under this term all the cases of real or pseudo-masochism in which an attraction to the boots or slippers is the chief feature, is a not infrequent phenomenon, and is certainly the most frequently occurring form of fetichism. Many cases are brought together by Krafft-Ebing in his *Psychopathia Sexualis*. Every prostitute of any experience has known men who merely desire to gaze at her shoes, or possibly to lick them, and who are quite willing to pay for this privilege. In London such a person is known as a "bootman," in Germany as a "Stiefelfrier."

The predominance of the foot as a focus of sexual attraction, while among us to-day it is a not uncommon phenomenon, is still not sufficiently common to be called normal; the majority of even ardent lovers do not experience this attraction in any marked degree. But these manifestations of foot-fetichism which with us to-day are abnormal, even when they are not so extreme as to be morbid, may perhaps become more intelligible to us when we realize that in earlier periods of civilization, and even to-day in some parts of the world, the foot is generally recognized as a focus of sexual attraction, so that some degree of foot-fetichism becomes a normal phenomenon.

The most pronounced and the best known example of such normal foot-fetichism at the present day is certainly to be found among the Southern Chinese. For a Chinese husband his wife's foot is more interesting than her face. A Chinese woman is as shy of showing her feet to a man as a European woman her breasts; they are reserved for her husband's eyes alone, and to look at a woman's feet in the street is highly improper and indelicate. Chinese foot-fetichism is connected with the custom of compressing the feet. This custom appears to rest on the

fact that Chinese women naturally possess a very small foot and is thus an example of the universal tendency in the search for beauty to accentuate, even by deformation, the racial characteristics. But there is more than this. Beauty is largely a name for sexual attractiveness, and the energy expended in the effort to make the Chinese woman's small foot still smaller is a measure of the sexual fascination which it exerts. The practice arose on the basis of the sexual attractiveness of the foot, though it has doubtless served to heighten that attractiveness, just as the small waist, which (if we may follow Stratz) is a characteristic beauty of the European woman, becomes to the average European man still more attractive when accentuated, even to the extent of deformity, by the compression of the corset.

Referring to the sexual fascination exerted by the foot in China, Matignon writes: "My attention has been drawn to this point by a large number of pornographic engravings, of which the Chinese are very fond. In all these lascivious scenes we see the male voluptuously fondling the woman's foot. When a Celestial takes into his hand a woman's foot, especially if it is very small, the effect upon him is precisely the same as is provoked in a European by the palpation of a young and firm bosom. All the Celestials whom I have interrogated on this point have replied unanimously: 'Oh, a little foot! You Europeans cannot understand how exquisite, how sweet, how exciting it is!' The contact of the genital organ with the little foot produces in the male an indescribable degree of voluptuous feeling, and women skilled in love know that to arouse the ardor of their lovers a better method than all Chinese aphrodisiacs--including 'giusen' and swallows' nests--is to take the penis between their feet. It is not rare to find Chinese Christians accusing themselves at confession of having had 'evil thoughts on looking at a woman's foot.'" (Dr. J. Matignon, "A propos d'un Pied de Chinoise," _Archives d'Anthropologie Criminelle_, 1898.)

It is said that a Chinese Empress, noted for her vice and having a congenital club foot, about the year 1100 B.C., desired all women to resemble her, and that the practice of compressing the foot thus arose. But this is only tradition, since, in 300 B.C., Chinese books were destroyed (Morache, Art. "Chine," _Dictionnaire Encyclopedique des Sciences Medicales_, p. 191). It is also said that the practice owes its origin to the wish to keep women indoors. But women are not secluded in China, nor does

foot compression usually render a woman unable to walk. Many intelligent Chinese are of opinion that its object is to promote the development of the sexual parts and of the thighs, and so to aid both intercourse and parturition. There is no ground for believing that it has any such influence, though Morache found that the mons veneris and labia are largely developed in Chinese women, and not in Tartar women living in Pekin (who do not compress the foot). If there is any correlation between the feet and the pelvic regions, it is more probably congenital than due to the artificial compression of the feet. The ancients seem to have believed that a small foot indicated a small vagina. Restif de la Bretonne, who had ample opportunities for forming an opinion on a matter in which he took so great an interest, believed that a small foot, round and short, indicated a large vagina (*Monsieur Nicolas*, vol. i, reprint of 1883, p. 92). Even, however, if we admit that there is a real correlation between the foot and the vagina, that would by no means suffice to render the foot a focus of sexual attraction.

It remains the most reasonable view that the foot bandage must be regarded as strictly analogous to the waist bandage or corset which also tends to produce deformity of the constricted region. Stratz has ingeniously remarked (*Frauenkleidung*, third edition, p. 101) that the success of the Chinese in dwarfing trees may have suggested a similar attempt in regard to women's feet, and adds that in any case both dwarfed trees and bound feet bear witness in the Mongolian to the same love for small and elegant, not to say deformed, things. For a Chinaman the deformed foot is a "golden water-lily."

Many facts (together with illustrations) bearing on Chinese deformation of the foot will be found in Ploss, *Das Weib*, vol. i, Section IV.

The significance of the sexual emotion aroused by the female foot in China and the origin of its compression begin to become clear when we realize that this foot-fetichism is merely an extreme development of a tendency which is fairly well marked among nearly all the peoples of yellow race. Jacoby, who has brought together a number of interesting facts bearing on the sexual significance of the foot, states that a similar tendency is to be found among the Mongol and Turk peoples of Siberia, and in the east and central parts of European Russia, among the Permiaks, the Wotiaks, etc.

Here the woman, at all events when young, has always her feet, as well as head, covered, however little clothing she may otherwise wear.

"On hot nights or on baking days," Jacoby states, "you may see these women with uncovered breasts, or even entirely naked without embarrassment, but you will never see them with bare feet, and no male relations, except the husband, will ever see the feet and lower part of the legs of the women in the house. These women have their modesty in their feet, and also their coquetry; to unbind the feet of a woman is for a man a voluptuous act, and the touch of the bands produces the same effect as a corset still warm from a woman's body on a European man. A woman's beauty, that which attracts and excites a man, lies in her foot; in Mordvin love poems celebrating the beauty of women there is much about her attire, especially her embroidered chemise, but as regards the charms of her person the poet is content to state that 'her feet are beautiful;' with that everything is said. The young peasant woman of the central provinces as part of her holiday raiment puts on great woollen stockings which come up to the groin and are then folded over to below the knee. To uncover the feet of a person of the opposite sex is a sexual act, and has thus become the symbol of sexual possession, so that the stocking or foot-gear became the emblem of marriage, as later the ring. (It was so among the Jews, as we see in the book of *Ruth*, Chapter III, v. 4, and Chapter IV, vv. 7 and 8). St. Vladimir the Great asked in marriage the daughter of Prince Rogvold; as Vladimir's mother had been a serf, the princess proudly replied that she 'would not uncover the feet of a slave.' At the present time in the east of Russia when a young girl tries to find out by divination whom she will have as a husband the traditional formula is 'Come and take my stockings off.' Among the populations of the north and east, it is sometimes the bride who must do this for her husband on the wedding night, and sometimes the bridegroom for his wife, not as a token of love, but as a nuptial ceremony. Among the professional classes and small nobility in Russia parents place money in the stocking of their child at marriage as a present for the other partner, it being supposed that the couple mutually remove each other's foot raiment, as an act of sexual possession, the emblem of coitus." (Paul Jacoby, *Archives d'Anthropologie Criminelle*, December, 1903, p. 793.) The practice among ourselves of children hanging up their stockings at night for

presents would seem to be a relic of the last-mentioned custom.

While we may witness the sexual symbolism of the foot, with or without an associated foot-fetichism, most highly developed in Asia and Eastern Europe, it has by no means been altogether unknown in some stages of western civilization, and traces of it may be found here and there even yet. Schinz refers to the connection between the feet and sexual pleasure as existing not only among the Egyptians and the Arabs, but among the ancient Germans and the modern Spaniards,[16] while Jacoby points out that among the Greeks, the Romans, and especially the Etruscans, it was usual to represent chaste and virgin goddesses with their feet covered, even though they might be otherwise nude. Ovid, again, is never weary of dwelling on the sexual charm of the feminine foot. He represents the chaste matron as wearing a weighted *_stola_* which always fell so as to cover her feet; it was only the courtesan, or the nymph who is taking part in an erotic festival, who appears with raised robes, revealing her feet.[17] So grave a historian as Strabo, as well as Aelian, refers to the story of the courtesan Rhodope whose sandal was carried off by an eagle and dropped in the King of Egypt's lap as he was administering justice, so that he could not rest until he had discovered to whom this delicately small sandal belonged, and finally made her his queen. Kleinpaul, who repeats this story, has collected many European sayings and customs (including Turkish), indicating that the slipper is a very ancient symbol of a woman's sexual parts.[18]

In Rome, Dufour remarks, "Matrons having appropriated the use of the shoe (*_soccus_*) prostitutes were not allowed to use it, and were obliged to have their feet always naked in sandals or slippers (*_crepida_* and *_solea_*), which they fastened over the instep with gilt bands. Tibullus delights to describe his mistress's little foot, compressed by the band that imprisoned it: *_Ansaque compressos colligat arcta pedes_*. Nudity of the foot in woman was a sign of prostitution, and their brilliant whiteness acted afar as a pimp to attract looks and desires." (Dufour, *_Histoire de la Prostitution_*, vol. II., ch. xviii.)

This feeling seems to have survived in a more or less vague and unconscious form in mediaeval Europe. "In the tenth century," according to Dufour (*_Histoire de la Prostitution_*, vol. VI., p. 11), "shoes *_a la poulaine_*, with a claw or beak, pursued for more than four centuries by the anathemas of popes and the invectives of preachers, were always regarded by mediaeval

casuists as the most abominable emblems of immodesty. At a first glance it is not easy to see why these shoes--terminating in a lion's claw, an eagle's beak, the prow of a ship, or other metal appendage--should be so scandalous. The excommunication inflicted on this kind of foot-gear preceded the impudent invention of some libertine, who wore poulaines in the shape of the phallus, a custom adopted also by women. This kind of poulaine was denounced as mandite de Dicu (Ducange's Glossary, at the word Poulainia) and prohibited by royal ordinances (see letter of Charles V., 17 October, 1367, regarding the garments of the women of Montpellier). Great lords and ladies continued, however, to wear poulaines." In Louis XL's court they were still worn of a quarter of an ell in length.

Spain, ever tenacious of ancient ideas, appears to have preserved longer than other countries the ancient classic traditions in regard to the foot as a focus of modesty and an object of sexual attraction. In Spanish religious pictures it was always necessary that the Virgin's feet should be concealed, the clergy ordaining that her robe should be long and flowing, so that the feet might be covered with decent folds. Pacheco, the master and father-in-law of Velasquez, writes in 1649 in his Arte de la Pintura: "What can be more foreign from the respect which we owe to the purity of Our Lady the Virgin than to paint her sitting down with one of her knees placed over the other, and often with her sacred feet uncovered and naked. Let thanks be given to the Holy Inquisition which commands that this liberty should be corrected!" It was Pacheco's duty in Seville to see that these commands were obeyed. At the court of Philip IV. at this time the princesses never showed their feet, as we may see in the pictures of Velasquez. When a local manufacturer desired to present that monarch's second bride, Mariana of Austria, with some silk stockings the offer was indignantly rejected by the Court Chamberlain: "The Queen of Spain has no legs!" Philip V.'s, queen was thrown from her horse and dragged by the feet; no one ventured to interfere until two gentlemen bravely rescued her and then fled, dreading punishment by the king: they were, however, graciously pardoned. Reinach ("Pieds Pudiques," Cultes, Mythes et Religions, pp. 105-110) brings together several passages from the Countess D'Aulnoy's account of the Madrid Court in the seventeenth century and from other sources, showing how careful Spanish ladies were as regards their feet, and how jealous

Spanish husbands were in this matter. At this time, when Spanish influence was considerable, the fashion of Spain seems to have spread to other countries. One may note that in Vandyck's pictures of English beauties the feet are not visible, though in the more characteristically English painters of a somewhat later age it became usual to display them conspicuously, while the French custom in this matter is the farthest removed from the Spanish. At the present day a well-bred Spanish woman shows as little as possible of her feet in walking, and even in some of the most characteristic Spanish dances there is little or no kicking, and the feet may even be invisible throughout. It is noteworthy that in numerous figures of Spanish women (probably artists' models) reproduced in Ploss's *Das Weib* the stockings are worn, although the women are otherwise, in most cases, quite naked. Max Dessoir mentions ("Psychologie der Vita Sexualis," *Zeitschrift fuer Psychiatrie*, 1894, p. 954) that in Spanish pornographic photographs women always have their shoes on, and he considers this an indication of perversity. I have seen the statement (attributed to Gautier's *Voyage en Espagne*, where, however, it does not occur) that Spanish prostitutes uncover their feet in sign of assent, and Madame d'Aulnoy stated that in her time to show her lover her feet was a Spanish woman's final favor.

The tendency, which we thus find to be normal at some earlier periods of civilization, to insist on the sexual symbolism of the feminine foot or its coverings, and to regard them as a special sexual fascination, is not without significance for the interpretation of the sporadic manifestations of foot-fetichism among ourselves. Eccentric as foot-fetichism may appear to us, it is simply the re-emergence, by a pseudo-atavism or arrest of development, of a mental or emotional impulse which was probably experienced by our forefathers, and is often traceable among young children to-day.[19] The occasional reappearance of this bygone impulse and the stability which it may acquire are thus conditioned by the sensitive reaction of an abnormally nervous and usually precocious organism to influences which, among the average and ordinary population of Europe to-day, are either never felt, or quickly outgrown, or very strictly subordinated in the highly complex crystallizations which the course of love and the process of tumescence create within us.

It may be added that this is by no means true of foot-fetichism only. In some other fetichisms a seemingly congenital

predisposition is even more marked. This is not only the case as regards hair-fetichism and fur-fetichism (see, e.g., Krafft-Ebing, *_Psychopathia Sexualis_*, English translation of tenth edition, pp. 233, 255, 262). In many cases of fetichisms of all kinds not only is there no record of any commencement in a definite episode (an absence which may be accounted for by the supposition that the original incident has been forgotten), but it would seem in some cases that the fetichism developed very slowly.

In this sense, it will be seen, although it is hazardous to speak of foot-fetichism as strictly an atavism, it may certainly be said to arise on a congenital basis. It represents the rare development of an inborn germ, usually latent among ourselves, which in earlier stages of civilization frequently reached a normal and general fruition.

It is of interest to emphasize this congenital element of foot symbolism, because more than any other forms of sexual perversion the fetichisms are those which are most vaguely conditioned by inborn states of the organism and most definitely aroused by seemingly accidental associations or shocks in early life. Inversion is sometimes so fundamentally ingrained in the individual's constitution that it arises and develops in spite of the very strongest influence in a contrary direction. But a fetichism, while it tends to occur in sensitive, nervous, timid, precocious individuals--that is to say, individuals of more or less neuropathic heredity--can usually, though not always, be traced to a definite starting point in the shock of some sexually emotional episode in early life.

A few examples of the influences of such association may here be given, referring miscellaneously to various forms of erotic symbolism. Magnan has recorded the case of a hair-fetichist, living in a district where the women wore their hair done up, who at the age of 15 experienced pleasurable feelings with erection at the sight of a village beauty combing her hair; from that time flowing hair became his fetich, and he could not resist the temptation to touch it and if possible sever it, thus becoming a hair-despoiler, for which he was arrested but not sentenced. (*_Archives de l'Anthropologie Criminelle_*, vol. v, No. 28.)

I have elsewhere recorded the history of a boy of 14, having already had imperfect connection with a grown-up woman, who associated much with a young married lady; he had no sexual

relations with her, but one day she urinated in his presence, and he saw that her mons veneris was covered by very thick hair; from that time he worshiped this woman in secret and acquired a life-long fetichistic attraction to women whose pubic hair was similarly abundant (*_Studies in the Psychology of Sex_*, vol. iii, Appendix B, History V).

Roubaud reported the case of a general's son, sexually initiated at the age of 14 by a blonde young lady of 21 who, in order to avoid detection, always retained her clothing: gaiters, a corset and a silk dress; when the boy's studies were completed and he was sent to a garrison where he could enjoy freedom he found that his sexual desires could only be aroused by blonde women dressed like the lady who had first aroused his sexual desires; consequently he gave up all thoughts of matrimony, as a woman in nightclothes produced impotence (*_Traite de l'Impuissance_*, p. 439). Krafft-Ebing records the somewhat similar case of a nervous Polish boy of old family seduced at the age of 17 by a French governess, who during several months practiced mutual masturbation with him; in this way his attention became attracted by her very elegant boots, and in the end he became a confirmed boot-fetichist (*_Psychopathia Sexualis_*, English translation, p. 249).

A boy of 7, of bad heredity, was taught to masturbate by a servant girl; on one occasion she practiced this on him with her foot without taking off her shoe; it was the first time the manoeuvre gave him any pleasure, and an association was thus established which led to shoe-fetichism (Hammond, *_Sexual Impotence_*, p. 44). A government official whose first coitus in youth took place on a staircase; the sound of his partner's creaking shoes against the stairs, produced by her efforts to accelerate orgasm, formed an association which developed into an auditory shoe-fetichism; in the streets he was compelled to follow ladies whose shoes creaked, ejaculation being thus produced, while to obtain complete satisfaction he would make a prostitute, otherwise naked, sit in front of him in her shoes, moving her feet so that the shoes creaked. (Moraglia, *_Archivio di Psichiatria_*, vol. xiii, p. 568.)

Bechterew, in St. Petersburg, has recorded the case of a man who when a child used to fall asleep at the knees of his nurse with

his head buried in the folds of her apron; in this position he first experienced erection and voluptuous sensations; when a youth he had no attraction to naked women, and in real life and in dreams was only excited sexually under conditions recalling his early experience; in his relations with women he preferred them dressed, and was excited by the rustling sound of their skirts; in this case there was no traceable neuropathic taint nor any other personal peculiarity. (Summarized in *_Journal de Psychologie Normale et Pathologique_*, January-February, 1904, p. 72.)

In a curious case recorded in detail by Moll, a philologist of sensitive temperament but sound heredity, who had always been fond of flowers, at the age of 21 became engaged to a young lady who wore large roses fastened in her jacket; from this time roses became to him a sexual fetich, to kiss them caused erection, and his erotic dreams were accompanied by visions of roses and the hallucination of their odor; the engagement was finally broken off and the rose-fetichism disappeared (*_Untersuchungen ueber Libido Sexualis_*, bd. i, p. 540).

Such associations may naturally occur in the early experiences of even the most normal persons. The degree to which they will influence the subsequent life and thought and feeling depends on the degree of the individual's morbid emotional receptivity, on the extent to which he is hereditarily susceptible of abnormal deviation. Precocity is undoubtedly a condition which favors such deviation; a child who is precociously and abnormally sensitive to persons of the opposite sex before puberty has established the normal channels of sexual desire, is peculiarly liable to become the prey of a chance symbolism. All degrees of such symbolism are possible. While the average insensitive person may fail to perceive them at all, for the more alert and imaginative lover they are a fascinating part of the highly charged crystallization of passion. A more nervously exceptional person, when once such a symbolism has become firmly implanted, may find it an absolutely essential element in the charm of a beloved and charming person. Finally, for the individual who is thoroughly unsound the symbol becomes generalized; a person is no longer desired at all, being merely regarded as an appendage of the symbol, or being dispensed with altogether; the symbol is alone desired, and is fully adequate to impart by itself complete sexual gratification. While it must be considered a morbid state to demand a symbol as an almost essential part of the charm of a desired person, it is only in the final condition,

in which the symbol becomes all-sufficing, that we have a true and complete perversion. In the less complete forms of symbolism it is still the woman who is desired, and the ends of procreation may be served; when the woman is ignored and the mere symbol is an adequate and even preferred stimulus to detumescence the pathological condition becomes complete.

Krafft-Ebing regarded shoe-fetichism as, in large measure, a more or less latent form of masochism, the foot or the shoe being the symbol of the subjection and humiliation which the masochist feels in the presence of the beloved object. Moll is also inclined to accept such a connection.

"The very numerous class of boot-and-shoe-fetichists," Krafft-Ebing wrote, "forms the transition to the manifestations of another independent perversion, i.e., fetichism itself; but it stands in closer relationship to the former.... It is highly probable, and shown by a correct classification of the observed cases, that the majority, and perhaps all of the cases of shoe-fetichism, rest upon a basis of more or less conscious masochistic desire for self-humiliation.... The majority or all may be looked upon as instances of latent masochism (the motive remaining unconscious) in which the _female foot or shoe, as the masochist's fetich_, has acquired an independent significance." (_Psychopathia Sexualis_, English translation of tenth edition, pp. 159, et seq.) "Though Krafft-Ebing may not have cleared up the whole matter," Moll remarks, "I regard his deductions concerning the connection of foot-and-shoe fetichism to masochism as the most important progress that has been made in the theoretic study of sexual perversions.... In any case, the connection is very frequent." (_Kontraere Sexualempfindung_, third edition, p. 306.)

It is quite easy to see that this supposed identity of masochism and foot-fetichism forms a seductive theory. It is also undoubtedly true that a masochist may very easily be inclined to find in his mistress's foot an aid to the ecstatic self-abnegation which he desires to attain.[20] But only confusion is attained by any general attempt to amalgamate masochism and foot-fetichism. In the broad sense in which erotic symbolism is here understood, both masochism and foot-fetichism may be coordinated as symbolisms; for the masochist his self-humiliating impulses are the symbol of ecstatic adoration; for the foot-fetichist his mistress's foot or shoe is the concentrated symbol of all that is most beautiful and elegant and feminine in her personality. But if in this sense they are coordinated,

they remain entirely distinct and have not even any necessary tendency to become merged. Masochism merely simulates foot-fetichism; for the masochist the boot is not strictly a symbol, it is only an instrument which enables him to carry out his impulse; the true sexual symbol for him is not the boot, but the emotion of self-subjection. For the foot-fetichist, on the other hand, the foot or the shoe is not a mere instrument, but a true symbol; the focus of his worship, an idealized object which he is content to contemplate or reverently touch. He has no necessary impulse to any self-degrading action, nor any constant emotion of subjection. It may be noted that in the very typical case of foot-fetichism which is presented to us in the person of Restif de la Bretonne (*_ante_*, p. 18), he repeatedly speaks of "subjecting" the woman for whom he feels this fetichistic adoration, and mentions that even when still a child he especially admired a delicate and fairy-like girl in this respect because she seemed to him easier to subjugate. Throughout life Restif's attitude toward women was active and masculine, without the slightest trace of masochism.[21]

To suppose that a fetichistic admiration of his mistress's foot is due to a lover's latent desire to be kicked, is as unreasonable as it would be to suppose that a fetichistic admiration for her hand indicated a latent desire to have his ears boxed. In determining whether we are concerned with a case of foot-fetichism or of masochism we must take into consideration the whole of the subject's mental and emotional attitude. An act, however definite, will not suffice as a criterion, for the same act in different persons may have altogether different implications. To amalgamate the two is the result of inadequate psychological analysis and only leads to confusion.

It is, however, often very difficult to decide whether we are dealing with a case which is predominantly one of masochism or of foot-fetichism. The nature of the action desired, as we have seen, will not suffice to determine the psychological character of the perversion. Krafft-Ebing believed that the desire to be trodden on, very frequently experienced by masochists, is absolutely symptomatic of masochism.[22] This is scarcely the case. The desire to be trodden on may be fundamentally an erotic symbolism, closely approaching foot-fetichism, and such slight indications of masochism as appear may be merely a parasitic growth on the symbolism, a growth perhaps more suggested by the circumstances involved in the gratification of the abnormal desire than inherent in the innate impulse of the subject. This may be illustrated by the interesting case of a very intelligent man with whom I am well acquainted.

C.P., aged 38. Heredity good. Parents both healthy and normal. Several children of the marriage, all sexually normal so far as is known. C.P. is the youngest of the family and separated from the others by an interval of many years. He was a seven-months' child. He has always enjoyed good health and is active and vigorous, both mentally and physically.

From the age of 9 or 10 to 14 he masturbated occasionally for the sake of physical relief, having discovered the act for himself. He was, however, quite innocent and knew nothing of sexual matters, never having been initiated either by servants or by other boys.

"When I encounter a woman who very strongly attracts me and whom I very greatly admire," he writes, "my desire is never that I may have sexual connection with her in the ordinary sense, but that I may lie down upon the floor on my back and be trampled upon by her. This curious desire is seldom present unless the object of my admiration is really a lady, and of fine proportions. She must be richly dressed--preferably in an evening gown, and wear dainty high-heeled slippers, either quite open so as to show the curve of the instep, or with only one strap or 'bar' across. The skirts should be raised sufficiently to afford me the pleasure of seeing her feet and a liberal amount of ankle, but in no case above the knee, or the effect is greatly reduced. Although I often greatly admire a woman's intellect and even person, sexually no other part of her has any serious attraction for me except the leg, from the knee downwards, and the foot, and these must be exquisitely clothed. Given this condition, my desire amounts to a wish to gratify my sexual sense by contact with the (to me) attractive part of the woman. Comparatively few women have a leg or foot sufficiently beautiful to my mind to excite any serious or compelling desire, but when this is so, or I suspect it, I am willing to spend any time or trouble to get her to tread upon me and am anxious to be trampled on with the greatest severity.

"The treading should be inflicted for a few minutes all over the chest, abdomen and groin, and lastly on the penis, which is, of course, lying along the belly in a violent state of erection, and consequently too hard for the treading to damage it. I also enjoy being nearly strangled by a woman's foot.

"If the lady finally stands facing my head and places her slipper upon my penis so that the high heel falls about where the penis leaves the scrotum, the sole covering most of the rest of it and with the other foot upon the abdomen, into which I can _see_ as well as feel it sink as she shifts her weight from one foot to the other, orgasm takes place almost at once. Emission under these conditions is to me an agony of delight, during which practically the lady's whole weight should rest upon the penis.

"One reason for my special pleasure in this method seems to be that first the heel and afterwards the sole of the slipper as it treads upon the penis greatly check the passage of the semen and consequently the pleasure is considerably prolonged. There is also a curious mental side to the affair. I love to imagine that the lady who is treading upon me is my mistress and I her slave, and that she is doing it to punish me for some fault, or to give _herself_ (not me) pleasure.

"It follows that the greater the contempt and severity with which I am 'punished,' the greater becomes my pleasure. The idea of 'punishment' or 'slavery' is seldom aroused except when I have great difficulty in accomplishing my desire and the treader is more than usually handsome and heavy and the trampling mercilessly inflicted. I have been trampled so long and so mercilessly several times, that I have flinched each time the slipper pressed its way into my aching body and have been black and blue for days afterwards. I take the greatest interest in leading ladies on to do this for me where I think I will not offend, and have been surprisingly successful. I must have lain beneath the feet of quite a hundred women, many of them of good social position, who would never dream of permitting any ordinary sexual intercourse, but who have been so interested or amused by the idea as to do it for me--many of them over and over again. It is perhaps needless to say that none of my own or the ladies' clothing is ever removed, or disarranged, for the accomplishment of orgasm in this manner. After a long and varied experience, I may say that my favorite weight is 10 to 11 stone, and that black, very high-heeled slippers, in combination with tan silk stockings, seem to give me the greatest pleasure and create in me the strongest desires.

"Boots, or outdoor shoes, do not attract me to anything like the same degree, although I have, upon several occasions, enjoyed myself fairly well by their use. Nude women repel me, and I find no pleasure in seeing a woman in tights. I am not averse to normal sexual connection and occasionally employ it. To me, however, the pleasure is far inferior to that of being trampled upon. I also derive keen pleasure--and usually have a strong erection--from seeing a woman, dressed as I have described, tread upon anything which yields under her foot--such as the seat of a carriage, the cushions of a punt, a footstool, etc., and I enjoy seeing her crush flowers by treading upon them. I have often strolled along in the wake of some handsome lady at a picnic or garden party, for the pleasure of seeing the grass upon which she has trodden rise slowly again after her foot has pressed it. I delight also to see a carriage sway as a woman leaves or enters it--anything which needs the pressure of the foot.

"To pass now to the origin of this direction of my feelings.

"Even in early childhood I admired pretty feminine foot-gear, and in the contemplation of it experienced vague sensations which I now recognize as sexual. When a lad of 14 or so, I stayed a good deal at the house of some intimate friends of my parents, the daughter of the house--an only child--a beautiful and powerful girl, about six years my senior, being my special chum. This girl was always daintily dressed, and having most lovely feet and ankles not unnaturally knew it. Whenever possible she dressed so as to show off their beauty to the best advantage--rather short skirts and usually little high-heeled slippers--and was not averse to showing them in a most distractingly coquettish manner. She seemed to have a passion for treading upon things which would scrunch or yield under her foot, such as flowers, little windfallen apples and pears, acorns, etc., or heaps of hay, straw or cut grass. As we wandered about the gardens--for we were left to do exactly as we liked--I got quite accustomed to seeing her hunt out and tread upon such things, and used to chaff her about it. At that time I was--as I am still--fond of lying at full length on a thick hearthrug before a good fire. One evening as I was lying in this way and we were alone, A. crossed the room to reach a bangle from the mantelpiece. Instead of reaching over me, she playfully stepped upon my body, saying that she would show me how the hay and straw felt. Naturally I fell in with the joke and

laughed. After standing upon me a few moments she raised her skirt slightly and, holding on to the mantelpiece for support, stretched out one dainty foot in its brown silk stocking and high-heeled slipper to the blaze to warm, while looking down and laughing at my scarlet, excited face. She was a perfectly frank and charming girl, and I feel pretty certain that, although she evidently enjoyed my excitement and the feeling of my body yielding under her feet, she did not on this first occasion clearly understand my condition; nor can I remember that, though the desire for sexual gratification drove me nearly mad, it appeared to awaken in her any reciprocal feeling. I took hold of her raised foot and, after kissing it, guided it by an absolutely irresistible impulse on to my penis, which was as hard as wood and seemed almost bursting. Almost at the moment that her weight was thrown upon it, orgasm took place for the first time in my life thoroughly and effectively. No description can give any idea of what I felt--I only know that from that moment my distorted sexual focus was fixed forever. Numberless times, after that evening, I felt the weight of her dainty slippers, and nothing will ever cause the memory of the pleasure she thus gave me to fade. I know that A. came to enjoy treading upon me, as much as I enjoyed having her do it. She had a liberal dress allowance and, seeing the pleasure they gave me, she was always buying pretty stockings and ravishing slippers with the highest and most slender Louis heels she could find and would show them to me with the greatest glee, urging me to lie down that she might try them on me. She confessed that she loved to see and feel them sink into my body as she trod upon me and enjoyed the crunch of the muscles under her heel as she moved about. After some minutes of this, I always guided her slipper on to my penis, and she would tread carefully, but with her whole weight--probably about 9 stone--and watch me with flashing eyes, flushed cheeks, and quivering lips, as she felt--as she must have done plainly--the throbbing and swelling of my penis under her foot as emission took place. I have not the smallest doubt that orgasm took place simultaneously with her, though we never at any time spoke openly of it. This went on for several years on almost every favorable opportunity we had, and after a month or two of separation sometimes four or five times during a single day. Several times during A.'s absence I masturbated by getting her slipper and pressing it with all my strength against the penis while imagining that she was treading upon me. The pleasure was, of

course, very inferior to her attentions. There was never at any time between us any question of normal sexual intercourse, and we were both well content to let things drift as they were.

"A little after 20 I went abroad, and on my return about three years later I found her married. Although we met often, the subject was never alluded to, though we remained firm friends. I confess I often, when I could do so without being seen, looked longingly at her feet and would have gladly accepted the pleasure she could have given me by an occasional resumption of our strange practice--but it never came.

"I went abroad again, and now neither she nor her husband are alive and leave no issue. From time to time I have had occasional relations with prostitutes, but always in this manner, though I much prefer to find some lady of or above my own social position who will do the treading for me. This is, however, interestingly difficult.

"Out of say a hundred women (which at home and abroad is what I should estimate must have stood upon my body) I should say quite 80 or 85 were not prostitutes. Certainly not more than 10 to 12 shared any sexual excitement, but while they were evidently excited they were not gratified. A. alone, so far as I know, had complete sexual satisfaction of it. I have never asked a woman in so many words to tread upon me for the purpose of gratifying my sexual desires (prostitutes excepted), but have always tempted them to do it in a jocular or teasing manner, and it is very doubtful if more than a few (married) women really understood, even after they had given me the extreme pleasure, that they had done so, because any flushing and movement on my part under their feet was not unnaturally put down to the trampling to which they were subjecting me, and it was easy for me to guide the foot as often as was necessary on to the penis till orgasm took place, and even to keep it there by laying hold of the other one to kiss it or on some other pretext during emission. Of course many understood after once doing it (most have done it only once) what I was at, and, although they did not ever discuss it nor did I, they were not unwilling to give me as many treadings as I cared to playfully suggest. I don't think they got any pleasure sexually out of it themselves, though they could see plainly that I did, and they did not object to give it me. I have spent as

long as twelve months with some women working gradually nearer and nearer to my desire--often getting what I want in the end, but more often failing. I never risk it till I am certain it would be safe to ask it, and have never had a serious rebuff. In very many cases I should say the doing of what I want has simply been regarded by the woman as gratifying a silly and perhaps amusing whim, in which, beyond the novelty of treading on a man's body, she has taken but little interest.

"As in normal seduction, the endeavor to win the woman over to do what I want without arousing her antagonism is a great part of the charm to me, and naturally the better her social position the more difficult this becomes--and the more attractive. I have found that in three instances prostitutes have performed the same office for other men and knew all about it. It is not uninteresting to note that these three women were all of fine, massive build--one standing about 5 feet 10 inches and weighing nearly 14 stone--but with comparatively uninteresting faces. The weight, build and clothing count for a good deal in exciting me. I find that a sudden check to a man at the supreme moment of sexual pleasure tends to heighten and prolong the pleasure. My physical satisfaction is due to the fact that by getting the lady to stand with all her weight upon my penis (as it lies between her foot and the soft bed of my own body into which it is deeply pressed) the act of emission is enormously prolonged, with corresponding enjoyment. For this reason also I prefer a very high-heeled slipper. The seminal fluid has to be forced past two separate obstacles--the pressure of the heel close at the root of the penis and afterwards the ball of the foot which compresses the outer half, leaving a free portion between them under the arched sole of the slipper. I may add that the pleasure is greatly increased by the retention of the urine, and I always try to retain as much water as I dare. I have an unconquerable aversion to red in slippers or stockings; it will even cause impotence. Why, I know not. Strange as it may seem, although pain and bruising are often inflicted by a severe treading, I have never been in any way injured by the practice, and my pleasure in it seems not to diminish by constant repetition. The comparative difficulty of obtaining the pleasure from just the woman I want has a never-ending, if inexplicable, charm for me."

It will be observed that in this case special importance is

attached to shoes with high heels, and the subject considers that the pressure of such shoes is for mechanical reasons most favorable for procuring ejaculation. Nearly all heterosexual shoe-fetichists seem, however, to be equally attracted by high heels. Restif de la Bretonne frequently referred to this point, and he gave a number of reasons for the attractiveness of high heels: (1) They are unlike men's boots and, therefore, have a sexual fascination; (2) they make the leg and foot look more charming; (3) they give a less bold and more sylph-like character to the walk; (4) they keep the feet clean. (Restif de la Bretonne, *_Nuits de Paris_*, vol. v, quoted in Preface to his *_Mes Inscriptions_*, p. ciii.) It is doubtless the first reason--the fact that high heels are a kind of secondary sexual character--which is most generally potent in this attraction.

The foregoing history, while it very distinctly brings before us a case of erotic symbolism, is not strictly an example of shoe-fetichism. The symbolism is more complex. The focus of beauty in a desirable woman is transferred and concentrated in the region below the knee; in that sense we have foot-fetichism. But the act of coitus itself is also symbolically transferred. Not only has the foot become the symbol of the vulva, but trampling has become the symbol of coitus; intercourse takes place symbolically *_per pedem_*. It is a result of this symbolization of the foot and of trampling that all acts of treading take on a new and symbolical sexual charm. The element of masochism--of pleasure in being a woman's slave--is a parasitic growth; that is to say, it is not founded in the subject's constitution, but chances to have found a favorable soil in the special circumstances under which his sexual life developed. It is not primary, but secondary, and remains an unimportant and merely occasional element.

It may be instructive to bring forward for comparison a case in which also we have a symbolism involving boot-fetichism, but extending beyond it. In this case there is a basis of inversion (as is not infrequent in erotic symbolisms), but from the present point of view the psychological significance of the case remains the same.

A.N., aged 29, unmarried, healthy, though not robust, and without any known hereditary taint. Has followed various avocations without taking great interest in them, but has shown some literary ability.

"I am an Englishman," his own narrative runs, "the third of three children. At my birth my father was 41 and my mother 34. My mother died of cancer when I was 15. My father is still alive, a reserved man, who still nurses his sorrow for his wife's death. I have no reason to believe my parents anything but normal and useful members of society. My sister is normal and happily married. My brother I have reason to believe to be an invert.

"A horoscope cast for me describes me in a way I think correct, and so do my friends: 'A mild, obliging, gentle, amiable person, with many fine traits of character; timid in nature, fond of society, loving peace and quietude, delighting in warm and close friendships. There is much that is firm, steadfast and industrious, some self-love, a good deal of diplomacy, a little that is subtle, or what is called finesse. You are reserved with those you dislike. There is a serious and sad side to your character; you are very thoughtful and contemplative when in these moods. But you are not pessimistic. You have superior abilities, for they are intuitively intellectual. There is a cold reticence which restrains generous impulses and which inclines to acquisitiveness; it will make you deliberate, inventive, adding self-esteem, some vanity.'

"At an early age I was left much alone in the nursery and there contracted the habit of masturbation long before the age of puberty. I use the word 'masturbation' for want of a better, though it may not quite describe my case. I have never used my hand to the penis. As far back as I can remember I have had what a Frenchman has described as 'le fetichisme de la chaussure,' and in those early days, before I was 6 years old, I would put on my father's boots, taken from a cupboard at hand, and then tying or strapping my legs together would produce an erection, and all the pleasurable feelings experienced, I suppose, by means of masturbation. I always did this secretly, but couldn't tell why. I continued this practice on and off all my boyhood and youth. When I discovered the first emission I was much surprised. I always did this thing without loosening my trousers. As to how these feelings arose I am totally unable to say. I can't remember being without such feelings, and they seem to me perfectly normal. The sight, or even thought, of high boots, or leggings, especially if well polished or in patent leather, would set all my sexual passions aflame, and does yet. As a boy my great desire

was to wear these things. A soldier in boots and spurs, a groom in tops, or even an errand-boy in patent leather leggings, fascinated me, and to this day, despite reason and everything else. The sight of such things produced an erection. An emission I could always produce by tightly tying my legs together, but only when wearing boots, and preferably leggings, which when I had pocket money I bought for this purpose. (At the present moment I have five pairs in the house and two pairs of high boots, quite unjustified by ordinary use.) This habit I lapse into yet at times. The smell of leather affects me, but I never know how far this may be due to association with boots; the smell suggests the image. Restraint by a leather strap is more exciting than by cords. Erotic dreams always take the form of restraint on the limbs when booted.

"Uniforms and liveries have a great temptation for me, but only when of a tight-fitting nature and smart, as soldiers', grooms', etc., but not sailors'; most powerfully when the person is in boots or leggings and breeches.

"I was a quiet, sensitive boy, taking no part in games or sports. Have always been indifferent to them. I made few friends, but didn't want them. The craving for friendship came much later, after I was 21. I was a day boy at a private school, and never had any conversation with any boy on sexual matters, though I was dimly aware of much 'nastiness' about the school. I knew nothing of sodomy. But all these things were repulsive to me, notwithstanding my secret practices. I was a 'good boy.'

"Up to the age of 21 I was perfectly satisfied with my own society, something of a prig, fond of books and reading, etc. I was and ever have been absolutely insensible to the influence of the other sex. I am not a woman hater, and take intellectual pleasure in the society of certain ladies, but they are nearly all much older than myself. I have a strong repulsion from sexual relations with women. I should not mind being married for the sake of companionship and for the sake of having boys of my own. But the sexual act would frighten me. I could not in my present frame of mind go to bed with a woman. Yet I feel an immense envy of my married friends in that they are able to give out, and find satisfaction for, their affection in a way that is quite impossible for me. I picture certain boys in the place of the

wife.

"I am now only happy in the society of men younger than myself, age 17 to (say) 23 or 24, youths with smooth faces, or first sign of hair on lip, well groomed, slightly effeminate in feature, of sympathetic, perhaps weak nature. I feel I want to help them, do something for them, devote myself entirely to their welfare.

"With such there is no fixed line between friendship and love. I yearn for intimacy with particular friends, but never dare express it. I find so many people object to any strong expression of feeling that I dare not run the risk of appearing ridiculous in the eyes of these desired intimates.

"I have no desire for paedicatio, but the idea itself does not repulse me or seem unnatural, though personally it repels me a little. But I think this to be mere prejudice on my part, which might be broken down if the loved person showed a willingness to act a passive part. I should never dare to make an advance, however.

"I am restrained by moral and religious considerations from making my real feelings known, and I feel I should sink in my own estimation if I gave way, though my natural desire is to do so. In the face of opportunities (not I mean of paedicatio, but of expression of excessive affection, etc.), or what might be such, I always fail to speak lest I should forfeit the esteem of the other person. I have a feeling of surprise when any one I like evinces a liking for me. I feel that those I love are immeasurably my superiors, though my reason may tell me it is not so. I would grovel at their feet, do anything to win a smile from them, or to make them give me their company.

"Ordinary bodily contact with the boy I love gives me most exquisite pleasure, and I never lose an opportunity of bringing such contact about when it can be done naturally. I feel an immense desire to embrace, kiss, squeeze, etc., the person, to generally maul him, and say nice things--the kind of things a man usually says to a woman. A handshake, the mere presence of the person, makes me happy and content.

"I can say with the Albanian: 'If I find myself in the presence

of the beloved, I rest absorbed in gazing on him. Absent, I think of nought but him. If the beloved unexpectedly appears I fall into confusion. My heart beats faster. I have eyes and ears only for the beloved.'

"I feel that my capacity of affection is finer and more spiritual than that which commonly subsists between persons of different sexes. And so, while trying to fight my instincts by religion, I find my natural feeling to be part of my religion, and its highest expression. In this sense I can speak from experience in my own case, and more especially in that of my brother, that what you have said about philanthropic activity resulting from repressed homosexuality is very true indeed. I can say with one of your female cases: 'Love is to me a religion. The very nature of my affection for my friends precludes the possibility of any element entering into it which is not absolutely pure and sacred.' I am, however, madly jealous. I want entire possession, and I can't bear for a moment that any one I do not care for should know the person I love.

"I am never attracted by men older than myself. The youths who attract me may be of any class, though preferably, I think, of a class a little lower than myself. I am not quite sure of this, however, as circumstances may have contributed more than deliberate choice to bring certain youths under my notice. Those who have exercised the most powerful influence on me have been an Oxford undergraduate, a barber's assistant, and a plumber's apprentice. Though naturally fond of intellectual society, I do not ask for intellect in those I love. It goes for nothing. I always prefer their company to that of the most educated persons. This preference has alienated me to some extent from more refined and educated circles that formerly I was intimate with.

"I have been led entirely out of my old habits by association with younger friends, and now do things which before I should never have dreamed of doing. My thoughts now are always with certain youths, and if they speak of leaving the town, or in any way talk of a future that I cannot share, I suffer horrid sinkings of the heart and depression of spirits."

This case, while it concerns a person of quite different temperament, with a more innate predisposition to specific perversions, is yet in many

respects analogous to the previous case. There is boot-fetichism; nothing is felt to be so attractive as the foot-gear, and there is also at the same time more than this; there is the attraction of repression and constraint developed into a sexual symbol. In C.P.'s case that symbolism arises from the experience of an abnormal heterosexual relationship; in A.N.'s case it is founded on auto-erotic experiences associated with inversion; in both alike the entire symbolism has become diffused and generalized.

In the two cases just brought forward we have an erotic symbolism of act founded on, and closely associated with, an erotic symbolism of object. It may be instructive to bring forward another case in which no fetichistic feeling toward an object can be traced, but an erotic symbolism still clearly exists. In this case pain, even when self-inflicted, has acquired a symbolic value as a stimulus to tumescence, without any element of masochism. Such a case serves to indicate how the sexual attraction of pain is really a special case of the erotic symbolism with which we are here concerned.

A.W., aged 50, a writer and lecturer, physically and mentally energetic and enjoying good health. He is, however, very emotional and of nervous temperament, but self-controlled. Though physically well developed, the sexual organs are small. He is married to an attractive woman, to whom he is much attached, and has two healthy children.

At 10 or 12 years of age he had a frequent desire to be whipped, his parents never having struck him, and on one occasion he asked a brother to go with him to the closet to get him to whip him on the posterior; but on arrival he was too shy to make the request. He did not recognize the cause of these desires, knowing nothing of such things except from the misinformation of his school-fellows' talk. As far as he can remember, he was an entirely normal, healthy boy up to the age of about 15, when his attention was arrested by an advertisement of a quack medicine for the results of "youthful excesses."

Being a city boy, he was unfamiliar with the coupling even of animals, had never had a conscious erection and did not know of frictional excitement. Experiment, however, resulted in an orgasm, and, though believing that it was wicked or at least weak and degrading, he indulged in masturbation at intervals, usually

about six times a month, and has continued even up to the present.

He had an abnormally small opening in the prepuce, making the uncovering of the glans almost impossible. (At the age of about 37, he himself slit the prepuce by three or four cuts of a scissors at intervals of about ten days. This was followed by a marked decrease in desire, especially as he shortly afterwards learned the importance of local cleanliness.) While in college at about the age of 19 he began to have nocturnal emissions occasionally and once or twice a week when at stool. Alarmed by these, he consulted a physician, who warned him of the danger, gave him bromide and prescribed cold bathing of the parts, with a hard, cool bed. These stopped the emissions.

He never had connection with women until the age of about 25, and then only three times until his marriage at 30 years of age, being deterred partly by conscientious scruples, but more by shyness and convention, and deriving very little pleasure from these instances. Even since marriage he has derived more pleasure from sexual excitement than from coitus, and can maintain erection for as long as two hours.

He has always been accustomed to torture himself in various ingenious ways, nearly always connected with sex. He would burn his skin deeply with red hot wire in inconspicuous places. These and similar acts were generally followed by manual excitation nearly always brought to a climax.

He considers that he is attracted to refined and intellectual women. But he is without very ardent desires, having several times gone to bed with attractive women who stripped themselves naked, but without attempting any sexual intercourse with them. He became interested in the "Karezza" theory and has tried to practice it with his wife, but could never entirely control the emission.

He has hired a masseur to whip him, as children are whipped, with a heavy dog whip, which caused pleasurable excitement. During this time he had relations with his wife generally about once a week without any great ecstasy. She was cold and sexually slow, owing to conventional sex repression and to an idea that the

whole thing was "like animals" and to fear of child-bearing, usually necessitating the use of a cover or withdrawal. It was only eight years after their marriage that she desired and obtained a child. During these years he would often stick pins through his mammae and tie them together by a string round the pins drawn so short as to cause great pain and then indulge himself in the sexual act. He used strong wooden clips with a tack fixed in them, so as to pierce and pinch the mammae, and once he drove a pin entirely through the penis itself, then obtaining orgasm by friction. He was never able to get an automatic emission in this way, though he often tried, not even by walking briskly during an erection.

In another class of cases a purely ideal symbolism may be present by means of a fetich which acts as a powerful stimulus without itself being felt to possess any attraction. A good illustration of this condition is furnished by a case which has been communicated to me by a medical correspondent in New Zealand.

"The patient went out to South Africa as a trooper with the contingent from New Zealand, throwing up a good position in an office to do so. He had never had any trouble as regards connection with women before going out to South Africa. While in active service at the front he sustained a nasty fall from his horse, breaking his leg. He was unconscious for four days, and was then invalided down to Cape Town. Here he rapidly got well, and his accustomed health returning to him he started having what he terms 'a good time.' He repeatedly went to brothels, but was unable to have more than a temporary erection, and no ejaculation would take place. In one of these places he was in company with a drunken trooper, who suggested that they should perform the sexual act with their boots and spurs (only) on. My patient, who was also drunk, readily assented, and to his surprise was enabled to perform the act of copulation without any difficulty at all. He has repeatedly tried since to perform the act without any spurs, but is quite unable to do so; with the spurs he has no difficulty at all in obtaining all the gratification he desires. His general health is good. His mother was an extremely nervous woman, and so is his sister. His father died when he was quite young. His only other relation in the colony is a married sister, who seems to enjoy vigorous health."

The consideration of the cases here brought forward may suffice to show that beyond those fetichisms which find their satisfaction in the contemplation of a part of the body or a garment, there is a more subtle symbolism. The foot is a center of force, an agent for exerting pressure, and thus it furnishes a point of departure not alone for the merely static sexual fetich, but for a dynamic erotic symbolization. The energy of its movements becomes a substitute for the energy of the sexual organs themselves in coitus, and exerts the same kind of fascination. The young girl (page 35) "who seemed to have a passion for treading upon things which would scrunch or yield under her foot," already possessed the germs of an erotic symbolism which, under the influence of circumstances in which she herself took an active part, developed into an adequate method of sexual gratification.[23] The youth who was her partner learned, in the same way, to find an erotic symbolism in all the pressure reactions of attractive feminine feet, the swaying of a carriage beneath their weight, the crushing of the flowers on which they tread, the slow rising of the grass which they have pressed. Here we have a symbolism which is altogether different from that fetichism which adores a definite object; it is a dynamic symbolism finding its gratification in the spectacle of movements which ideally recall the fundamental rhythm and pressure reactions of the sexual process.

We may trace a very similar erotic symbolism in an absolutely normal form. The fascination of clothes in the lover's eyes is no doubt a complex phenomenon, but in part it rests on the aptitudes of a woman's garments to express vaguely a dynamic symbolism which must always remain indefinite and elusive, and on that account always possess fascination. No one has so acutely described this symbolism as Herrick, often an admirable psychologist in matters of sexual attractiveness. Especially instructive in this respect are his poems, "Delight in Disorder," "Upon Julia's Clothes," and notably "Julia's Petticoat." "A sweet disorder in the dress," he tells us, "kindles in clothes a wantonness;" it is not on the garment itself, but on the character of its movement that he insists; on the "erring lace," the "winning wave" of the "tempestuous petticoat;" he speaks of the "liquefaction" of clothes, their "brave vibration each way free," and of Julia's petticoat he remarks with a more specific symbolism still,

"Sometimes 'twould pant and sigh and heave,
As if to stir it scarce had leave;
But having got it, thereupon,
'Twould make a brave expansion."

In the play of the beloved woman's garment, he sees the whole process of the central act of sex, with its repressions and expansions, and at the sight is himself ready to "fall into a swoon."

FOOTNOTES:

[13] G. Stanley Hall, *_Adolescence_*, vol. ii, p. 113. It will be noted that the hand does not appear among the parts of the body which are normally of supreme interest. An interest in the hand is by no means uncommon (it may be noted, for instance, in the course of History XII in Appendix B to vol. iii of these *_Studies_*), but the hand does not possess the mystery which envelops the foot, and hand-fetichism is very much less frequent than foot-fetichism, while glove-fetichism is remarkably rare. An interesting case of hand-fetichism, scarcely reaching morbid intensity, is recorded by Binet, *_Etudes de Psychologie Experimentale_*, pp. 13-19; and see Krafft-Ebing, *_Op. cit._*, pp. 214 et seq.

[14] *_Memoires_*, vol. i, Chapter VII.

[15] Among leading English novelists Hardy shows an unusual but by no means predominant interest in the feet and shoes of his heroines; see, e.g., the observations of the cobbler in *_Under the Greenwood Tree_*, Chapter III. A chapter in Goethe's *_Wahlverwandtschaften_* (Part I, Chapter II) contains an episode involving the charm of the foot and the kissing of the beloved's shoe.

[16] Schinz, "Philosophie des Conventions Sociales," *_Revue Philosophique_*, June, 1903, p. 626. Mirabeau mentions in his *_Erotika Biblion_* that modern Greek women sometimes use their feet to provoke orgasm in their lovers. I may add that simultaneous mutual masturbation by means of the feet is not unknown to-day, and I have been told by an English shoe-fetichist that he at one time was accustomed to practice this with a married lady (Brazilian)--she with slippers on and he without--who derived gratification equal to his own.

[17] Jacoby (loc. cit. pp. 796-7) gives a large number of references to Ovid's works bearing on this point. "In reading him," he remarks, "one is inclined to say that the psychology of the Romans was closely allied to that of the Chinese."

[18] R. Kleinpaul, *„Sprache ohne Worte“*, p. 308. See also Moll, *„Kontraere Sexualempfindung“*, third edition, pp. 306-308. Bloch brings together many interesting references bearing on the ancient sexual and religious symbolism of the shoe, *„Beitraege zur AEtologie der Psychopathia Sexualis“*, Teil II, p. 324.

[19] Jacoby (loc. cit. p. 797) appears to regard shoe-fetichism as a true atavism: "The sexual adoration of feminine foot-gear," he concludes, "perhaps the most enigmatic and certainly the most singular of degenerative insanities, is thus merely a form of atavism, the return of the degenerate to the very ancient and primitive psychology which we no longer understand and are no longer capable of feeling."

[20] Moll has reported in detail (*„Untersuchungen ueber die Libido Sexualis“*, bd. i, Teil II, pp. 320-324) a case which both he and Krafft-Ebing regard as illustrative of the connection between boot-fetichism and masochism. It is essentially a case of masochism, though manifesting itself almost exclusively in the desire to perform humiliating acts in connection with the attractive person's boots.

[21] Krafft-Ebing goes so far as to assert (*„Psychopathia Sexualis“*, English translation of tenth edition, p. 174) that "when in cases of shoe-fetichism the female shoe appears alone as the excitant of sexual desire one is justified in presuming that masochistic motives have remained latent.... Latent masochism may always be assumed as the unconscious motive." In this way he hopelessly misinterprets some of his own cases.

[22] Krafft-Ebing goes so far as to assert (*„Psychopathia Sexualis“*, English translation, pp. 159 and 174). Yet some of the cases he brings forward (e.g., Coxe's as quoted by Hammond) show no sign of masochism, since, according to Krafft-Ebing's own definition (p. 116), the idea of subjugation by the opposite sex is of the essence of masochism.

[23] Her actions suggest that there is often a latent sexual consciousness in regard to the feet in women, atavistic or pseudo-atavistic, and corresponding to the sexual attraction which the feet formerly aroused, almost normally, in men. This is also suggested by the case, referred to by Shufeldt, of an unmarried woman, belonging to a family exhibiting in a high degree both erotic and neurotic traits, who had "a certain uncontrollable fascination for shoes. She delights in new shoes, and changes her shoes all day long at regular intervals of three hours each.

She keeps this row of shoes out in plain sight in her apartment." (R.W. Shufeldt, "On a Case of Female Impotency," 1896, p. 10.)

III.

Scatalogic Symbolism--Urolagnia--Coprolagnia--The Ascetic Attitude Towards the Flesh--Normal basis of Scatalogic Symbolism--Scatalogic Conceptions Among Primitive Peoples--Urine as a Primitive Holy Water--Sacredness of Animal Excreta--Scatology in Folk-lore--The Obscene as Derived from the Mythological--The Immature Sexual Impulse Tends to Manifest Itself in Scatalogic Forms--The basis of Physiological Connection Between the Urinary and Genital Spheres--Urinary Fetichism Sometimes Normal in Animals--The Urolagnia of Masochists--The Scatology of Saints--Urolagnia More Often a Symbolism of Act Than a Symbolism of Object--Only Occasionally an Olfactory Fetichism--Comparative Rarity of Coprolagnia--Influence of Nates Fetichism as a Transition to Coprolagnia--Ideal Coprolagnia--Olfactory Coprolagnia--Urolagnia and Coprolagnia as Symbols of Coitus.

We meet with another group of erotic symbolisms--alike symbolisms of object and of act--in connection with the two functions adjoining the anatomical sexual focus: the urinary and alvine excretory functions. These are sometimes termed the scatalogical group, with the two subdivisions of urolagnia and Coprolagnia.[24] *_Inter faeces et urinam nascimur_* is an ancient text which has served the ascetic preachers of old for many discourses on the littleness of man and the meanness of that reproductive power which plays so large a part in man's life. "The stupid bungle of Nature," a correspondent writes, "whereby the generative organs serve as a means of relieving the bladder, is doubtless responsible for much of the disgust which those organs excite in some minds."

At the same time, it is necessary to point out, such reflex influence may act not in one direction only, but also in the reverse direction. From the standpoint of ascetic contemplation eager to belittle humanity, the excretory centers may cast dishonor upon the genital center which they adjoin. From the more ecstatic standpoint of the impassioned lover, eager to magnify the charm of the woman he worships, it is not impossible for the excretory centers to take on some charm from the irradiating center of

sex which they enclose.

Even normally such a process is traceable. The normal lover may not idealize the excretory functions of his mistress, but the fact that he finds no repulsion in the most intimate contacts and feels no disgust at the proximity of the excretory orifices or the existence of their functions, indicates that the idealization of love has exerted at all events a neutralizing influence; indeed, the presence of an acute sensibility to the disturbing influence of this proximity of the excretory orifices and their functions must be considered abnormal; Swift's "Strephon and Chloe"--with the conviction underlying it that it is an easy matter for the excretory functions to drown the possibilities of love--could only have proceeded from a morbidly sensitive brain.[25]

A more than mere neutralizing influence, a positively idealizing influence of the sexual focus on the excretory processes adjoining it, may take place in the lover's mind without the normal variations of sexual attraction being over-passed, and even without the creation of an excretory fetichism.

Reflections of this attitude may be found in the poets. In the Song of Songs the lover says of his mistress, "Thy navel is like a round goblet, wherein no mingled wine is wanting;" in his lyric "To Dianeme," Herrick says with clear reference to the *mons veneris*:--

"Show me that hill where smiling love doth sit,
Having a living fountain under it;"

and in the very numerous poems in various languages which have more or less obscurely dealt with the rose as the emblem of the feminine pudenda there are occasional references to the stream which guards or presides over the rose. It may, indeed, be recalled that even in the name nymphae anatomists commonly apply to the labia minora there is generally believed to be a poetic allusion to the Nymphs who presided over streams, since the labia minora exert an influence on the direction of the urinary stream.

In Wilhelm Meister (Part I, Chapter XV), Goethe, on the basis of his own personal experiences, describes his hero's emotions in the humble surroundings of Marianne's little room as compared

with the stateliness and order of his own home. "It seemed to him when he had here to remove her stays in order to reach the harpsichord, there to lay her skirt on the bed before he could seat himself, when she herself with unembarrassed frankness would make no attempt to conceal from him many natural acts which people are accustomed to hide from others out of decency--it seemed to him, I say, that he became bound to her by invisible bands." We are told of Wordsworth (Findlay's *_Recollections of De Quincey_*, p. 36) that he read *_Wilhelm Meister_* till "he came to the scene where the hero, in his mistress's bedroom, becomes sentimental over her dirty towels, etc., which struck him with such disgust that he flung the book out of his hand, would never look at it again, and declared that surely no English lady would ever read such a work." I have, however, heard a woman of high intellectual distinction refer to the peculiar truth and beauty of this very passage.

In one of his latest novels, *_Les Rencontres de M. de Breot_*, Henri de Regnier, one of the most notable of recent French novelists, narrates an episode bearing on the matter before us. A personage of the story is sitting for a moment in a dark grotto during a night fete in a nobleman's park, when two ladies enter and laughingly proceed to raise their garments and accomplish a natural necessity. The man in the background, suddenly overcome by a sexual impulse, starts forward; one lady runs away, the other, whom he detains, offers little resistance to his advances. To M. de Breot, whom he shortly after encounters, he exclaims, abashed at his own actions: "Why did I not flee? But could I imagine that the spectacle of so disgusting a function would have any other effect than to give me a humble opinion of human nature?" M. de Breot, however, in proceeding to reproach his interlocutor for his inconsiderate temerity, observes: "What you tell me, sir, does not entirely surprise me. Nature has placed very various instincts within us, and the impulse that led you to what you have just now done is not so peculiar as you think. One may be a very estimable man and yet love women even in what is lowliest in their bodies." In harmony with this passage from Regnier's novel are the remarks of a correspondent who writes to me of the function of urination that it "appeals sexually to most normal individuals. My own observations and inquiries prove this. Women themselves instinctively feel it. The secrecy surrounding the matter lends, too, I think, a sexual interest."

The fact that scatologic processes may in some degree exert an attraction even in normal love has been especially emphasized by Bloch (*Beitraege zur Aetiologie der Psychopathia Sexualis*, Teil II, pp. 222, et seq.): "The man whose intellect and aesthetic sense has been 'clouded by the sexual impulse' sees these things in an entirely different light from him who has not been overcome by the intoxication of love. For him they are idealized (*sit venia verbo*) since they are a part of the beloved person, and in consequence associated with love." Bloch quotes the *Memoiren einer Saengerin* (a book which is said to be, though this seems doubtful, genuinely autobiographical) in the same sense: "A man who falls in love with a girl is not dragged out of his poetic sphere by the thought that his beloved must relieve certain natural necessities every day. It seems, indeed, to him to be just the opposite. If one loves a person one finds nothing obscene or disgusting in the object that pleases me." The opposite attitude is probably in extreme cases due to the influence of a neurotic or morbidly sensitive temperament. Swift possessed such a temperament. The possession of a similar temperament is doubtless responsible for the little prose poem, "L'Extase," in which Huysmans in his first book, *Le Drageloir a Epices*, has written an attenuated version of "Strephon and Chloe" to express the disillusionment of love; the lover lies in a wood clasping the hand of the beloved with rapturous emotion; "suddenly she rose, disengaged her hand, disappeared in the bushes, and I heard as it were the rustling of rain on the leaves." His dream has fled.

In estimating the significance of the lover's attitude in this matter, it is important to realize the position which scatologic conceptions took in primitive belief. At certain stages of early culture, when all the emanations of the body are liable to possess mysterious magic properties and become apt for sacred uses, the excretions, and especially the urine, are found to form part of religious ritual and ceremonial function. Even among savages the excreta are frequently regarded as disgusting, but under the influence of these conceptions such disgust is inhibited, and those emanations of the body which are usually least honored become religious symbols.

Urine has been regarded as the original holy water, and many customs which still survive in Italy and various parts of Europe,

involving the use of a fluid which must often be yellow and sometimes salt, possibly indicate the earlier use of urine. (The Greek water of aspersion, according to Theocritus, was mixed with salt, as is sometimes the modern Italian holy water. J.J. Blunt, *_Vestiges of Ancient Manners and Customs_*, p. 173.) Among the Hottentots, as Kolbein and others have recorded, the medicine man urinated alternately on bride and bridegroom, and a successful young warrior was sprinkled in the same way. Mungo Park mentions that in Africa on one occasion a bride sent a bowl of her urine which was thrown over him as a special mark of honor to a distinguished guest. Pennant remarked that the Highlanders sprinkled their cattle with urine, as a kind of holy water, on the first Monday in every quarter. (Bourke, *_Scatalogic Rites_*, pp. 228, 239; Brand, *_Popular Antiquities_*, "Bride-Ales.")

Even the excreta of animals have sometimes been counted sacred. This is notably so in the case of the cow, of all animals the most venerated by primitive peoples, and especially in India. Jules Bois (*_Visions de l'Inde_*, p. 86) describes the spectacle presented in the temple of the cows at Benares: "I put my head into the opening of the holy stables. It was the largest of temples, a splendor of precious stones and marble, where the venerated heifers passed backwards and forwards. A whole people adored them. They take no notice, plunged in their divine and obscure unconsciousness. And they fulfil with serenity their animal functions; they chew the offerings, drink water from copper vessels, and when they are filled they relieve themselves. Then a stercoraceous and religious insanity overcomes these starry-faced women and venerable men; they fall on their knees, prostrate themselves, eat the droppings, greedily drink the liquid, which for them is miraculous and sacred." (Cf. Bourke, *_Scatalogic Rites_*, Chapter XVII.)

Among the Chevsurs of the Caucasus, perhaps an Iranian people, a woman after her confinement, for which she lives apart, purifies herself by washing in the urine of a cow and then returns home. This mode of purification is recommended in the Avesta, and is said to be used by the few remaining followers of this creed.

We have not only to take into account the frequency with which among primitive peoples the excretions possess a religious significance. It is further to be noted that in the folk-lore of modern Europe we everywhere

find plentiful evidence of the earlier prevalence of legends and practices of a scatological character. It is significant that in the majority of cases it is easy to see a sexual reference in these stories and customs. The legends have lost their earlier and often mythical significance, and frequently take on a suggestion of obscenity, while the scatological practices have become the magical devices of lovelorn maidens or forsaken wives practiced in secrecy. It has happened to scatological rites to be regarded as we may gather from the *_Clouds_* of Aristophanes, that the sacred leathern phallus borne by the women in the Bacchanalia was becoming in his time, an object to arouse the amusement of little boys.

Among many primitive peoples throughout the world, and among the lower social classes of civilized peoples, urine possesses magic properties, more especially, it would seem, the urine of women and that of people who stand, or wish to stand, in sexual relationship to each other. In a legend of the Indians of the northwest coast of America, recorded by Boas, a woman gives her lover some of her urine and says: "You can wake the dead if you drop some of my urine in their ears and nose." (*_Zeitschrift fuer Ethnologie_*, 1894, Heft IV, p. 293.) Among the same Indians there is a legend of a woman with a beautiful white skin who found on bathing every morning in the river that the fish were attracted to her skin and could not be driven off even by magical solutions. At last she said to herself: "I will make water on them and then they will leave me alone." She did so, and henceforth the fish left her. But shortly after fire came from Heaven and killed her. (Ib., 1891, Heft V, p. 640.) Among both Christians and Mohammedans a wife can attach an unfaithful husband by privately putting some of her urine in his drink. (B. Stern, *_Medizin in der Tuerkei_*, vol. ii, p. 11.) This practice is world-wide; thus among the aborigines of Brazil, according to Martius, the urine and other excretions and secretions are potent for aphrodisiacal objects. (Bourke's *_Scatologic Rites of All Nations_* contains many references to the folk-lore practices in this matter; a study of popular beliefs in the magic power of urine, published in Bombay by Professor Eugen Wilhelm in 1889, I have not seen.)

The legends which narrate scatologic exploits are numerous in the literature of all countries. Among primitive peoples they often have a purely theological character, for in the popular mythologies of all countries (even, as we learn from

Aristophanes, among the Greeks) natural phenomena such as the rain, are apt to be regarded as divine excretions, but in course of time the legends take on a more erotic or a more obscene character. In the Irish Book of Leinster (written down somewhere about the twelfth century, but containing material of very much older date) we are told how a number of princesses in Emain Macha, the seat of the Ulster Kings, resolved to find out which of them could by urinating on it melt a snow pillar which the men had made, the woman who succeeded to be regarded as the best among them. None of them succeeded, and they sent for Derbforgaill, who was in love with Cuchullain, and she was able to melt the pillar; whereupon the other women, jealous of the superiority she had thus shown, tore out her eyes. (Zimmer, "Keltische Beiträage," Zeitschrift fuer Deutsche Alterthum, vol. xxxii, Heft II, pp. 216-219.) Rhys considers that Derbforgaill was really a goddess of dawn and dusk, "the drop glistening in the sun's rays," as indicated by her name, which means a drop or tear. (J. Rhys, Lectures on the Origin and Growth of Religion as Illustrated by Celtic Heathendom, p. 466.) It is interesting to compare the legend of Derbforgaill with a somewhat more modern Picardy folk-lore conte which is clearly analogous but no longer seems to show any mythologic element, "La Princesse qui pisse par dessus les Meules." This princess had a habit of urinating over hay-cocks; the king, her father, in order to break her of the habit, offered her in marriage to anyone who could make a hay-cock so high that she could not urinate over it. The young men came, but the princess would merely laugh and at once achieve the task. At last there came a young man who argued with himself that she would not be able to perform this feat after she had lost her virginity. He therefore seduced her first and she then failed ignobly, merely wetting her stockings. Accordingly, she became his bride. (Kryptadia, vol. i. p. 333.) Such legends, which have lost any mythologic elements they may originally have possessed and have become merely contes, are not uncommon in the folk-lore of many countries. But in their earlier more religious forms and in their later more obscene forms, they alike bear witness to the large place which scatologic conceptions play in the primitive mind.

It is a notable fact in evidence of the close and seemingly normal association with the sexual impulse of the scatologic processes, that an interest in them, arising naturally and spontaneously, is one of the most

frequent channels by which the sexual impulse first manifests itself in young boys and girls.

Stanley Hall, who has made special inquiries into the matter, remarks that in childhood the products of excretion by bladder and bowels are often objects of interest hardly less intense for a time than eating and drinking. ("Early Sense of Self," American Journal of Psychology, April, 1898, p. 361.) "Micturitional obscenities," the same writer observes again, "which our returns show to be so common before adolescence, culminate at 10 or 12, and seem to retreat into the background as sex phenomena appear." They are, he remarks, of two classes: "Fouling persons or things, secretly from adults, but openly with each other," and less often "ceremonial acts connected with the act or the product that almost suggest the scatological rites of savages, unfit for description here, but of great interest and importance." (G. Stanley Hall, Adolescence, vol. i, p. 116.) The nature of such scatological phenomena in childhood--which are often clearly the instinctive manifestations of an erotic symbolism--and their wide prevalence among both boys and girls, are very well illustrated in a narrative which I include in Appendix B, History II.

In boys as they approach the age of puberty, this attraction to the scatologic, when it exists, tends to die out, giving place to more normal sexual conceptions, or at all events it takes a subordinate and less serious place in the mind. In girls, on the other hand, it often tends to persist. Edmond de Goncourt, a minute observer of the feminine mind, refers in Cherie to "those innocent and triumphant gaieties which scatologic stories have the privilege of arousing in women who have remained still children, even the most distinguished women." The extent to which innocent young women, who would frequently be uninterested or repelled in presence of the sexually obscene are sometimes attracted by the scatologically obscene, becomes intelligible, however, if we realize that a symbolism comes here into play. In women the more specifically sexual knowledge and experience of life frequently develop much later than in men or even remains in abeyance, and the specifically sexual phenomena cannot therefore easily lend themselves to wit, or humor, or imagination. But the scatologic sphere, by the very fact that in women it is a specially intimate and secret region which is yet always liable to be unexpectedly protruded into consciousness, furnishes an inexhaustible field for situations which have the same character as those furnished by

the sexually obscene. It thus happens that the sexually obscene which in men tends to overshadow the scatologically obscene, in women--partly from inexperience and partly, it is probable, from their almost physiological modesty--plays a part subordinate to the scatological. In a somewhat analogous way scatological wit and humor play a considerable part in the work of various eminent authors who were clergymen or priests.

In addition to the anatomical and psychological associations which contribute to furnish a basis on which erotic symbolisms may spring up, there are also physiological connections between the genital and urinary spheres which directly favor such symbolisms. In discussing the analysis of the sexual impulse in a previous volume of these *_Studies_*, I have pointed out the remarkable relationship--sometimes of transference, sometimes of compensation--which exists between genital tension and vesical tension, both in men and women. In the histories of normal sexual development brought together at the end of that and subsequent volumes the relationship may frequently be traced, as also in the case of C.P. in the present study (p. 37). Vesical power is also commonly believed to be in relation with sexual potency, and the inability to project the urinary stream in a normal manner is one of the accepted signs of sexual impotency.[26] Fere, again, has recorded the history of a man with periodic crises of sexual desire, and subsequently sexual obsession without desire, which were always accompanied by the impulse to urinate and by increased urination.[27] In the case, recorded by Pitres and Regis, of a young girl who, having once at the sight of a young man she liked in a theater been overcome by sexual feeling accompanied by a strong desire to urinate, was afterward tormented by a groundless fear of experiencing an irresistible desire to urinate at inconvenient times,[28] we have an example of what may be called a physiological scatologic symbolism of sex, an emotion which was primarily erotic becoming transferred to the bladder and then remaining persistent. From such a physiological symbolism it is but a step to the psychological symbolisms of scatologic fetichism.

It is worthy of note, as an indication that such phenomena are scarcely abnormal, that a urinary symbolism, and even a strictly sexual fetichism, are normal among many animals.

The most familiar example of this kind is furnished by the dog, who is sexually excited in this manner by traces of the bitch and himself takes every opportunity of making his own path recognizable. "This custom," Espinas remarks (*_Des Societes Animales_*, p. 228), "has no other aim than to spread along the

road recognizable traces of their presence for the benefit of individuals of the other sex, the odor of these traces doubtless causing excitement."

It is noteworthy, also, that in animals as well as in man, sexual excitement may manifest itself in the bladder. Thus Daumas states (*Chevaux de Sahara*, p. 49) that if the mare urinates when she hears the stallion neigh it is a sign that she is ready for connection.

It is in masochism, or passive algolagnia, that we may most frequently find scatologic symbolism in its fully developed form. The man whose predominant impulse is to subjugate himself to his mistress and to receive at her hands the utmost humiliation, frequently finds the climax of his gratification in being urinated on by her, whether in actual fact or only in imagination.

In many such cases, however, it is evident that we have a mixed phenomenon; the symbolism is double. The act becomes desirable because it is the outward and visible sign of an inwardly experienced abject slavery to an adored person. But it is also desirable because of intimately sexual associations in the act itself, as a symbolical detumescence, a simulacrum of the sexual act, and one which proceeds from the sexual focus itself.

Krafft-Ebing records various cases of masochism in which the emission of urine on to the body or into the mouth formed the climax of sexual gratification, as, for instance (*Psychopathia Sexualis*, English translation, p. 183) in the case of a Russian official who as a boy had fancies of being bound between the thighs of a woman, compelled to sleep beneath her nates and to drink her urine, and in later life experienced the greatest excitement when practicing the last part of this early imagination.

In another case, recorded by Krafft-Ebing and by him termed "ideal masochism" (*Op. cit.*, pp. 127-130), the subject from childhood indulged in voluptuous day-dreams in which he was the slave of a beautiful mistress who would compel him to obey all her caprices, stand over him with one foot on his breast, sit on his face and body, make him wait on her in her bath, or when she urinated, and sometimes insist on doing this on his face; though a highly intellectual man, he was always too timid to attempt to

carry any of his ideas into execution; he had been troubled by nocturnal enuresis up to the age of 20.

Neri, again (*_Archivio delle Psicopatie Sessuali_*, vol. i, fasc. 7 and 8, 1896), records the case of an Italian masochist who experienced the greatest pleasure when both urination and defecation were practiced in this manner by the woman he was attached to.

In a previous volume of these *_Studies_* ("Sexual Inversion," History XXVI) I have recorded the masochistic day-dreams of a boy whose impulses were at the same time inverted; in his reveries "the central fact," he states, "became the discharge of urine from my lover over my body and limbs, or, if I were very fond of him, I let it be in my face." In actual life the act of urination casually witnessed in childhood became the symbol, even the reality, of the central secret of sex: "I stood rooted and flushing with downcast eyes till the act was over, and was conscious for a considerable time of stammering speech and bewildered faculties.... I was overwhelmed with emotion and could barely drag my feet from the spot or my eyes from the damp herbage where he had deposited the waters of secrecy. Even to-day I cannot dissociate myself from the shuddering charm that moment had for me."

It is not only the urine and the faeces which may thus acquire a symbolic fascination and attractiveness under the influence of masochistic deviations of sexual idealization. In some cases extreme rapture has been experienced in licking sweating feet. There is, indeed, no excretion or product of the body which has not been a source of ecstasy: the sweat from every part of the body, the saliva and menstrual fluid, even the wax from the ears.

Krafft-Ebing very truly points out (*_Psychopathia Sexualis_*, English translation, p. 178) that this sexual scatologic symbolism is precisely paralleled by a religious scatologic symbolism. In the excesses of devout enthusiasm the ascetic performs exactly the same acts as are performed in these excesses of erotic enthusiasm. To mix excreta with the food, to lick up excrement, to suck festering sores--all these and the like are acts which holy and venerated women have performed.

Not only the saint, but also the prophet and medicine-man have been frequently eaters of human excrement; it is only necessary to refer to the instance of the prophet Ezekiel, who declared that he was commanded to bake his bread with human dung, and to the practices of medicine-men at Torres Straits, in whose training the eating of human excrement takes a recognized part. (Deities, notably Baal-Phegor, were sometimes supposed to eat excrement, so that it was natural that their messengers and representatives among men should do so. As regards Baal-Phegor, see Dulaure, *_Des Divinites Generatrices_*, Chapter IV, and J.G. Bourke, *_Scatalogic Rites of All Nations_*, p. 241. See also Ezekiel, Chapter IV, v. 12, and *_Reports Anthropological Expedition to Torres Straits_*, vol. v, p. 321.)

It must be added, however, that while the masochist is overcome by sexual rapture, so that he sees nothing disgusting in his act, the medicine-man and the ascetic are not so invariably overcome by religious rapture, and several ascetic writers have referred to the horror and disgust they experienced, at all events at first, in accomplishing such acts, while the medicine-men when novices sometimes find the ordeal too severe and have to abandon their career. Brenier de Montmorand, while remarking, not without some exaggeration, that "the Christian ascetics are almost all eaters of excrement" ("*Ascetisme et Mysticisme*," *_Revue Philosophique_*, March, 1904, p. 245), quotes the testimonies of Marguerite-Marie and Madame Guyon as to the extreme repugnance which they had to overcome. They were impelled by a merely intellectual symbolism of self-mortification rather than by the profoundly felt emotional symbolism which moves the masochist.

Coprophagic acts, whether under the influences of religious exaltation or of sexual rapture, inevitably excite our disgust. We regard them as almost insane, fortified in that belief by the undoubted fact that coprophagia is not uncommon among the insane. It may, therefore, be proper to point out that it is not so very long since the ingestion of human excrement was carried out by our own forefathers in the most sane and deliberate manner. It was administered by medical practitioners for a great number of ailments, apparently with entirely satisfactory results. Less than two centuries ago, Schurig, who so admirably gathered together and arranged the medical lore of his own and the immediately preceding ages, wrote a very long and detailed

chapter, "De Stercoris Humani Usu Medico" (_Chylologia_, 1725, cap. XIII; in the Paris _Journal de Medecine_ for February 19, 1905, there appeared an article, which I have not seen, entitled "Medicaments oubliees: l'urine et la fiente humaine.") The classes of cases in which the drug was found beneficial would seem to have been extremely various. It must not be supposed that it was usually ingested in the crude form. A common method was to take the faeces of boys, dry them, mix them with the best honey, and administer an electuary. (At an earlier period such drugs appear to have met with some opposition from the Church, which seems to have seen in them only an application of magic; thus I note that in Burchard's remarkable Penitential of the fourteenth century, as reproduced by Wasserschleben, 40 days' penance is prescribed for the use of human urine or excrement as a medicine. Wasserschleben _Die Bussordnungen der Abendländlichen Kirche_, p. 651.)

The urolagnia of masochism is not a simple phenomenon; it embodies a double symbolism: on the one hand a symbolism of self-abnegation, such as the ascetic feels, on the other hand a symbolism of transferred sexual emotion. Krafft-Ebing was disposed to regard all cases in which a scatological sexual attraction existed as due to "latent masochism." Such a point of view is quite untenable. Certainly the connection is common, but in the majority of cases of slightly marked scatological fetichism no masochism is evident. And when we bear in mind the various considerations, already brought forward, which show how widespread and clearly realized is the natural and normal basis furnished for such symbolism, it becomes quite unnecessary to invoke any aid from masochism. There is ample evidence to show that, either as a habitual or more usually an occasional act, the impulse to bestow a symbolic value on the act of urination in a beloved person, is not extremely uncommon; it has been noted of men of high intellectual distinction; it occurs in women as well as men; when existing in only a slight degree, it must be regarded as within the normal limits of variation of sexual emotion.

The occasional cases in which the urine is drunk may possibly suggest that the motive lies in the properties of the fluid acting on the system. Support for this supposition might be found in the fact that urine actually does possess, apart altogether from its magic virtues embodied in folk-lore, the properties of a general stimulant. In composition (as Masterman first pointed out) "beef-tea differs little from healthy urine," containing

exactly the same constituents, except that in beef-tea there is less urea and uric acid. Fresh urine--more especially that of children and young women--is taken as a medicine in nearly all parts of the world for various disorders, such as epistaxis, malaria and hysteria, with benefit, this benefit being almost certainly due to its qualities as a general stimulant and restorative. William Salmon's *_Dispensatory_*, 1678 (quoted in *_British Medical Journal_*, April 21, 1900, p. 974), shows that in the seventeenth century urine still occupied an important place as a medicine, and it frequently entered largely into the composition of Aqua Divina.

Its use has been known even in England in the nineteenth century. (Masterman, *_Lancet_*, October 2, 1880; R. Neale, "Urine as a Medicine," *_Practitioner_*, November, 1881; Bourke brings together a great deal of evidence as to the therapeutic uses of urine in his *_Scatalogic Rites_*, especially pp. 331-335; Lusini has shown that normal urine invariably increases the frequency of the heart beats, *_Archivio di Farmacologia_*, fascs. 19-21, 1893.)

But it is an error to suppose that these facts account for the urolagnic drinking of urine. As in the gratification of a normal sexual impulse, the intense excitement of gratifying a scatologic sexual impulse itself produces a degree of emotional stimulation far greater than the ingestion of a small amount of animal extractives would be adequate to effect. In such cases, as much as in normal sexuality, the stimulation is clearly psychic.

When, as is most commonly the case, it is the process of urination and not the urine itself which is attractive, we are clearly concerned with a symbolism of act and not with the fetichistic attraction of an excretion. When the excretion, apart from the act, provides the attraction, we seem usually to be in the presence of an olfactory fetichism. These fetichisms connected with the excreta appear to be experienced chiefly by individuals who are somewhat weak-minded, which is not necessarily the case in regard to those persons for whom the act, rather than its product apart from the beloved person, is the attractive symbol.

The sexually symbolic nature of the act of urination for many people is indicated by the existence, according to Bloch, who enumerates various kinds of indecent photographs, of a group which he terms "the notorious *_pisseuses_*." It is further

indicated by several of the reproductions in Fuch's _Erotsiche Element in der Karikatur_, such as Delorme's "La Necessite n'a point de Loi." (It should be added that such a scene by no means necessarily possesses any erotic symbolism, as we may see in Rembrandt's etching commonly called "Le Femme qui Pisse," in which the reflected lights on the partly shadowed stream furnish an artistic motive which is obviously free from any trace of obscenity.) In the case which Krafft-Ebing quotes from Maschka of a young man who would induce young girls to dance naked in his room, to leap, and to urinate in his presence, whereupon seminal ejaculation would take place, we have a typical example of urolagnic symbolism in a form adequate to produce complete gratification. A case in which the urolagnic form of scatologic symbolism reached its fullest development as a sexual perversion has been described in Russia by Sukhanoff (summarized in _Archives d'Anthropologie Criminelle_, November, 1900, and _Annales Medico-psychologiques_, February, 1901), that of a young man of 27, of neuropathic temperament, who when he once chanced to witness a woman urinating experienced voluptuous sensations. From that moment he sought close contact with women urinating, the maximum of gratification being reached when he could place himself in such a position that a woman, in all innocence, would urinate into his mouth. All his amorous adventures were concerned with the search for opportunities for procuring this difficult gratification. Closets in which he was able to hide, winter weather and dull days he found most favorable to success. (A somewhat similar case is recorded in the _Archives de Neurologie_, 1902, p. 462.)

In the case of a robust man of neuropathic heredity recorded by Pelanda some light is shed on the psychic attitude in these manifestations; there was masturbation up to the age of 16, when he abandoned the practice, and up to the age of 30 found complete satisfaction in drinking the still hot urine of women. When a lady or girl in the house went to her room to satisfy a need of this kind, she had hardly left it but he hastened in, overcome by extreme excitement, culminating in spontaneous ejaculation. The younger the woman the greater the transport he experienced. It is noteworthy that in this, as possibly in all similar cases, there was no sensory perversion and no morbid attraction of taste or smell; he stated that the action of his senses was suspended by his excitement, and that he was quite unable to perceive the odor

or taste of the fluid. (Pelanda, "Pornopatice," *_Archivio di Psichiatria_,* fasc. iii-iv, 1889, p. 356.) It is in the emotional symbolism that the fascination lies and not in any sensory perversion.

Magnan records the spontaneous development of this sexual symbolism in a girl of 11, of good intellectual development but alcoholic heredity, who seduced a boy younger than herself to mutual masturbation, and on one occasion, lying on the ground and raising her clothes, asked him to urinate on her. (*_International Congress of Criminal Anthropology_,* 1889.) This case (except for the early age of the subject) illustrates sporadically occurring urolagnic symbolism in a woman, to whom such symbolism is fairly obvious on account of the close resemblance between the emission of urine and the ejaculation of semen in the man, and the fact that the same conduit serves for both fluids. (A urolagnic day-dream of this kind is recorded in the history of a lady contained in the third volume of these *_Studies_,* Appendix B, History VIII.) The natural and inevitable character of this symbolism is shown by the fact that among primitive peoples urine is sometimes supposed to possess the fertilizing virtues of semen. J.G. Frazer in his edition of Pausanias (vol. iv, p. 139) brings together various stories of women impregnated by urine. Hartland also (*_Legend of Perseus_,* vol. i, pp. 76, 92) records legends of women who were impregnated by accidentally or intentionally drinking urine.

The symbolic sexual significance of urolagnia has hitherto usually been confused with the fetichistic and mainly olfactory perversion by which the excretion itself becomes a source of sexual excitement. Long since Tardieu referred, under the name of "renifleurs," to persons who were said to haunt the neighborhood of quiet passages, more especially in the neighborhood of theatres, and who when they perceived a woman emerge after urination, would hasten to excite themselves by the odor of the excretion. Possibly a fetichism of this kind existed in a case recorded by Belletrud and Mercier (*_Annales d'Hygiene Publique_,* June, 1904, p. 48). A weak-minded, timid youth, who was very sexual but not attractive to women, would watch for women who were about to urinate and immediately they had passed on would go and lick the spot they had moistened, at the same time masturbating. Such a fetichistic perversion is strictly analogous

to the fetichism by which women's handkerchiefs, aprons or underlinen become capable of affording sexual gratification. A very complete case of such urolagnic fetichism--complete because separated from association with the person accomplishing the act of urination--has been recorded by Moraglia in a woman. It is the case of a beautiful and attractive young woman of 18, with thick black hair, and expressive vivacious eyes, but sallow complexion. Married a year previously, but childless, she experienced a certain amount of pleasure in coitus, but she preferred masturbation, and frankly acknowledged that she was highly excited by the odor of fermented urine. So strong was this fetichism that when, for instance, she passed a street urinal she was often obliged to go aside and masturbate; once she went for this purpose into the urinal itself and was almost discovered in the act, and on another occasion into a church. Her perversion caused her much worry because of the fear of detection. She preferred, when she could, to obtain a bottle of urine--which must be stale and a man's (this, she said, she could detect by the smell)--and to shut herself up in her own room, holding the bottle in one hand and repeatedly masturbating with the other. (Moraglia, "Psicopatie Sessuali," *_Archivio di Psichiatria_*, vol. xiii, fasc. 6, p. 267, 1892.) This case is of especial interest because of the great rarity of fully developed fetichism in women. In a slight and germinal degree I believe that cases of fetichism are not uncommon in women, but they are certainly rare in a well-marked form, and Krafft-Ebing declared, even in the late editions of his *_Psychopathia Sexualis_*, that he knew of no cases in women.

So far we have been concerned with the urolagnic rather than the coprolagnic variety of scatological symbolism. Although the two are sometimes associated there is no necessary connection, and most usually there is no tendency for the one to involve the other. Urolagnia is certainly much the more frequently found; the act of urination is far more apt to suggest erotically symbolical ideas than the idea of defecation. It is not difficult to understand why this should be so. The act of urination lends itself more easily to sexual symbolism; it is more intimately associated with the genital function; its repetition is necessary at more frequent intervals so that it is more in evidence; moreover, its product, unlike that of the act of defecation, is not offensive to the senses. Still coprolagnia occurs and not so very infrequently. Burton remarked that even the normal lover is affected by

this feeling: "immo nec ipsum amicae stercus foetet."[29]

Of Caligula who, however, was scarcely sane, it was said "et quidem stercus uxoris degustavit."[30] In Parisian brothels (according to Taxil and others) provision is made for those who are sexually excited by the spectacle of the act of defecation (without reference to contact or odor) by means of a "tabouret de verre," from under the glass floor of which the spectacle of the defecating women may be closely observed. It may be added that the erotic nature of such a spectacle is referred to in the Marquis de Sade's novels.

There is one motive for the existence of coprolagnia which must not be passed over, because it has doubtless frequently served as a mode of transition to what, taken by itself, may well seem the least aesthetically attractive of erotic symbols. I refer to the tendency of the nates to become a sexual fetich. The nates have in all ages and in all parts of the world been frequently regarded as one of the most aesthetically beautiful parts of the feminine body.[31] It is probable that on the basis of this entirely normal attraction more than one form of erotic symbolism is at all events in part supported. Duehren and others have considered that the aesthetic charm of the nates is one of the motives which prompt the desire to inflict flagellation on women. In the same way--certainly in some and probably in many cases--the sexual charm of the nates progressively extends to the anal region, to the act of defecation, and finally to the feces.

In a case of Krafft-Ebing's (_Op. cit._, p. 183) the subject, when a child of 6, accidentally placed his hand in contact with the nates of the little girl who sat next to him in school, and experienced so great a pleasure in this contact that he frequently repeated it; when he was 10 a nursery governess, to gratify her own desires, placed his finger in her vagina; in adult life he developed urolagnic tendencies.

In a case of Moll's the development of a youthful admiration for the nates in a coprolagnic direction may be clearly traced. In this case a young man, a merchant, in a good position, sought to come in contact with women defecating; and with this object would seek to conceal himself in closets; the excretal odor was pleasurable to him, but was not essential to gratification, and the sight of the nates was also exciting and at the same time not essential to gratification; the act of defecation appears,

however, to have been regarded as essential. He never sought to witness prostitutes in this situation; he was only attracted to young, pretty and innocent women. The coprolagnia here, however, had its source in a childish impression of admiration for the nates. When 5 or 6 years old he crawled under the clothes of a servant girl, his face coming in contact with her nates, an impression that remained associated in his mind with pleasure. Three or four years later he used to experience much pleasure when a young girl cousin sat on his face; thus was strengthened an association which developed naturally into coprolagnia. (Moll, *Untersuchungen ueber die Libido Sexualis*, bd. i, p. 837.)

It is scarcely necessary to remark that an admiration for the nates, even when reaching a fetichistic degree, by no means necessarily involves, even after many years, any attraction to the excreta. A correspondent for whom the nates have constituted a fetich for many years writes: "I find my craving for women with profuse pelvic or posterior development is growing and I wish to copulate from behind; but I would feel a sickening feeling if any part of my person came in contact with the female anus. It is more pleasing to me to see the nates than the mons, yet I loathe everything associated with the anal region."

Moll has recorded in detail a case of what may be described as "ideal coprolagnia"--that is to say, where the symbolism, though fully developed in imagination, was not carried into real life--which is of great interest because it shows how, in a very intelligent subject, the deviated symbolism may become highly developed and irradiate all the views of life in the same way as the normal impulse. (The subject's desires were also inverted, but from the present point of view the psychological interest of the case is not thereby impaired.) Moll's case was one of symbolism of act, the excreta offering no attraction apart from the process of defecation. In a case which has been communicated to me there was, on the other hand, an olfactory fetichistic attraction to the excreta even in the absence of the person.

In Moll's case, the patient, X., 23 years of age, belongs to a family which he himself describes as nervous. His mother, who is anaemic, has long suffered from almost periodical attacks of excitement, weakness, syncope and palpitation. A brother of the mother died in a lunatic asylum, and several other brothers complain much of their nerves. The mother's sisters are very

good-natured, but liable to break out in furious passions; this they inherit from their father. There appears to be no nervous disease on the patient's father's side. X.'s sisters are also healthy.

X. himself is of powerful undersized build and enjoys good health, injured by no excesses. He considers himself nervous. He worked hard at school and was always the first in his class; he adds, however, that this is due less to his own abilities than the laziness of his school-fellows. He is, as he remarks, very religious and prays frequently, but seldom goes to church.

In regard to his psychic characters he says that he has no specially prominent talent, but is much interested in languages, mathematics, physics and philosophy, in fact, in abstract subjects generally. "While I take a lively interest in every kind of intellectual work," he says, "it is only recently that I have been attracted to real life and its requirements. I have never had much skill in physical exercises. For external things until recently I have only had contempt. I have a delicately constituted nature, loving solitude, and only associating with a few select persons. I have a decided taste for fiction, poetry and music; my temperament is idealistic and religious, with strict conceptions of duty and morality, and aspirations towards the good and beautiful. I detest all that is common and coarse, and yet I can think and act in the way you will learn from the following pages."

Regarding his sexual life, X. made the following communication: "During the last two years I have become convinced of the perversion of my sexual instinct. I had often previously thought that in me the impulse was not quite normal, but it is only lately that I have become convinced of my complete perversion. I have never read or heard of any case in which the sexual feelings were of the same kind. Although I can feel a lively inclination towards superior representatives of the female sex, and have twice felt something like love, the sight or the recollection even of a beautiful woman have never caused sexual excitement." In the two exceptional instances mentioned it appears that X. had an inclination to kiss the women in question, but that the thought of coitus had no attraction. "In my voluptuous dreams, connected with the emission of semen, women in seductive

situations have never appeared. I have never had any desire to visit a puella publica. The love-stories of my fellow-students seemed very silly, dances and balls were a horror to me, and only on very rare occasions could I be persuaded to go into society. It will be easy to guess the diagnosis in my case: I suffer from the sexual attraction of my own sex, I am a lover of boys.

"You cannot imagine what a world of thoughts, wishes, feelings and impulses the words 'knabe,' 'pais,' 'garcon,' 'boy,' 'ragazzo' have for me; one of these words, even in an unmeaning clause of a translation-book, calls before me the whole sum of associations which in course of time have become bound up with this idea, and it is only with an effort that I can scare away the wild band. This group of thoughts shows a wonderful mixture of warm sensuality and ideal love, it unites my lowest and highest impulses, the strength and the weakness of my nature, my curse and my blessing. My inclination is especially towards boys of the age of 12 to 15; though they may be rather younger or older. That I should prefer beautiful and intelligent boys is comprehensible. I do not want a prostitute, but a friend or a son, whose soul I love, whom I can help to become a more perfect man, such as I myself would willingly be.

"When I myself belonged to that happy age (i.e., below 15) I had no dearer wish than to possess a friend of similar tastes. I have sought, hoped, waited, grieved, and been at last disillusioned, overcome by desire and despair, and have not found that friend. Even later the hope often reappeared, but always in vain, and I cannot boast of that sure recognition which one reads of in the autobiographies of Urnings. I do not know personally a single fellow-sufferer. It is also doubtful whether such an acquaintanceship would greatly help me, for I have a very peculiar conception of homosexuality. As you will see, I have little more in common with what are called paederasts than sexual indifference to the female sex, and I often ask myself: 'Does any other man in the whole world feel like you? Are you alone in the earth with your morbid desires? Are you a pariah of pariahs, or is there, perhaps, another soul with similar longings living near you? How often in summer have I gone to the lakes and streams outside cities to seek boys bathing; but I always came back unsatisfied, whether I found any or not. And in winter I have been irresistibly impelled to return to the same spots, as if it

were sanctified by the boys, but my darlings had vanished and cold winds blew over the icy floods, so that I would return feeling as though I had buried all my happiness.

"It must be borne in mind, therefore, that what I have to say regarding my sexual impulses only refers to fancies and never to their practical realization. My sensual impulses are not connected with the sexual organs; all my voluptuous ideas are not in the least connected with these parts. For this reason I have never practiced onanism and immissio membri in anum is as repulsive to me as to a normal man. Even every imitation of coitus is, for me, without attraction. In a boy's body two things specially excite me: his belly and his nates, the first as containing the digestive tract, the second as holding the opening of the bowels. Of the vegetable processes of life in the boy none interest me nearly so much as the progress of his digestion and the process of defecation. It is incredible to what an extent this part of physiology has occupied me from youth. If as a boy I wanted to read something of a piquantly exciting character I sought in my father's encyclopaedia for articles like: Obstruction, Constipation, Haemorrhoids, Faeces, etc. No function of the body seemed to be so significant as this, and I regarded its disturbances as the most important in the whole mechanism of life. The description of other disorders I could read in cold blood, but intussusception of the bowels makes me ill even to-day. I am always extremely pleased to hear that the digestion of the people around me is in good condition. A man who did not sufficiently watch over his digestion aroused distrust in me, and I imagined that wicked men must be horribly indifferent regarding this weighty matter. Even more than in ordinary persons was I interested in the digestion of more mysterious beings, like magicians in legends, or men of other nations. I would willingly have made an anthropological study of my favorite subject, only to my annoyance books nearly always pass over the matter in silence. In history and fiction I regretted the absence of information concerning the state of my heroes' digestion when they languished in prison or in some unaccustomed or unhealthy spot. For this reason I held no book more precious than one which describes how a young man after being shipwrecked lived for a long time in a narrow snow-hut, and it was conscientiously stated that he became aware of digestive disturbances. No immorality angers me more than the foolish practice of ladies who in society

neglect the satisfaction of their natural needs from misplaced motives of modesty. On a railway journey I suffer horribly from the thought that one of my fellow-travelers may be prevented from fulfilling some imperative natural necessity.

"I naturally devote the greatest attention to my own digestion. With painful conscientiousness I go to stool every day at the same hour; if the operation does not come off to my satisfaction I feel not so much physical as mental discomfort. To this quite useful hygienic interest became associated at puberty a sensual interest. Since my fourteenth year I have had no greater enjoyment than to defecate undressed (I do not do so now) after having first carefully examined the distension of my abdomen. In summer I would go into the woods, undress myself in a secluded spot and indulge in the voluptuous pleasures of defecation. I would sometimes combine with this a bath in a stream. I would exhaust my imagination in the effort to invent specially enjoyable variations, longed for a desert island where I could go about naked, fill my body with much nourishing food, hold in the excrement as long as possible and then discharge it in some subtly-thought-out spot. These practices and ideas often caused erections and later on emissions, but the genitals played no part in my conceptions; their movements were uncomfortable and gave no pleasure.

"I soon longed to be associated in these orgies with some boy of the same age, but I wanted not only a companion in my passion, but also a real friend. Since there could be no question of masturbation or paederasty, our love would have been limited to kisses, embraces, and--as a compensation for coitus--defecation together. That would have been perfect bliss to me. I will spare you the unaesthetic contents of my voluptuous dreams. But I remained without a companion, and, therefore, without real enjoyment. [He has, however, on various occasions experienced erections, and even emissions, on seeing, by chance, men or boys defecate.] *Hinc illae lacrimae*; the excitement over my own defecation only took place *_faute de mieux_*.

"I knew very well that my thoughts and practices were impure and contemptible. Ah! how often, when the intoxication was over, have I thrown myself remorsefully on my knees, praying to God for pardon! For some weeks I repressed my longing; but at last it was

too strong for me, I tried to justify myself and fell into my vice anew. That I was guilty of licentiousness and loved boys sexually first became clear to me later on, when I knew the significance of erection as a sign of sexual excitement.

"No one can imagine with what demoniacal joy I am possessed at the thought of a beautiful naked boy whose abdomen is filled as the result of long abstinence from stool. The thought powerfully excites me, a flood of passion goes through my blood and my limbs tremble. I would never grow tired of feeling that belly and looking at it. My passion would express itself in tempestuous caresses, and the boy would have to assume various positions in order to show off the beauty of his form, i.e., to bring the parts in question into better view. To observe defecation would still further increase this peculiar enjoyment. If the boy's bowels were not sufficiently filled I would feed him with all sorts of food which produces much excrement, such as potatoes, coarse bread, etc. If possible I would seek to delay defecation for two or three days, so that it might be as copious as possible. When at last it occurred it would be an unspeakable joy for me to watch the faeces--which would have to be fairly firm--emerging from the anus."

X. would like to be a teacher and thinks he could exert a beneficial influence on boys. In spite of the pain he has suffered he does not think he would like to be cured of his perverse inclinations, for they have given him joy as well as pain, and the pain has chiefly been owing to the fact that he could not gratify his inclinations. X. smokes and drinks in moderation, and has no feminine habits. (The foregoing is a condensed summary of the case which is fully reported by Moll, Kontraere Sexualempfindung, third edition, pp. 295-305.)

The case of coprolagnia communicated to me is that of a married man, normal in all other respects, intellectually brilliant and filling successfully a very responsible position. When a child the women of his household were always indifferent as to his presence in their bedrooms, and would satisfy all natural calls without reserve before him. He would dream of this with erections. His sexual interests became slowly centered in the act of defecation, and this fetich throughout life never appealed to him so powerfully as when associated with the particular type of

household furniture which was used for this purpose in his own house. The act of defecation in the opposite sex or anything pertaining to or suggesting the same caused uncontrollable sexual excitement; the nates also exerted a great attraction. The alvine excreta exerted this influence even in the absence of the woman; it was, however, necessary that she should be a sexually desirable person. The perversion in this case was not complete; that is to say, that the excitement produced by the act of defecation or the excretion itself was not actually preferred to coitus; the sexual idea was normal coitus in the normal manner, but preceded by the visual and olfactory enjoyment of the exciting fetich. When coitus was not possible the enjoyment of the fetich was accompanied by masturbation (as in the analogous case of urolagnia in a woman summarized on p. 62.) On one occasion he was discovered by a friend in a bedroom belonging to a woman, engaged in the act of masturbation over a vessel containing the desired fetich. In an agony of shame he begged the mercy of silence concerning this episode, at the same time revealing his life-history. He has constantly been haunted by the dread of detection, as well as by remorse and the consciousness of degradation, also by the fear that his unconquerable obsession may lead him to the asylum.

The scatologic groups of sexual perversions, urolagnia and coprolagnia, as may be sufficiently seen in this brief summary, are not merely olfactory fetiches. They are, in a larger proportion of cases, dynamic symbols, a preoccupation with physiological acts which, by associations of contiguity and still more of resemblance, have gained the virtue of stimulating in slight cases, and replacing in more extreme cases, the normal preoccupation with the central physiological act itself. We have seen that there are various considerations which amply suffice to furnish a basis for such associations. And when we reflect that in the popular mind, and to some extent in actual fact, the sexual act itself is, like urination and defecation, an excretory act, we can understand that the true excretory acts may easily become symbols of the pseudo-excretory act. It is, indeed, in the muscular release of accumulated pressures and tensions, involved by the act of liberating the stored-up excretion, that we have the closest simulacrum of the tumescence and detumescence of the sexual process.[32]

In this way the erotic symbolism of urolagnia and coprolagnia is completely analogous with that dynamic symbolism of the clinging and

swinging garments which Herrick has so accurately described, with the complex symbolism of flagellation and its play of the rod against the blushing and trembling nates, with the symbols of sexual strain and stress which are embodied in the foot and the act of treading.

FOOTNOTES:

[24] Fuchs (*_Das Erotische Element In der Karikatur_*, p. 26), distinguishing sharply between the "erotic" and the "obscene," reserves the latter term exclusively for the representation of excretory organs and acts. He considers that this is etymologically the most exact usage. However that may be, it seems to me that, in any case, "obscene" has become so vague a term that it is now impracticable to give it a restricted and precise sense.

[25] In this connection we may profitably contemplate the hand and recall the vast gamut of functions, sacred and profane, which that organ exercises. Many savages strictly reserve the left hand to the lowlier purposes of life; but in civilization that is not considered necessary, and it may be wholesome for some of us to meditate on the more humble uses of the same hand which is raised in the supreme gesture of benediction and which men have often counted it a privilege to kiss.

[26] See, e.g., Morselli, *_Una Causa di Nullita del Matrimonio_*, 1902, p. 39.

[27] Fere, *_Comptes-Rendus Societe de Biologie_*, July 23, 1904.

[28] Transactions of the International Medical Congress, Moscow, vol. iv, p. 19. A similar symbolism may be traced in many of the cases in which the focus of modesty becomes in modest women centered in the excretory sphere and sometimes exaggerated to the extent of obsession. It must not be supposed, however, that every obsession in this sphere has a symbolical value of an erotic kind. In the case, for instance, which has been recorded by Raymond and Janet (*_Les Obsessions_*, vol. ii, p. 306) of a woman who spent much of her time in the endeavor to urinate perfectly, always feeling that she failed in some respect, the obsession seems to have risen fortuitously on a somewhat neurotic basis without reference to the sexual life.

[29] *_Anatomy of Melancholy_*, Part III, Section II, Mem. III, Subs. I.

[30] It may be remarked here that while the eating of excrement (apart from its former use as a magic charm and as a therapeutic agent) is in civilization now confined to sexual perverts and the insane, among some animals it is normal as a measure of hygiene in relation to their young. Thus, as, e.g., the Rev. Arthur East writes, the mistle thrush swallows the droppings of its young. (Knowledge, June 1, 1899, p. 133.) In the dog I have observed that the bitch licks her puppies shortly after birth as they urinate, absorbing the fluid.

[31] See, e.g., the previous volume of these Studies, "Sexual Selection in Man," pp. 165 et seq., and Duehren, Geschlechtsleben in England, bd. ii, pp. 258, et seq.

[32] In the study of Love and Pain in a previous volume (p. 130) I have quoted the remarks of a lady who refers to the analogy between sexual tension and vesical tension--"Cette volupte que ressentent les bords de la mer, d'etre toujours pleins sans jamais deborder"--and its erotic significance.

IV.

Animals as Sources of Erotic Symbolism--Mixoscopic Zoophilia--The Stuff-fetichisms--Hair-fetichism--The Stuff-fetichisms Mainly on a Tactile Base--Erotic Zoophilia--Zooerastia--Bestiality--The Conditions that Favor Bestiality--Its Wide Prevalence Among Primitive Peoples and Among Peasants--The Primitive Conception of Animals--The Goat--The Influence of Familiarity with Animals--Congress Between Women and Animals--The Social Reaction Against Bestiality.

The erotic symbols with which we have so far been concerned have in every case been portions of the body, or its physiological processes, or at least the garments which it has endowed with life. The association on which the symbol has arisen has in every case been in large measure, although not entirely, an association of contiguity. It is now necessary to touch on a group of sexual symbols in which the association of contiguity with the human body is absent: the various methods by which animals or animal products or the sight of animal copulation may arouse

sexual desire in human persons. Here we encounter a symbolism mainly founded on association by resemblance; the animal sexual act recalls the human sexual act; the animal becomes the symbol of the human being.

The group of phenomena we are here concerned with includes several subdivisions. There is first the more or less sexual pleasure sometimes experienced, especially by young persons, in the sight of copulating animals. This I would propose to call Mixoscopic Zoophilia; it falls within the range of normal variation. Then we have the cases in which the contact of animals, stroking, etc., produces sexual excitement or gratification; this is a sexual fetichism in the narrow sense, and is by Krafft-Ebing termed Zoophilia Erotica. We have, further, the class of cases in which a real or simulated sexual intercourse with animals is desired. Such cases are not regarded as fetichism by Krafft-Ebing,[33] but they come within the phenomena of erotic symbolism as here understood. This class falls into two divisions: one in which the individual is fairly normal, but belongs to a low grade of culture; the other in which he may belong to a more refined social class, but is affected by a deep degree of degeneration. In the first case we may properly apply the term bestiality; in the second case it may perhaps be better to use the term zooerastia, proposed by Krafft-Ebing.[34]

Among children, both boys and girls, it is common to find that the copulation of animals is a mysteriously fascinating spectacle. It is inevitable that this should be so, for the spectacle is more or less clearly felt to be the revelation of a secret which has been concealed from them. It is, moreover, a secret of which they feel intimate reverberations within themselves, and even in perfectly innocent and ignorant children the sight may produce an obscure sexual excitement.[35] It would seem that this occurs more frequently in girls than in boys. Even in adult age, it may be added, women are liable to experience the same kind of emotion in the presence of such spectacles. One lady recalls, as a girl, that on several occasions an element of physical excitement entered into the feelings with which she watched the coquetry of cats. Another lady mentions that at the age of about 25, and when still quite ignorant of sexual matters, she saw from a window some boys tickling a dog and inducing sexual excitement in the animal; she vaguely divined what they were doing, and though feeling disgust at their conduct she at the same time experienced in a strong degree what she now knows was sexual excitement. The coupling of the larger animals is often an impressive and splendid spectacle which is far, indeed, from being obscene, and has commended itself to persons of intellectual distinction;[36] but in young

or ill-balanced minds such sights tend to become both prurient and morbid. I have already referred to the curious case of a sexually hyperaesthetic nun who was always powerfully excited by the sight or even the recollection of flies in sexual connection, so that she was compelled to masturbate; this dated from childhood. After becoming a nun she recorded having had this experience, followed by masturbation, more than four hundred times.[37] Animal spectacles sometimes produce a sexual effect on children even when not specifically sexual; thus a correspondent, a clergyman, informs me that when a young and impressionable boy, he was much affected by seeing a veterinary surgeon insert his hand and arm into a horse's rectum, and dreamed of this several times afterward with emissions.

While the contemplation of animal coitus is an easily intelligible and in early life, perhaps, an almost normal symbol of sexual emotion, there is another subdivision of this group of animal fetichisms which forms a more natural transition from the fetichisms which have their center in the human body: the stuff-fetichisms, or the sexual attraction exerted by various tissues, perhaps always of animal origin. Here we are in the presence of a somewhat complicated phenomenon. In part we have, in a considerable number of such cases, the sexual attraction of feminine garments, for all such tissues are liable to enter into the dress. In part, also, we have a sexual perversion of tactile sensibility, for in a considerable proportion of these cases it is the touch sensations which are potent in arousing the erotic sensations. But in part, also, it would seem, we have here the conscious or subconscious presence of an animal fetich, and it is notable that perhaps all these stuffs, and especially fur, which is by far the commonest of the groups, are distinctively animal products. We may perhaps regard the fetich of feminine hair--a much more important and common fetich, indeed, than any of the stuff fetichisms--as a link of transition. Hair is at once an animal and a human product, while it may be separated from the body and possesses the qualities of a stuff. Krafft-Ebing remarks that the senses of touch, smell, and hearing, as well as sight, seem to enter into the attraction exerted by hair.

The natural fascination of hair, on which hair-fetichism is founded, begins at a very early age. "The hair is a special object of interest with infants," Stanley Hall concludes, "which begins often in the latter part of the first year.... The hair, no doubt, gives quite unique tactile sensations, both in its own roots and to hands, and is plastic and yielding to the motor sense, so that the earliest interest may be akin to that in fur,

which is a marked object in infant experience. Some children develop an almost fetichistic propensity to pull or later to stroke the hair or beard of every one with whom they come in contact." (G. Stanley Hall, "The Early Sense of Self," *American Journal of Psychology*, April, 1898, p. 359.)

It should be added that the fascination of hair for the infantile and childish mind is not necessarily one of attraction, but may be of repulsion. It happens here, as in the case of so many characteristics which are of sexual significance, that we are in the presence of an object which may exert a dynamic emotional force, a force which is capable of repelling with the same energy that it attracts. Fere records the instructive case of a child of 3, of psychopathic heredity, who when he could not sleep was sometimes taken by his mother into her bed. One night his hand came in contact with a hairy portion of his mother's body, and this, arousing the idea of an animal, caused him to leap out of the bed in terror. He became curious as to the cause of his terror and in time was able to observe "the animal," but the train of feelings which had been set up led to a life-long indifference to women and a tendency to homosexuality. It is noteworthy that he was attracted to men in whom the hair and other secondary sexual characters were well developed. (Fere, *L'Instinct Sexuel*, second edition, pp. 262-267.)

As a sexual fetich hair strictly belongs to the group of parts of the body; but since it can be removed from the body and is sexually effective as a fetich in the absence of the person to whom it belongs, it is on a level with the garments which may serve in a similar way, with shoes or handkerchiefs or gloves. Psychologically, hair-fetichism presents no special problem, but the wide attraction of hair--it is sexually the most generally noted part of the feminine body after the eyes--and the peculiar facility with which when plaited it may be removed, render hair-fetichism a sexual perversion of specially great medico-legal interest.

The frequency of hair-fetichism, as well as of the natural admiration on which it rests, is indicated by a case recorded by Laurent. "A few years ago," he states, "one constantly saw at the Bal Bullier, in Paris, a tall girl whose face was lean and bony, but whose black hair was of truly remarkable length. She wore it

flowing down her shoulders and loins. Men often followed her in the street to touch or kiss the hair. Others would accompany her home and pay her for the mere pleasure of touching and kissing the long black tresses. One, in consideration of a relatively considerable sum, desired to pollute the silky hair. She was obliged to be always on her guard, and to take all sorts of precautions to prevent any one cutting off this ornament, which constituted her only beauty as well as her livelihood." (E. Laurent, *L'Amour Morbide*, 1891, p. 164; also the same author's *Fetichistes et Erotomanes*, p. 23.)

The hair despoiler (*Coupeur des Nattes* or *Zopfabschneider*) may be found in any civilized country, though the most carefully studied cases have occurred in Paris. (Several medico-legal histories of hair-despoilers are summarized by Krafft-Ebing, *Op. cit.*, pp. 329-334). Such persons are usually of nervous temperament and bad heredity; the attraction to hair occasionally develops in early life; sometimes the morbid impulse only appears in later life after fever. The fetich may be either flowing hair or braided hair, but is usually one or the other, and not both. Sexual excitement and ejaculation may be produced in the act of touching or cutting off the hair, which is subsequently, in many cases, used for masturbation. As a rule the hair-despoiler is a pure fetichist, no element of sadistic pleasure entering into his feelings. In the case of a "capillary kleptomaniac" in Chicago--a highly intelligent and athletic married young man of good family--the impulse to cut off girls' braids appeared after recovery from a severe fever. He would gaze admiringly at the long tresses and then clip them off with great rapidity; he did this in some fifty cases before he was caught and imprisoned. He usually threw the braids away before he reached home. (*Alienist and Neurologist*, April, 1889, p. 325.) In this case there is no history of sexual excitement, probably because no proper medico-legal examination was made. (It may be added that hair-despoilers have been specially studied by Motet, "Les Coupeurs de Nattes," *Annales d'Hygiene*, 1890.)

The stuff-fetiches are most usually fur and velvet; feathers, silk, and leathers also sometimes exert this influence; they are all, it will be noted, animal substances.[38] The most interesting is probably fur, the attraction of which is not uncommon in association with passive algolagnia. As Stanley Hall has shown, the fear of fur, as well as the

love of it, is by no means uncommon in childhood; it may appear even in infancy and in children who have never come in contact with animals.[39] It is noteworthy that in most cases of uncomplicated stuff-fetichism the attraction apparently arises on a congenital basis, as it appears in persons of nervous or sensitive temperament at an early age and without being attached to any definite causative incident. The sexual excitation is nearly always produced by the touch rather than by the sight. As we found, when dealing with the sense of touch in the previous volume, the specific sexual sensations may be regarded as a special modification of ticklishness. The erotic symbolism in the case of these stuff-fetichisms would seem to be a more or less congenital perversion of ticklishness in relation to specific animal contacts.

A further degree of perversion in this direction is reached in a case of erotic zoophilia, recorded by Krafft-Ebing.[40] In this case a congenital neuropath, of good intelligence but delicate and anaemic, with feeble sexual powers, had a great love of domestic animals, especially dogs and cats, from an early age; when petting them he experienced sexual emotions, although he was innocent in sexual matters. At puberty he realized the nature of his feelings and tried to break himself of his habits. He succeeded, but then began erotic dreams accompanied by images of animals, and these led to masturbation associated with ideas of a similar kind. At the same time he had no wish for any sort of sexual intercourse with animals, and was indifferent as to the sex of the animals which attracted him; his sexual ideals were normal. Such a case seems to be fundamentally one of fetichism on a tactile basis, and thus forms a transition between the stuff-fetichisms and the complete perversions of sexual attraction toward animals.

In some cases sexually hyperaesthetic women have informed me that sexual feeling has been produced by casual contact with pet dogs and cats. In such cases there is usually no real perversion, but it seems probable that we may here have an occasional foundation for the somewhat morbid but scarcely vicious excesses of affection which women are apt to display towards their pet dogs or cats. In most cases of this affection there is certainly no sexual element; in the case of childless women, it may rather be regarded as a maternal than as an erotic symbolism. (The excesses of this non-erotic zoophilia have been discussed by Fere, L'Instinct Sexuel, second edition, pp. 166-171.)

Krafft-Ebing considers that complete perversion of sexual attraction

toward animals is radically distinct from erotic _zoophilia_. This view cannot be accepted. Bestiality and _zoerastia_ merely present in a more marked and profoundly perverted form a further degree of the same phenomenon which we meet with in erotic _zoophilia_ ; the difference is that they occur either in more insensitive or in more markedly degenerate persons.

A fairly typical case of _zoerastia_ has been recorded in America by Howard, of Baltimore. This was the case of a boy of 16, precociously mature and fairly bright. He was, however, indifferent to the opposite sex, though he had ample opportunity for gratifying normal passions. His parents lived in the city, but the youth had an inordinate desire for the country and was therefore sent to school in a village. On the second day after his arrival at school a farmer missed a sow which was found secreted in an outhouse on the school grounds. This was the first of many similar incidents in which a sow always took part. So strong was his passion that on one occasion force had to be used to take him away from the sow he was caressing. He did not masturbate, and even when restrained from approaching sows he had no sexual inclination for other animals. His nocturnal pollutions, which were frequent, were always accompanied by images of wallowing swine. Notwithstanding careful treatment no cure was effected; mental and physical vigor failed, and he died at the age of 23.[41]

It is, however, somewhat doubtful whether we can always or even usually distinguish between zoerastia and bestiality. Dr. G.F. Lydston, of Chicago, has communicated to me a case (in which he was consulted) which seems fairly typical and is instructive in this respect. The subject was a young man of 21, a farmer's son, not very bright intellectually, but very healthy and strong, of great assistance on the farm, very capable and industrious, such a good farm hand that his father was unwilling to send him away and to lose his services. There was no history of insanity or neurosis in the family, and no injury or illness in his own history. He had spells of moroseness and irritability, however, and had also been a masturbator. Women had no attraction for him, but he would copulate with the mares upon his father's farm, and this without regard to time, place, or spectators. Such a case would seem to stand midway between ordinary bestiality and pathological zoerastia as defined by Krafft-Ebing, yet it seems probable that in most cases of ordinary bestiality some slight traces of mental anomaly might be found, if such cases always were, as they should be, properly investigated.[42]

We have here reached the grossest and most frequent perversion in this group; bestiality, or the impulse to attain sexual gratification by intercourse, or other close contact, with animals. In seeking to comprehend this perversion it is necessary to divest ourselves of the attitude toward animals which is the inevitable outcome of refined civilization and urban life. Most sexual perversions, if not in large measure the actual outcome of civilized life, easily adjust themselves to it. Bestiality (except in one form to be noted later) is, on the other hand, the sexual perversion of dull, insensitive and unfastidious persons. It flourishes among primitive peoples and among peasants. It is the vice of the clodhopper, unattractive to women or inapt to court them.

Three conditions have favored the extreme prevalence of bestiality: (1) primitive conceptions of life which built up no great barrier between man and the other animals; (2) the extreme familiarity which necessarily exists between the peasant and his beasts, often combined with separation from women; (3) various folk-lore beliefs such as the efficacy of intercourse with animals as a cure for venereal disease, etc.[43]

The beliefs and customs of primitive peoples, as well as their mythology and legends, bring before us a community of man and animals altogether unlike anything we know in civilization. Men may become animals and animals may become men; animals and men may communicate with each other and live on terms of equality; animals may be the ancestors of human tribes; the sacred totems of savages are most usually animals. There is no shame or degradation in the notion of a sexual relationship between men and animals, because in primitive conceptions animals are not inferior beings separated from man by a great gulf. They are much more like men in disguise, and in some respects possess powers which make them superior to men. This is recognized in those plays, festivals, and religious dances, so common among primitive peoples, in which animal disguises are worn.[44] When men admire and emulate the qualities of animals and are proud to believe that they descend from them, it is not surprising that they should sometimes see nothing derogatory in sexual intercourse with them.[45]

A significant relic of primitive conceptions in this matter may perhaps be found in the religious rites connected with the sacred goat of Mendes described by Herodotus. After telling how the Mendesians reverence the goat, especially the he-goat, out of their veneration for Pan, whom they represent as a goat ("the real motive which they assign for this custom I do not choose to relate"), he adds: "It happened in this country, and within my remembrance, and was indeed universally notorious, that a goat

had indecent and public communication with a woman." [46] The meaning of the passage evidently is that in the ordinary intercourse of women with the sacred goat, connection was only simulated or incomplete on account of the natural indifference of the goat to the human female, but that in rare cases the goat proved sexually excitable with the woman and capable of connection. [47] The goat has always been a kind of sacred emblem of lust. In the middle ages it became associated with the Devil as one of the favorite forms he assumed. It is significant of a primitively religious sexual association between men and animals, that witches constantly confessed, or were made to confess, that they had had intercourse with the Devil in the shape of an animal, very frequently a dog. The figures of human beings and animals in conjunction carved on temples in India, also seem to indicate the religious significance which this phenomenon sometimes presents. There is, indeed, no need to go beyond Europe even in her moments of highest culture to find a religious sanction for sexual union between human beings, or gods in human shape, and animals. The legends of Io and the bull, of Leda and the swan, are among the most familiar in Greek mythology, and in a later pictorial form they constitute some of the most cherished works of the painters of the Renaissance.

As regards the prevalence of occasional sexual intercourse between men or women and animals among primitive peoples at the present time, it is possible to find many scattered references by travelers in all parts of the world. Such references by no means indicate that such practices are, as a rule, common, but they usually show that they are accepted with a good-humored indifference. [48]

Bestiality is very rarely found in towns. In the country this vice of the clodhopper is far from infrequent. For the peasant, whose sensibilities are uncultivated and who makes but the most elementary demands from a woman, the difference between an animal and a human being in this respect scarcely seems to be very great. "My wife was away too long," a German peasant explained to the magistrate, "and so I went with my sow." It is certainly an explanation that to the uncultivated peasant, ignorant of theological and juridical conceptions, must often seem natural and sufficient.

Bestiality thus resembles masturbation and other abnormal manifestations of the sexual impulse which may be practiced merely *_faute de mieux_* and not as, in the strict sense, perversions of the impulse. Even necrophily may be thus practiced. A young man who when assisting the grave-digger

conceived and carried out the idea of digging up the bodies of young girls to satisfy his passions with, and whose case has been recorded by Belletrud and Mercier, said: "I could find no young girl who would agree to yield to my desires; that is why I have done this. I should have preferred to have relations with living persons. I found it quite natural to do what I did: I saw no harm in it, and I did not think that any one else could. As living women felt nothing but repulsion for me, it was quite natural I should turn to the dead, who have never repulsed me. I used to say tender things to them like 'my beautiful, my love, I love you.'" (Belletrud and Mercier "Perversion de l'Instinct Genesique," Annales d'Hygiene Publique, June, 1903.) But when so highly abnormal an act is felt as natural we are dealing with a person who is congenitally defective so far as the finer developments of intelligence are concerned. It was so in this case of necrophily; he was the son of a weak-minded woman of unrestrainable sexual inclinations, and was himself somewhat feeble-minded; he was also, it is instructive to observe, anosmic.

But it is by no means only their dulled sensibility or the absence of women, which accounts for the frequency of bestiality among peasants. A highly important factor is their constant familiarity with animals. The peasant lives with animals, tends them, learns to know all their individual characters; he understands them far better than he understands men and women; they are his constant companions, his friends. He knows, moreover, the details of their sexual lives, he witnesses the often highly impressive spectacle of their coupling. It is scarcely surprising that peasants should sometimes regard animals as being not only as near to them as their fellow human beings, but even nearer.

The significance of the factor of familiarity is indicated by the great frequency of bestiality among shepherds, goatherds, and others whose occupation is exclusively the care of animals. Mirabeau, in the eighteenth century, stated, on the evidence of Basque priests, that all the shepherds in the Pyrenees practice bestiality. It is apparently much the same in Italy.[49] In South Italy and Sicily, especially, bestiality among goatherds and peasants is said to be almost a national custom.[50] In the extreme north of Europe, it is reported, the reindeer, in this respect, takes the place of the goat.

The importance of the same factor is also shown by the fact that when

among women in civilization animal perversions appear, the animal is nearly always a pet dog. Usually in these cases the animal is taught to give gratification by _cunnilingus_. In some cases, however, there is really sexual intercourse between the animal and the woman.

Moll mentions that in a case of _cunnilingus_ by a dog in Germany there was a difficulty as to whether the matter should be considered an unnatural offence or simply an offence against decency; the lower court considered it in the former light, while the higher court took the more merciful view. (Moll, *Untersuchungen ueber die Libido Sexualis*, bd. i, p. 697.) In a case reported by Pfaff and mentioned by Moll, a country girl was accused of having sexual intercourse with a large dog. On examination Pfaff found in the girl's thick pubic hair a loose hair which under the microscope proved to belong to the dog. (*Loc. cit.*, p. 698.) In such a case it must be noted that while this evidence may be held to show sexual contact with the dog, it scarcely suffices to show sexual intercourse. This has, however, undoubtedly occurred from time to time, even more or less openly. Bloch (*Op. cit.*, pp. 277 and 282) remarks that this is not an infrequent exhibition given by prostitutes in certain brothels. Maschka has referred to such an exhibition between a woman and a bull-dog, which was given to select circles in Paris. Rosse refers to a case in which a young unmarried woman in Washington was surprised during intercourse with a large English mastiff, who in his efforts to get loose caused such severe injuries that the woman died from haemorrhage in about an hour. Rosse also mentions that some years ago a performance of this kind between a prostitute and a Newfoundland dog could be witnessed in San Francisco by paying a small sum; the woman declared that a woman who had once copulated with a dog would ever afterwards prefer this animal to a man. Rosse adds that he was acquainted with a similar performance between a woman and a donkey, which used to take place in Europe (Irving Rosse, "Sexual Hypochondriasis and Perversion of the Genesic Instinct," *Virginia Medical Monthly*, October, 1892, p. 379). Juvenal mentions such relations between the donkey and woman (vi, 332). Krauss (quoted by Bloch, *Beitraege zur Aetiologie der Psychopathia Sexualis*, Teil II, p. 276) states that in Bosnia women sometimes carry on these practices with dogs and also--as he would not have believed had he not on one occasion observed it--with cats. "It seems to me," writes Dr. Kiernan, of Chicago, (private letter) "that what Rosse

says of the animal exhibitions in San Francisco is true of all great cities. The animal employed in such exhibitions here has usually been a donkey, and in one instance death occurred from the animal trampling the girl partner. The practice described occurs in country regions quite frequently. Thus in a case reported in the suburbs of Omaha, Nebraska, a sixteen-year-old boy engaged in rectal coitus with a large dog. In attempting to extricate his swollen penis from the boy's rectum the dog tore through the _sphincter ani_ an inch into the gluteus muscles. (_Omaha Clinic_, March, 1893.) In a Missouri case, which I verified, a smart, pretty, well-educated country girl was found with a profuse offensive vaginal discharge which had been present for about a week, coming on suddenly. After washing the external genitals and opening the labia three rents were discovered, one through the fourchette and two through the left nymphae. The vagina was excessively congested and covered with points bleeding on the slightest irritation. The patient confessed that one day while playing with the genitals of a large dog she became excited and thought she would have slight coitus. After the dog had made an entrance she was unable to free herself from him, as he clasped her so firmly with his fore legs. The penis became so swollen that the dog could not free himself, although for more than an hour she made persistent efforts to do so. (_Medical Standard_, June, 1903, p. 184). In an Indiana case, concerning which I was consulted, the girl was a hebephreniac who had resorted to this procedure with a Newfoundland dog at the instance of another girl, seemingly normal as regards mentality, and had been badly injured; a discharge resulted which resembled gonorrhoea, but contained no gonococci. These cases are probably more frequent than is usually assumed."

Women are known to have had intercourse with various other animals, occasionally or habitually, in various parts of the world. Monkeys have been mentioned in this connection. Moll remarks that it seems to be an indication of an abnormal interest in monkeys that some women are observed by the attendants in the monkey-house of zoological gardens to be very frequent visitors. Near the Amazon the traveler Castelnau saw an enormous Coati monkey belonging to an Indian woman and tried to purchase it; though he offered a large sum, the woman only laughed. "Your efforts are useless," remarked an Indian in the same cabin, "he is her husband." (So far as the early literature of this subject

is concerned, a number of facts and fables regarding the congress of women with dogs, goats and other animals was brought together at the beginning of the eighteenth century by Schurig in his Gynaecologia, Section II, cap. VII; I have not drawn on this collection.)

In some cases women, and also men, find gratification in the sexual manipulation of animals without any kind of congress. This may be illustrated by an observation communicated to me by a correspondent, a clergyman. "In Ireland, my father's house adjoined the residence of an archdeacon of the established church. I was then about 20 and was still kept in religious awe of evil ways. The archdeacon had two daughters, both of whom he brought up in great strictness, resolved that they should grow up examples of virtue and piety. Our stables adjoined, and were separated only by a thin wall in which was a doorway closed up by some boards, as the two stables had formerly been one. One night I had occasion to go to our stable to search for a garden tool I had missed, and I heard a door open on the other side, and saw a light glimmer through the cracks of the boards. I looked through to ascertain who could be there at that late hour, and soon recognized the stately figure of one of the daughters, F.F. was tall, dark and handsome, but had never made any advances to me, nor had I to her. She was making love to her father's mare after a singular fashion. Stripping her right arm, she formed her fingers into a cone, and pressed on the mare's vulva. I was astonished to see the beast stretching her hind legs as if to accommodate the hand of her mistress, which she pushed in gradually and with seeming ease to the elbow. At the same time she seemed to experience the most voluptuous sensation, crisis after crisis arriving." My correspondent adds that, being exceedingly curious in the matter, he tried a somewhat similar experiment himself with one of his father's mares and experienced what he describes as "a most powerful sexual battery" which produced very exciting and exhausting effects. Naecke (Psychiatrische en Neurologische Bladen, 1899, No. 2) refers to an idiot who thus manipulated the vulva of mares in his charge. The case has been recorded by Guillereau (Journal de Medicine Veterinaire et de Zootechnie, January, 1899) of a youth who was accustomed to introduce his hand into the vulva of cows in order to obtain sexual excitement.

The possibility of sexual excitement between women and animals involves a certain degree of sexual excitability in animals from contact with women. Darwin stated that there could be no doubt that various quadrumanous animals could distinguish women from men--in the first place probably by smell and secondarily by sight--and be thus liable to sexual excitement. He quotes the opinions on this point of Youatt, Brehm, Sir Andrew Smith and Cuvier (*_Descent of Man_*, second edition, p. 8). Moll quotes the opinion of an experienced observer to the same effect (*_Untersuchungen ueber die Libido Sexualis_*, Bd. i, p. 429). Hufeland reported the case of a little girl of three who was playing, seated on a stool, with a dog placed between her thighs and locked against her. Seemingly excited by this contact the animal attempted a sort of copulation, causing the genital parts of the child to become inflamed. Bloch (*_Op. cit._*, p. 280, *_et seq._*) discusses the same point; he does not consider that animals will of their own motion sexually cohabit with women, but that they may be easily trained to it. There can be no doubt that dogs at all events are sometimes sexually excited by the presence of women, perhaps especially during menstruation, and many women are able to bear testimony to the embarrassing attentions they have sometimes received from strange dogs. There can be no difficulty in believing that, so far as *_cunnilinctus_* is concerned dogs would require no training. In a case recorded by Moll (*_Kontraere Sexualempfindung_*, third edition, p. 560) a lady states that this was done to her when a child, as also to other children, by dogs who, she said, showed signs of sexual excitement. In this case there was also sexual excitement thus produced in the child, and after puberty mutual *_cunnilinctus_* was practiced with girl friends. Guttzeit (*_Dreissig Jahre Praxis_*, Theil I, p. 310) remarks that some Russian officers who were in the Turkish campaign of 1828 told him that from fear of venereal infection in Wallachia they refrained from women and often used female asses which appeared to show signs of sexual pleasure.

A very large number of animals have been recorded as having been employed in the gratification of sexual desire at some period or in some country, by men and sometimes by women. Domestic animals are naturally those which most frequently come into question, and there are few if any of these which can altogether be excepted. The sow is one of the animals most frequently abused in this manner.[51] Cases in which mares, cows, and

donkeys figure constantly occur, as well as goats and sheep. Dogs, cats, and rabbits are heard of from time to time. Hens, ducks, and, especially in China, geese, are not uncommonly employed. The Roman ladies were said to have had an abnormal affection for snakes. The bear and even the crocodile are also mentioned.[52]

The social and legal attitude toward bestiality has reflected in part the frequency with which it has been practiced, and in part the disgust mixed with mystical and sacrilegious horror which it has aroused. It has sometimes been met merely by a fine, and sometimes the offender and his innocent partner have been burnt together. In the middle ages and later its frequency is attested by the fact that it formed a favorite topic with preachers of the fifteenth and sixteenth centuries. It is significant that in the Penitentials,--which were criminal codes, half secular and half spiritual, in use before the thirteenth century, when penance was relegated to the judgment of the confessor,--it was thought necessary to fix the periods of penance which should be undergone respectively by bishops, priests and deacons who should be guilty of bestiality.

In Egbert's Penitential, a document of the ninth and tenth centuries, we read (V. 22): "Item Episcopus cum quadrupede fornicans VII annos, consuetudinem X, presbyter V, diaconus III, clerus II." There was a great range in the penances for bestiality, from ten years to (in the case of boys) one hundred days. The mare is specially mentioned (Haddon and Stubbs, *Councils and Ecclesiastical Documents*, vol. iii, p. 422). In Theodore's Penitential, another Anglo-Saxon document of about the same age, those who habitually fornicate with animals are adjudged ten years of penance. It would appear from the *Penitientiale Pseudo-Romanum* (which is earlier than the eleventh century) that one year's penance was adequate for fornication with a mare when committed by a layman (exactly the same as for simple fornication with a widow or virgin), and this was mercifully reduced to half a year if he had no wife. (Wasserschleben, *Die Bussordnungen der Abendländlichen Kirche*, p. 366). The *Penitientiale Hubertense* (emanating from the monastery of St. Hubert in the Ardennes) fixes ten years' penance for sodomy, while Fulbert's Penitential (about the eleventh century) fixes seven years for either sodomy or bestiality. Burchard's Penitential, which is always detailed and precise, specially mentions the mare, the cow and the ass, and assigns forty days bread and water and seven years penance, raised to ten

years in the case of married men. A woman having intercourse with a horse is assigned seven years penance in Burchard's Penitential. (Wasserschleben, ib. pp. 651, 659.)

The extreme severity which was frequently exercised toward those guilty of this offense, was doubtless in large measure due to the fact that bestiality was regarded as a kind of sodomy, an offense which was frequently viewed with a mystical horror apart altogether from any actual social or personal injury it caused. The Jews seem to have felt this horror; it was ordered that the sinner and his victim should both be put to death (Exodus, Ch. 22, v. 19; Leviticus, Ch. 20, v. 15). In the middle ages, especially in France, the same rule often prevailed. Men and sows, men and cows, men and donkeys were burnt together. At Toulouse a woman was burnt for having intercourse with a dog. Even in the seventeenth century a learned French lawyer, Claude Lebrun de la Rochette, justified such sentences.[53] It seems probable that even to-day, in the social and legal attitude toward bestiality, sufficient regard is not paid to the fact that this offense is usually committed either by persons who are morbidly abnormal or who are of so low a degree of intelligence that they border on feeble-mindedness. To what extent, and on what grounds, it ought to be punished is a question calling for serious reconsideration.

FOOTNOTES:

[33] For Krafft-Ebing's discussion of the subject see *_Op. cit._*, pp. 530-539.

[34] In England it is not uncommon to use the term "unnatural offence;" this is an awkward and possibly misleading practice which should not be followed. In Germany a similar confusion is caused by applying the term "sodomy" to these cases as well as to pederasty. Krafft-Ebing considers that this error is due to the jurists, while the theologians have always distinguished correctly. In this matter, he adds, science must be *_ancilla theologiae_* and return to the correct usage of words.

[35] This childish interest, with later abnormal developments, may be seen in History I of the Appendix to this volume.

[36] The Countess of Pembroke, Sir Philip Sidney's sister, appears to have found sexual enjoyment in the contemplation of the sexual prowess of stallions. Aubrey writes that she "was very salacious and she had a

contrivance that in the spring of the year ... the stallions ... were to be brought before such a part of the house where she had a vidette to look on them." (*_Short Lives_*, 1898, vol. i, p. 311.) Although the modern editor's modesty has caused the disappearance of several lines from this passage, the general sense is clear. In the same century Burchard, the faithful secretary of Pope Alexander VI, describes in his invaluable diary how four race horses were brought to two mares in a court of the Vatican, the horses clamorously fighting for the possession of the mares and eventually mounting them, while the Pope and his daughter Lucrezia looked on from a window "cum magno risu et delectatione." (*_Diarium_*, ed Thuasne, vol. III, p. 169.)

[37] *_Archivio di Psichiatria_*, 1902, fasc. ii-iii, p. 338. In the case of pathological sexuality in a boy of 15, reported by A. MacDonald, and already summarized, the sight of copulating flies is also mentioned among many other causes of sexual excitation.

[38] Krafft-Ebing presents or quotes typical cases of all these fetiches, *_Op. cit._*, pp. 255-266.

[39] G. Stanley Hall, "A study of Fears," *_American Journal of Psychology_*, 1897, pp. 213-215.

[40] *_Op. cit._*, p. 268.

[41] W. Howard, "Sexual Perversion," *_Alienist and Neurologist_*, January, 1896. Krafft-Ebing (*op. cit.*, p. 532) quotes from Boeteau the somewhat similar case of a gardener's boy of 16--an illegitimate child of neuropathic heredity and markedly degenerate--who had a passion, of irresistible and impulsive character, for rabbits. He was declared irresponsible. Moll (*_Untersuchungen ueber die Libido Sexualis_*, bd. i, pp. 431-433) presents the case of a neurotic man who from the age of 15 had been sexually excited by the sight of animals or by contact with them. He had repeatedly had connection with cows and mares; he was also sexually excited by sheep, donkeys, and dogs, whether female or male; the normal sexual instinct was weak and he experienced very slight attraction to women.

[42] Moll also remarks ("Perverse Sexualempfindung," in Senator's and Kaminer's *_Krankheiten und Ehe_*) that in this matter it is often hardly possible to draw a sharp line between vice and disease.

[43] Instances of this widespread belief--found among the Tamils of Ceylon as well as in Europe--are quoted from various authors by Bloch, *Beitraege zur AEtologie der Psychopathia Sexualis*, Teil II, p. 278, and Moll, *Untersuchungen ueber die Libido Sexualis*, bd. i, p. 700. On the frequency of bestiality, from one cause or another, in the East, see, e.g., Stern, *Medizin und Geschlechtsleben in der Tuerkei*, bd. ii, p. 219.

[44] Sometimes (as among the Aleuts) the animal pantomime dances of savages may represent the transformation of a captive bird into a lovely woman who falls exhausted into the arms of the hunter. (H.H. Bancroft, *Native Races of the Pacific*, vol. i, p. 93.) A system of beliefs which accepts the possibility that a human being may be latent in an animal obviously favors the practice of bestiality.

[45] For an example of the primitive confusion between the intercourse of women with animals and with men see, e.g., Boas, "Sagen aus British-Columbia," *Zeitschrift fuer Ethnologie*, heft V, p. 558.

[46] Herodotus, Book II, Chapter 46.

[47] Dulare (*Des Divinites Generatrices*, Chapter II) brings together the evidence showing that in Egypt women had connection with the sacred goat, apparently in order to secure fertility.

[48] Various facts and references bearing on this subject are brought together by Blumenbach, *Anthropological Memoirs*, translated by Bendyshe, p. 80; Block, *Beitraege zur AEtologie der Psychopathia Sexualis*, Teil II, pp. 276-283; also Ploss and Bartels, *Das Weib*, seventh edition, p. 520.

[49] Mantegazza mentions (*Gli Amori degli Uomini*, cap V) that at Rimini a young goatherd of the Apennines, troubled with dyspepsia and nervous symptoms, told him this was due to excesses with the goats in his care. A finely executed marble group of a satyr having connection with a goat, found at Herculaneum and now in the Naples Museum (reproduced in Fuchs's *Erotische Element in der Karikatur*), perhaps symbolizes a traditional and primitive practice of the goatherd.

[50] Bayle (*Dictionary*, Art, Bathyllus) quotes various authorities concerning the Italian auxiliaries in the south of France in the sixteenth century and their custom of bringing and using goats for this purpose. Warton in the eighteenth century was informed that in Sicily priests in

confession habitually inquired of herdsmen if they had anything to do with their sows. In Normandy priests are advised to ask similar questions.

[51] It is worth noting that in Greek the word *choiros* means both a sow and a woman's pudenda; in the *Acharnians* Aristophanes plays on this association at some length. The Romans also (as may be gathered from Varro's *De Re Rustica*) called the feminine pudenda *porcus*.

[52] Schurig, *Gynaecologia*, pp. 280-387; Bloch, *op. cit.*, 270-277. The Arabs, according to Kocher, chiefly practice bestiality with goats, sheep and mares. The Annamites, according to Mondiere, commonly employ sows and (more especially the young women) dogs. Among the Tamils of Ceylon bestiality with goats and cows is said to be very prevalent.

[53] Mantegazza (*Gli Amori degli Uomini*, cap. V) brings together some facts bearing on this matter.

V.

Exhibitionism--Illustrative Cases--A Symbolic Perversion of Courtship--The Impulse to Defile--The Exhibitionist's Psychic Attitude--The Sexual Organs as Fetichs--Phallus Worship--Adolescent Pride in Sexual Development--Exhibitionism of the Nates--The Classification of the Forms of Exhibitionism--Nature of the Relationship of Exhibitionism to Epilepsy.

There is a remarkable form of erotic symbolism--very definite and standing clearly apart from all other forms--in which sexual gratification is experienced in the simple act of exhibiting the sexual organ to persons of the opposite sex, usually by preference to young and presumably innocent persons, very often children. This is termed exhibitionism.[54] It would appear to be a not very infrequent phenomenon, and most women, once or more in their lives, especially when young, have encountered a man who has thus deliberately exposed himself before them.

The exhibitionist, though often a young and apparently vigorous man, is always satisfied with the mere act of self-exhibition and the emotional reaction which that act produces; he makes no demands on the woman to whom he exposes himself; he seldom speaks, he makes no effort to approach her;

as a rule, he fails even to display the signs of sexual excitation. His desires are completely gratified by the act of exhibition and by the emotional reaction it arouses in the woman. He departs satisfied and relieved.

A case recorded by Schrenck-Notzing very well represents both the nature of the impulse felt by the exhibitionist and the way in which it may originate. It is the case of a business man of 49, of neurotic heredity, an affectionate husband and father of a family, who, to his own grief and shame, is compelled from time to time to exhibit his sexual organs to women in the street. As a boy of 10 a girl of 12 tried to induce him to coitus; both had their sexual parts exposed. From that time sexual contacts, as of his own naked nates against those of a girl, became attractive, as well as games in which the boys and girls in turn marched before each other with their sexual parts exposed, and also imitation of the copulation of animals. Coitus was first practiced about the age of 20, but sight and touch of the woman's sexual parts were always necessary to produce sexual excitement. It was also necessary--and this consideration is highly important as regards the development of the tendency to exhibition--that the woman should be excited by the sight of his organs. Even when he saw or touched a woman's parts orgasm often occurred. It was the naked sexual organs in an otherwise clothed body which chiefly excited him. He was not possessed of a high degree of potency. Girls between the ages of 10 and 17 chiefly excited him, and especially if he felt that they were quite ignorant of sexual matters. His self-exhibition was a sort of psychic defloration, and it was accompanied by the idea that other people felt as he did about the sexual effects of the naked organs, that he was shocking but at the same time sexually exciting a young girl. He was thus gratifying himself through the belief that he was causing sexual gratification to an innocent girl. This man was convicted several times, and was finally declared to be suffering from impulsive insanity. (Schrenck-Notzing, *_Kriminal-psychologische und Psycho-pathologische Studien_*, 1902, pp. 50-57.) In another case of Schrenck-Notzing's, an actor and portrait painter, aged 31, in youth masturbated and was fond of contemplating the images of the sexual organs of both sexes, finding little pleasure in coitus. At the age of 24, at a bathing establishment, he happened to occupy a compartment next to that occupied by a lady, and when naked he became aware that his

neighbor was watching him through a chink in the partition. This caused him powerful excitement and he was obliged to masturbate. Ever since he has had an impulse to exhibit his organs and to masturbate in the presence of women. He believes that the sight of his organs excites the woman (Ib., pp. 57-68). The presence of masturbation in this case renders it untypical as a case of exhibitionism. Moll at one time went so far as to assert that when masturbation takes place we are not entitled to admit exhibitionism, (*Untersuchungen ueber die Libido Sexualis*, bd. i, p. 661), but now accepts exhibitionism with masturbation ("Perverse Sexualempfindung," *Krankheiten und Ehe*). The act of exhibition itself gratifies the sexual impulse, and usually it suffices to replace both tumescence and detumescence.

A fairly typical case, recorded by Krafft-Ebing, is that of a German factory worker of 37, a good, sober and intelligent workman. His parents were healthy, but one of his mother's and also one of his father's sisters were insane; some of his relatives are eccentric in religion. He has a languishing expression and a smile of self-complacency. He never had any severe illness, but has always been eccentric and imaginative, much absorbed in romances (such as Dumas's novels) and fond of identifying himself with their heroes. No signs of epilepsy. In youth moderate masturbation, later moderate coitus. He lives a retired life, but is fond of elegant dress and of ornament. Though not a drinker, he sometimes makes himself a kind of punch which has a sexually exciting effect on him. The impulse to exhibitionism has only developed in recent years. When the impulse is upon him he becomes hot, his heart beats violently, the blood rushes to his head, and he is oblivious of everything around him that is not connected with his own act. Afterwards he regards himself as a fool and makes vain resolutions never to repeat the act. In exhibition the penis is only half erect and ejaculation never occurs. (He is only capable of coitus with a woman who shows great attraction to him.) He is satisfied with self-exhibition, and believes that he thus gives pleasure to the woman, since he himself receives pleasure in contemplating a woman's sexual parts. His erotic dreams are of self-exhibition to young and voluptuous women. He had been previously punished for an offense of this kind; medico-legal opinion now recognized the incriminated man's psychopathic condition. (Krafft-Ebing, *Op. cit.*, pp. 492-494.)

Trochon has reported the case of a married man of 33, a worker in a factory, who for several years had exhibited himself at intervals to shop-girls, etc., in a state of erection, but without speaking or making other advances. He was a hard-working, honest, sober man of quiet habits, a good father to his family and happy at home. He showed not the slightest sign of insanity. But he was taciturn, melancholic and nervous; a sister was an idiot. He was arrested, but on the report of the experts that he committed these acts from a morbid impulse he could not control he was released. (Trochon, *_Archives de l'Anthropologie Criminelle_*, 1888, p. 256.)

In a case of Freyer's (*_Zeitschrift fuer Medizinalbeamte_*, third year, No. 8) the occasional connection of exhibitionism with epilepsy is well illustrated by a barber's assistant, aged 35, whose father suffered from chronic alcoholism and was also said to have committed the same kind of offense as his son. The mother and a sister suffered nervously. From ages of 7 to 18 the subject had epileptic convulsions. From 16 to 21 he indulged in normal sexual intercourse. At about that time he had often to pass a playground and at times would urinate there; it happened that the children watched him with curiosity. He noticed that when thus watched sexual excitement was caused, inducing erection and even ejaculation. He gradually found pleasure in this kind of sexual gratification; finally he became indifferent to coitus. His erotic dreams, though still usually about normal coitus, were now sometimes concerned with exhibition before little girls. When overcome by the impulse he could see and hear nothing around him, though he did not lose consciousness. After the act was over he was troubled by his deed. In all other respects he was entirely reasonable. He was imprisoned many times for exhibiting himself to young schoolgirls, sometimes vaunting the beauty of his organs and inviting inspection. On one occasion he underwent mental examination, but was considered to be mentally sound. He was finally held to be a hereditarily tainted individual with neuropathic constitution. The head was abnormally broad, penis small, patellar reflex absent, and there were many signs of neurasthenia. (Krafft-Ebing, *_Op. cit._*, pp. 490-492.)

The prevalence of epilepsy among exhibitionists is shown by the observations of Pelanda in Verona. He has recorded six cases of

this perversion, all of which eventually reached the asylum and were either epileptics or with epileptic relations. One had a brother who was also an exhibitionist. In some cases the penis was abnormally large, in others abnormally small. Several had very weak sexual impulse; one, at the age of 62, had never effected coitus, and was proud of the fact that he was still a virgin, considering, he would say, the epoch of demoralization in which we live. (Pelanda, "Pornopatici," _Archivio di Psichiatria_, fasc. ii-iv, 1889.)

In a very typical case of exhibitionism which Garnier has recorded, a certain X., a gentleman engaged in business in Paris, had a predilection for exhibiting himself in churches, more especially in Saint-Roch. He was arrested several times for exposing his sexual organs here before ladies in prayer. In this way he finally ruined his commercial position in Paris and was obliged to establish himself in a small provincial town. Here again he soon exposed himself in a church and was again sent to prison, but on his liberation immediately performed the same act in the same church in what was described as a most imperturbable manner. Compelled to leave the town, he returned to Paris, and in a few weeks' time was again arrested for repeating his old offense in Saint Roch. When examined by Garnier, the information he supplied was vague and incomplete, and he was very embarrassed in the attempt to explain himself. He was unable to say why he chose a church, but he felt that it was to a church that he must go. He had, however, no thought of profanation and no wish to give offense. "Quite the contrary!" he declared. He had the sad and tired air of a man who is dominated by a force stronger than his will. "I know," he added, "what repulsion my conduct must inspire. Why am I made thus? Who will cure me?" (P. Garnier, "Perversions Sexuelles," _Comptes Rendus_, International Congress of Medicine at Paris in 1900, _Section de Psychiatrie_, pp. 433-435.)

In some cases, it would appear, the impulse to exhibitionism may be overcome or may pass away. This result is the more likely to come about in those cases in which exhibitionism has been largely conditioned by chronic alcoholism or other influences tending to destroy the inhibiting and restraining action of the higher centers, which may be overcome by hygiene and treatment. In this connection I may bring forward a case which has been communicated

to me by a medical correspondent in London. It is that of an actor, of high standing in his profession and extremely intelligent, 49 years of age, married and father of a large family. He is sexually vigorous and of erotic temperament. His general health has always been good, but he is a high-strung, neurotic man, with quick mental reactions. His habits had for a long time been decidedly alcoholic, but two years ago, a small quantity of albumen being found in the urine, he was persuaded to leave off alcohol, and has since been a teetotaler. Though ordinarily very reticent about sexual matters, he began four or five years ago to commit acts of exhibitionism, exposing himself to servants in the house and occasionally to women in the country. This continued after the alcohol had been abandoned and lasted for several years, though the attention of the police was never attracted to the matter, and so far as possible he was quietly supervised by his friends. Nine months after, the acts of exhibitionism ceased, apparently in a spontaneous manner, and there has so far been no relapse.

Exhibitionism is an act which, on the face of it, seems nonsensical and meaningless, and as such, as an inexplicable act of madness, it has frequently been treated both by writers on insanity and on sexual perversion. "These acts are so lacking in common sense and intelligent reflection that no other reason than insanity can be offered for the patient," Ball concluded.[55] Moll, also, who defines exhibitionism somewhat too narrowly as a condition in which "the charm of the exhibition lies for the subject in the display itself," not sufficiently taking into consideration the imagined effect on the spectator, concludes that "the psychological basis of exhibitionism is at present by no means cleared up." [56]

We may probably best approach exhibitionism by regarding it as fundamentally a symbolic act based on a perversion of courtship. The exhibitionist displays the organ of sex to a feminine witness, and in the shock of modest sexual shame by which she reacts to that spectacle, he finds a gratifying similitude of the normal emotions of coitus.[57] He feels that he has effected a psychic defloration.

Exhibitionism is thus analogous, and, indeed, related, to the impulse felt by many persons to perform indecorous acts or tell indecent stories before young and innocent persons of the opposite sex. This is a kind of psychic exhibitionism, the

gratification it causes lying exactly, as in physical exhibitionism, in the emotional confusion which it is felt to arouse. The two kinds of exhibitionism may be combined in the same person: Thus, in a case reported by Hoche (p. 97), the exhibitionist an intellectual and highly educated man, with a doctor's degree, also found pleasure in sending indecent poems and pictures to women, whom, however, he made no attempt to seduce; he was content with the thought of the emotions he aroused or believed that he aroused.

It is possible that within this group should come the agent in the following incident which was lately observed by a lady, a friend of my own. An elderly man in an overcoat was seen standing outside a large and well-known draper's shop in the outskirts of London; when able to attract the attention of any of the shop-girls or of any girl in the street he would fling back his coat and reveal that he was wearing over his own clothes a woman's chemise (or possibly bodice) and a woman's drawers; there was no exposure. The only intelligible explanation of this action would seem to be that pleasure was experienced in the mild shock of interested surprise and injured modesty which this vision was imagined to cause to a young girl. It would thus be a comparatively innocent form of psychic defloration.

It is of interest to point out that the sexual symbolism of active flagellation is very closely analogous to this symbolism of exhibitionism. The flagellant approaches a woman with the rod (itself a symbol of the penis and in some countries bearing names which are also applied to that organ) and inflicts on an intimate part of her body the signs of blushing and the spasmodic movements which are associated with sexual excitement, while at the same time she feels, or the flagellant imagines that she feels, the corresponding emotions of delicious shame.[58] This is an even closer mimicry of the sexual act than the exhibitionist attains, for the latter fails to secure the consent of the woman nor does he enjoy any intimate contact with her naked body. The difference is connected with the fact that the active flagellant is usually a more virile and normal person than the exhibitionist. In the majority of cases the exhibitionist's sexual impulse is very feeble, and as a rule he is either to some degree a degenerate, or else a person who is suffering from an early stage of general paralysis, dementia, or some other highly enfeebling cause of mental disorganization, such as chronic alcoholism. Sexual feebleness is further indicated by the fact that the individuals selected as witnesses

are frequently mere children.

It seems probable that a form of erotic symbolism somewhat similar to exhibitionism is to be found in the rare cases in which sexual gratification is derived from throwing ink, acid or other defiling liquids on women's dresses. Thoinot has recorded a case of this kind (*_Attentats aux Moeurs_*, 1898, pp. 484, *_et seq._*). An instructive case has been presented by Moll. In this case a young man of somewhat neuropathic heredity had as a youth of 16 or 17, when romping with his young sister's playfellows, experienced sexual sensations on chancing to see their white underlinen. From that time white underlinen and white dresses became to him a fetich and he was only attracted to women so attired. One day, at the age of 25, when crossing the street in wet weather with a young lady in a white dress, a passing vehicle splashed the dress with mud. This incident caused him strong sexual excitement, and from that time he had the impulse to throw ink, perchloride of iron, etc., on to ladies' white dresses, and sometimes to cut and tear them, sexual excitement and ejaculation taking place every time he effected this. (Moll, "Gutachten ueber einem Sexual Perversen [Besudelungstrieb]," *_Zeitschrift fuer Medizinalbeamte_*, Heft XIII, 1900). Such a case is of considerable psychological interest. Thoinot considers that in these cases the fleck is a fetich. That is an incorrect account of the matter. In this case the white garments constituted the primary fetich, but that fetich becomes more acutely realized, and at the same time both parties are thrown into an emotional state which to the fetichist becomes a mimicry of coitus, by the act of defilement. We may perhaps connect with this phenomenon the attraction which muddy shoes often exert over the shoe-fetichist, and the curious way in which, as we have seen (p. 18), Restif de la Bretonne associates his love of neatness in women with his attraction to the feet, the part, he remarks, least easy to keep clean.

Garnier applied the term *_sadi-fetichism_* to active flagellation and many similar manifestations such as we are here concerned with, on the grounds that they are hybrids which combine the morbid adoration for a definite object with the impulse to exercise a more or less degree of violence. From the standpoint of the conception of erotic symbolism I have adopted there is no need for this term. There is here no hybrid combination of two

unlike mental states. We are simply concerned with states of erotic symbolism, more or less complete, more or less complex.

The conception of exhibitionism as a process of erotic symbolism, involves a conscious or unconscious attitude of attention in the exhibitionist's mind to the psychic reaction of the woman toward whom his display is directed. He seeks to cause an emotion which, probably in most cases, he desires should be pleasurable. But from one cause or another his finer sensibilities are always inhibited or in abeyance, and he is unable to estimate accurately either the impression he is likely to produce or the general results of his action, or else he is moved by a strong impulsive obsession which overpowers his judgment. In many cases he has good reason for believing that his act will be pleasurable, and frequently he finds complacent witnesses among the low-class servant girls, etc.

It may be pointed out here that we are quite justified in speaking of a penis-fetichism and also of a vulva-fetichism. This might be questioned. We are obviously justified in recognizing a fetichism which attaches itself to the pubic hair, or, as in a case with which I am acquainted, to the clitoris, but it may seem that we cannot regard the central sexual organs as symbols of sex, symbols, as it were, of themselves. Properly regarded, however, it is the sexual act rather than the sexual organ which is craved in normal sexual desire; the organ is regarded merely as the means and not as the end. Regarded as a means the organ is indeed an object of desire, but it only becomes a fetich when it arrests and fixes the attention. An attention thus pleasurably fixed, a vulva-fetichism or a penis-fetichism, is within the normal range of sexual emotion (this point has been mentioned in the previous volume when discussing the part played by the primary sexual organs in sexual selection), and in coarse-grained natures of either sex it is a normal allurement in its generalized shape, apart from any attraction to the person to whom the organs belong. In some morbid cases, however, this penis-fetichism may become a fully developed sexual perversion. A typical case of this kind has been recorded by Howard in the United States. Mrs. W., aged 39, was married at 20 to a strong, healthy man, but derived no pleasure from coitus, though she received great pleasure from masturbation practiced immediately after coitus, and nine years after marriage she ceased actual coitus, compelling her husband to adopt mutual masturbation. She would introduce men into the house at all times of the day or

night, and after persuading them to expose their persons would retire to her room to masturbate. The same man never aroused desire more than once. This desire became so violent and persistent that she would seek out men in all sorts of public places and, having induced them to expose themselves, rapidly retreat to the nearest convenient spot for self-gratification. She once abstracted a pair of trousers she had seen a man wear and after fondling them experienced the orgasm. Her husband finally left her, after vainly attempting to have her confined in an asylum. She was often arrested for her actions, but through the intervention of friends set free again. She was a highly intelligent woman, and apart from this perversion entirely normal. (W.L. Howard, "Sexual Perversion," Alienist and Neurologist, January, 1896.) It is on the existence of a more or less developed penis-fetichism of this kind that the exhibitionist, mostly by an ignorant instinct, relies for the effects he desires to produce.

The exhibitionist is not usually content to produce a mere titillated amusement; he seeks to produce a more powerful effect which must be emotional whether or not it is pleasurable. A professional man in Strassburg (in a case reported by Hoche[59]) would walk about in the evening in a long cloak, and when he met ladies would suddenly throw his cloak back under a street lamp, or igniting a red-fire match, and thus exhibit his organs. There was an evident effort--on the part of a weak, vain, and effeminate man--to produce a maximum of emotional effect. The attempt to heighten the emotional shock is also seen in the fact that the exhibitionist frequently chooses a church as the scene of his exploits, not during service, for he always avoids a concourse of people, but perhaps toward evening when there are only a few kneeling women scattered through the edifice. The church is chosen, often instinctively rather than deliberately, from no impulse to commit a sacrilegious outrage--which, as a rule, the exhibitionist does not feel his act to be--but because it really presents the conditions most favorable to the act and the effects desired. The exhibitionist's attitude of mind is well illustrated by one of Garnier's patients who declared that he never wished to be seen by more than two women at once, "just what is necessary," he added, "for an exchange of impressions." After each exhibition he would ask himself anxiously: "Did they see me? What are they thinking? What do they say to each other about me? Oh! how I should like to know!" Another patient of Garnier's, who haunted churches for this purpose, made this very significant statement: "Why do I like going to churches? I can scarcely

say. _But I know that it is only there that my act has its full importance_. The woman is in a devout frame of mind, and she must see that such an act in such a place is not a joke in bad taste or a disgusting obscenity; _that if I go there it is not to amuse myself; it is more serious than that!_ I watch the effect produced on the faces of the ladies to whom I show my organs. I wish to see them express a profound joy. I wish, in fact, that they may be forced to say to themselves: _How impressive Nature is when thus seen!_"

Here we trace the presence of a feeling which recalls the phenomena of the ancient and world-wide phallic worship, still liable to reappear sporadically. Women sometimes took part in these rites, and the osculation of the male sexual organ or its emblematic representation by women is easily traceable in the phallic rites of India and many other lands, not excluding Europe even in comparatively recent times. (Dulaure in his *_Divinites Generatrices_* brings together much bearing on these points; cf.: Ploss and Bartels, *_Das Weib_*, vol. i, Chapter XVII, and Bloch, *_Beitraege zur Psychopathia Sexualis_*, Teil I, pp. 115-117. Colin Scott has some interesting remarks on phallic worship and the part it has played in aiding human evolution, "Sex and Art," *_American Journal of Psychology_*, vol. vii, No. 2, pp. 191-197. Irving Rosse describes some modern phallic rites in which both men and women took part, similar to those practiced in vaudouism, "Sexual Hypochondriasis," *_Virginia Medical Monthly_*, October, 1892.)

Putting aside any question of phallic worship, a certain pride and more or less private feeling of ostentation in the new expansion and development of the organs of virility seems to be almost normal at adolescence. "We have much reason to assume," Stanley Hall remarks, "that in a state of nature there is a certain instinctive pride and ostentation that accompanies the new local development. I think it will be found that exhibitionists are usually those who have excessive growth here, and that much that modern society stigmatizes as obscene is at bottom more or less spontaneous and perhaps in some cases not abnormal. Dr. Seerley tells me he has never examined a young man largely developed who had the usual strong instinctive tendency of modesty to cover himself with his hands, but he finds this instinct general with those whose development is less than the average." (G. Stanley Hall, *_Adolescence_*, vol. ii, p. 97.) This

instinct of ostentation, however, so far as it is normal, is held in check by other considerations, and is not, in the strict sense, exhibitionism. I have observed a full-grown telegraph boy walking across Hampstead Heath with his sexual organs exposed, but immediately he realized that he was seen he concealed them. The solemnity of exhibitionism at this age finds expression in the climax of the sonnet, "Oraison du Soir," written at 16 by Rimbaud, whose verse generally is a splendid and insolent manifestation of rank adolescence:--

"Doux comme le Seigneur du cedre et des hysopes,
Je pisse vers les cieux bruns tres haut et tres loin,
Avec l'assentiment des grands heliotropes."

(J.A. Rimbaud, *Oeuvres*, p. 68.)

In women, also, there would appear to be traceable a somewhat similar ostentation, though in them it is complicated and largely inhibited by modesty, and at the same time diffused over the body owing to the absence of external sexual organs. "Primitive woman," remarks Madame Renooz, "proud of her womanhood, for a long time defended her nakedness which ancient art has always represented. And in the actual life of the young girl to-day there is a moment when by a secret atavism she feels the pride of her sex, the intuition of her moral superiority, and cannot understand why she must hide its cause. At this moment, wavering between the laws of Nature and social conventions, she scarcely knows if nakedness should or should not affright her. A sort of confused atavistic memory recalls to her a period before clothing was known, and reveals to her as a paradisaical ideal the customs of that human epoch." (Celine Renooz, *Psychologie Comparee de l'Homme et de la Femme*, p. 85.) It may be added that among primitive peoples, and even among some remote European populations to-day, the exhibition of feminine nudity has sometimes been regarded as a spectacle with religious or magic operation. (Ploss, *Das Weib*, seventh edition, vol. ii, pp. 663-680; Havelock Ellis, *Man and Woman*, fourth edition, p. 304.) It is stated by Gopcevic that in the long struggle between the Albanians and the Montenegrins the women of the former people would stand in the front rank and expose themselves by raising their skirts, believing that they would thus insure victory. As, however, they were shot down, and as, moreover,

victory usually fell to the Montenegrrians, this custom became discredited. (Quoted by Bloch, *_Op. cit._*, Teil II, p. 307.)

With regard to the association, suggested by Stanley Hall, between exhibitionism and an unusual degree of development of the sexual organs, it must be remarked that both extremes--a very large and a very small penis--are specially common in exhibitionists. The prevalence of the small organ is due to an association of exhibitionism with sexual feebleness. The prevalence of the large organ may be due to the cause suggested by Hall. Among Mahommedans the sexual organs are sometimes habitually exposed by religious penitents, and I note that Bernhard Stern, in his book on the medical and sexual aspects of life in Turkey, referring to a penitent of this sort whom he saw on the Stamboul bridge at Constantinople, remarks that the organ was very largely developed. It may well be in such a case that the penitent's religious attitude is reinforced by some lingering relic of a more fleshly ostentation.

It is by a pseudo-atavism that this phallicism is evoked in the exhibitionist. There is no true emergence of an ancestrally inherited instinct, but by the paralysis or inhibition of the finer and higher feelings current in civilization, the exhibitionist is placed on the same mental level as the man of a more primitive age, and he thus presents the basis on which the impulses belonging to a higher culture may naturally take root and develop.

Reference may here be made to a form of primitive exhibitionism, almost confined to women, which, although certainly symbolic, is absolutely non-sexual, and must not, therefore, be confused with the phenomena we are here occupied with. I refer to the exhibition of the buttocks as a mark of contempt. In its most primitive form, no doubt, this exhibitionism is a kind of exorcism, a method of putting evil spirits, primarily, and secondarily evil-disposed persons, to flight. It is the most effective way for a woman to display sexual centers, and it shares in the magical virtues which all unveiling of the sexual centers is believed by primitive peoples to possess. It is recorded that the women of some peoples in the Balkan peninsula formerly used this gesture against enemies in battle. In the sixteenth century so distinguished a theologian as Luther when assailed by the Evil One at night was able to put the adversary

to flight by protruding his uncovered buttocks from the bed. But the spiritual significance of this attitude is lost with the decay of primitive beliefs. It survives, but merely as a gesture of insult. The symbolism comes to have reference to the nates as the excretory focus, the seat of the anus. In any case it ignores any sexual attractiveness in this part of the body. Exhibitionism of this kind, therefore, can scarcely arise in persons of any sensitiveness or aesthetic perception, even putting aside the question of modesty, and there seems to be little trace of it in classic antiquity when the nates were regarded as objects of beauty. Among the Egyptians, however, we gather from Herodotus (Bk. II, Chapter LX) that at a certain popular religious festival men and women would go in boats on the Nile, singing and playing, and when they approached a town the women on the boats would insult the women of the town by injurious language and by exposing themselves. Among the Arabs, however, the specific gesture we are concerned with is noted, and a man to whom vengeance is forbidden would express his feelings by exposing his posterior and strewing earth on his head (Wellhausen, *Rests Arabischen Heidentums*, 1897, p. 195). It is in Europe and in mediaeval and later times that this emphatic gesture seems to have flourished as a violent method of expressing contempt. It was by no means confined to the lower classes, and Kleinpaul, in discussing this form of "speech without words," quotes examples of various noble persons, even princesses, who are recorded thus to have expressed their feelings. (Kleinpaul, *Sprache ohne Worte*, pp. 271-273.) In more recent times the gesture has become merely a rare and extreme expression of unrestrained feeling in coarse-grained peasants. Zola, in the figure of Mouquette in *Germinal*, may be said to have given a kind of classic expression to the gesture. In the more remote parts of Europe it appears to be still not altogether uncommon. This seems to be notably the case among the South Slavs, and Krauss states that "when a South Slav woman wishes to express her deepest contempt for anyone she bends forward, with left hand raising her skirts, and with the right slapping her posterior, at the same time exclaiming: 'This for you!'" (Kryptadia, vol. vi, p. 200.)

A verbal survival of this gesture, consisting in the contemptuous invitation to kiss this region, still exists among us in remote parts of the country, especially as an insult offered by an angry woman who forgets herself. It is said to be commonly used in

Wales. ("Welsh AEdoelogy," Kryptadia, vol. ii, pp. 358, et seq.) In Cornwall, when addressed by a woman to a man it is sometimes regarded as a deadly insult, even if the woman is young and attractive, and may cause a life-long enmity between related families. From this point of view the nates are a symbol of contempt, and any sexual significance is excluded. (The distinction is brought out by Diderot in *Le Neveu de Rameau*:
Lui:--Il y a d'autres jours ou il ne m'en coûterait rien pour être vil tant qu'on voudrait; ces jours-la, pour un liard, je baiserais le cul à la petite Hus. _Moi:_--Eh! mais, l'ami, elle est blanche, jolie, douce, potelée, et c'est un acte d'humilité auquel un plus délicat que vous pourrait quelquefois s'abaisser. _Lui:_--Entendons-nous; c'est qu'il y a baiser le cul au simple, et baiser le cul au figure.")

It must be added that a sexual form of exhibitionism of the nates must still be recognized. It occurs in masochism and expresses the desire for passive flagellation. Rousseau, whose emotional life was profoundly affected by the castigations which as a child he received from Mlle Lambercier, has in his *Confessions* told us how, when a youth, he would sometimes expose himself in this way in the presence of young women. Such masochistic exhibitionism seems, however, to be rare.

While the manifestations of exhibitionism are substantially the same in all cases, there are many degrees and varieties of the condition. We may find among exhibitionists, as Garnier remarks, dementia, states of unconsciousness, epilepsy, general paralysis, alcoholism, but the most typical cases, he adds, if not indeed the cases to which the term properly belongs, are those in which it is an impulsive obsession. Krafft-Ebing[60] divides exhibitionists into four clinical groups: (1) acquired states of mental weakness, with cerebral or spinal disease clouding consciousness and at the same time causing impotence; (2) epileptics, in whom the act is an abnormal organic impulse performed in a state of imperfect consciousness; (3) a somewhat allied group of neurasthenic cases; (4) periodical impulsive cases with deep hereditary taint. This classification is not altogether satisfactory. Garnier's classification, placing the group of obsessional cases in the foreground and leaving the other more vaguely defined groups in the background, is probably better. I am inclined to consider that most of the cases fall into one or other of two mixed groups. The first class includes cases in which there is more or less congenital abnormality, but otherwise a fair or even complete degree

of mental integrity; they are usually young adults, they are more or less precisely conscious of the end they wish to attain, and it is often only with a severe struggle that they yield to their impulses. In the second class the beginnings of mental or nervous disease have diminished the sensibility of the higher centers; the subjects are usually old men whose lives have been absolutely correct; they are often only vaguely aware of the nature of the satisfaction they are seeking, and frequently no struggle precedes the manifestation; such was the case of the overworked clergyman described by Hughes,[61] who, after much study, became morose and absent-minded, and committed acts of exhibitionism which he could not explain but made no attempt to deny; with rest and restorative treatment his health improved and the acts ceased. It is in the first class of cases alone that there is a developed sexual perversion. In the cases of the second class there is a more or less definite sexual intention, but it is only just conscious, and the emergence of the impulse is due not to its strength but to the weakness, temporary or permanent, of the higher inhibiting centers.

Epileptic cases, with loss of consciousness during the act, can only be regarded as presenting a pseudo-exhibitionism. They should be excluded altogether. It is undoubtedly true that many cases of real or apparent exhibitionism occur in epileptics.[62] We must not, however, too hastily conclude that because these acts occur in epileptics they are necessarily unconscious acts. Epilepsy frequently occurs on a basis of hereditary degeneration, and the exhibitionism may be, and not infrequently is, a stigma of the degeneracy and not an indication of the occurrence of a minor epileptic fit. When the act of pseudo-exhibitionism is truly epileptic, it will usually have no psychic sexual content, and it will certainly be liable to occur under all sorts of circumstances, when the patient is alone or in a miscellaneous concourse of people. It will be on a level with the acts of the highly respectable young woman who, at the conclusion of an attack of *_petit mal_*, consisting chiefly of a sudden desire to pass urine, on one occasion lifted up her clothes and urinated at a public entertainment, so that it was with difficulty her friends prevented her from being handed over to the police.[63] Such an act is automatic, unconscious, and involuntary; the spectators are not even perceived; it cannot be an act of exhibitionism. Whenever, on the other hand, the place and the time are evidently chosen deliberately,--a quiet spot, the presence of only one or two young women or children,--it is difficult to admit that we are in the presence of a fit of epileptic unconsciousness, even when the subject is known to be epileptic.

Even, however, when we exclude those epileptic pseudo-exhibitionists who, from the legal point of view, are clearly irresponsible, it must still be remembered that in every case of exhibitionism there is a high degree of either mental abnormality on a neuropathic basis, or else of actual disease. This is true to a greater extent in exhibitionism than in almost any other form of sexual perversion. No subject of exhibitionism should be sent to prison without expert medical examination.

FOOTNOTES:

[54] Lasege first drew attention to this sexual perversion and gave it its generally accepted name, "Les Exhibitionistes," *L'Union Medicale*, May, 1877. Magnan, on various occasions (for example, "Les Exhibitionistes," *Archives de l'Anthropologie Criminelle*, vol. v, 1890, p. 456), has given further development and precision to the clinical picture of the exhibitionist.

[56] Moll, *Untersuchungen ueber die Libido Sexualis*, bd. i, p. 661.

[57] "Exhibitionism in its most typical form is," Garnier truly says, "a *systematic act*, manifesting itself as the *strange equivalent* of a sexual connection, or its *substitution*." The brief account of exhibitionism (pp. 433-437) in Garnier's discussion of "Perversions Sexuelles" at the International Medical Congress at Paris in 1900 (*Section de Psychiatrie: Comptes-Rendus*) is the most satisfactory statement of the psychological aspects of this perversion with which I am acquainted. Garnier's unrivalled clinical knowledge of these manifestations, due to his position during many years as physician at the Depot of the Prefecture of Police in Paris, adds great weight to his conclusions.

[58] The symbolism of coitus involved in flagellation has been touched on by Eulenburg (*Sexuale Neuropathie*, p. 121), and is more fully developed by Duehren (*Geschlechtsleben in England*, bd. ii, pp. 366, *et seq.*).

VI.

The Forms of Erotic Symbolism are Simulacra of Coitus--Wide Extension of Erotic Symbolism--Fetichism Not Covering the Whole Ground of Sexual Selection--It is Based on the Individual Factor in Selection--Crystallization--The Lover and the Artist--The Key to Erotic Symbolism to be Found in the Emotional Sphere--The Passage to Pathological Extremes.

We have now examined several very various and yet very typical manifestations in all of which it is not difficult to see how, in some strange and eccentric form--on a basis of association through resemblance or contiguity or both combined--there arises a definite mimicry of the normal sexual act together with the normal emotions which accompany that act. It has become clear in what sense we are justified in recognizing erotic symbolism.

The symbolic and, as it were, abstracted nature of these manifestations is shown by the remarkable way in which they are sometimes capable of transference from the object to the subject. That is to say that the fetichist may show a tendency to cultivate his fetich in his own person. A foot-fetichist may like to go barefoot himself; a man who admired lame women liked to halt himself; a man who was attracted by small waists in women found sexual gratification in tight-lacing himself; a man who was fascinated by fine white skin and wished to cut it found satisfaction in cutting his own skin; Moll's coprolagnic

fetichist found a voluptuous pleasure in his own acts of defecation. (See, e.g., Krafft-Ebing, *_Op. cit._*, p. 221, 224, 226; Hammond, *_Sexual Impotence_*, p. 74; cf. *_ante_*, p. 68.) Such symbolic transference seems to have a profoundly natural basis, for we may see a somewhat similar phenomenon in the well-known tendency of cows to mount a cow in heat. This would appear to be, not so much a homosexual impulse, as the dynamic psychic action of an olfactory sexual symbol in a transformed form.

We seem to have here a psychic process which is a curious reversal of that process of *_Einfuehlung_*--the projection of one's own activities into the object contemplated--which Lipps has so fruitfully developed as the essence of every aesthetic condition. (T. Lipps, *_AEsthetik_*, Teil I, 1903.) By *_Einfuehlung_* our own interior activity becomes the activity of the object perceived, a thing being beautiful in proportion as it lends itself to our *_Einfuehlung_*. But by this action of erotic symbolism, on the other hand, we transfer the activity of the object into ourselves.

When the idea of erotic symbolism as manifested in such definite and typical forms becomes realized, it further becomes clear that the vaguer manifestations of such symbolism are exceedingly widespread. When in a previous volume we were discussing and drawing together the various threads which unite "Love and Pain," it will now be understood that we were standing throughout on the threshold of erotic symbolism. Pain itself, in the sense in which we slowly learned to define it in this relationship--as a state of intense emotional excitement--may, under a great variety of special circumstances, become an erotic symbol and afford the same relief as the emotions normally accompanying the sexual act. Active algolagnia or sadism is thus a form of erotic symbolism; passive algolagnia or masochism is (in a man) an inverted form of erotic symbolism. Active flagellation or passive flagellation are, in exactly the same way, manifestations of erotic symbolism, the imaginative mimicry of coitus.

Binet and also Krafft-Ebing[64] have argued in effect that the whole of sexual selection is a matter of fetichism, that is to say, of erotic symbolism of object. "Normal love," Binet states, "appears as the result of a complicated fetichism." Tarde also seems to have regarded love as normally a kind of fetichism. "We are a long time before we fall in love with a woman," he remarks; "we must wait to see the detail which strikes

and delights us, and causes us to overlook what displeases us. Only in normal love the details are many and always changing. Constancy in love is rarely anything else but a voyage around the beloved person, a voyage of exploration and ever new discoveries. The most faithful lover does not love the same woman in the same way for two days in succession."[65]

From that point of view normal sexual love is the sway of a fetich--more or less arbitrary, more or less (as Binet terms it) polytheistic--and it can have little objective basis. But, as we saw when considering "Sexual Selection in Man" in the previous volume, more especially when analyzing the notion of beauty, we are justified in believing that beauty has to a large extent an objective basis, and that love by no means depends simply on the capricious selection of some individual fetich. The individual factor, as we saw, is but one of many factors which constitute beauty. In the study of sexual selection that individual factor was passed over very lightly. We now see that it is often a factor of great importance, for in it are rooted all these outgrowths--normal in their germs, highly abnormal in their more extreme developments--which make up erotic symbolism.

Erotic symbolism is therefore concerned with all that is least generic, least specific, all that is most intimately personal and individual, in sexual selection. It is the final point in which the decreasing circle of sexual attractiveness is fixed. In the widest and most abstract form sexual selection in man is merely human, and we are attracted to that which bears most fully the marks of humanity; in a less abstract form it is sexual, and we are attracted to that which most vigorously presents the secondary sexual characteristics; still narrowing, it is the type of our own nation and people that appeals most strongly to us in matters of love; and still further concentrating we are affected by the ideal--in civilization most often the somewhat exotic ideal--of our own day, the fashion of our own city. But the individual factor still remains, and amid the infinite possibilities of erotic symbolism the individual may evolve an ideal which is often, as far as he knows and perhaps in actuality, an absolutely unique event in the history of the human soul.

Erotic symbolism works in its finer manifestations by means of the idealizing aptitudes; it is the field of sexual psychology in which that faculty of crystallization, on which Stendhal loved to dwell, achieves its most brilliant results. In the solitary passage in which we seem to see a smile on the face of the austere poet of the *De Rerum Natura*, Lucretius tells us how every lover, however he may be amused by the amorous extravagances of other men, is himself blinded by passion: if his mistress

is black she is a fascinating brunette, if she squints she is the rival of Pallas, if too tall she is majestic, if too short she is one of the Graces, *_tota merum sal_*; if too lean it is her delicate refinement, if too fat then a Ceres, dirty and she disdains adornment, a chatterer and brilliantly vivacious, silent and it is her exquisite modesty.[66] Sixteen hundred years later Robert Burton, when describing the symptoms of love, made out a long and appalling list of the physical defects which the lover is prepared to admire.[67]

Yet we must not be too certain that the lover is wrong in this matter. We too hastily assume that the casual and hasty judgment of the world is necessarily more reliable, more conformed to what we call "truth," than the judgment of the lover which is founded on absorbed and patient study. In some cases where there is lack of intelligence in the lover and dissimulation in the object of his love, it may be so. But even a poem or a picture will often not reveal its beauty except by the expenditure of time and study. It is foolish to expect that the secret beauty of a human person will reveal itself more easily. The lover is an artist, an artist who constructs an image, it is true, but only by patient and concentrated attention to nature; he knows the defects of his image, probably better than anyone, but he knows also that art lies, not in the avoidance of defects, but in the realization of those traits which swallow up defects and so render them non-existent. A great artist, Rodin, after a life spent in the study of Nature, has declared that for art there is no ugliness in Nature. "I have arrived at this belief by the study of Nature," he said; "I can only grasp the beauty of the soul by the beauty of the body, but some day one will come who will explain what I only catch a glimpse of and will declare how the whole earth is beautiful, and all human beings beautiful. I have never been able to say this in sculpture so well as I wish and as I feel it affirmed within me. For poets Beauty has always been some particular landscape, some particular woman; but it should be all women, all landscapes. A negro or a Mongol has his beauty, however remote from ours, and it must be the same with their characters. There is no ugliness. When I was young I made that mistake, as others do; I could not undertake a woman's bust unless I thought her pretty, according to my particular idea of beauty; to-day I should do the bust of any woman, and it would be just as beautiful. And however ugly a woman may look, when she is with her lover she becomes beautiful; there is beauty in her character, in her passions, and beauty exists as soon as character or passion becomes visible, for the body is a casting on which passions are imprinted. And even without that, there is always the blood that flows in the veins and the air that fills the lungs." [68]

The saint, also, is here at one with the lover and the artist. The man who has so profoundly realized the worth of his fellow men that he is ready even to die in order to save them, feels that he has discovered a great secret. Cyphers traces the "secret delights" that have thus risen in the hearts of holy men to the same source as the feelings generated between lovers, friends, parents, and children. "A few have at intervals walked in the world," he remarks, "who have, each in his own original way, found out this marvel.... Straightway man in general has become to them so sweet a thing that the infatuation has seemed to the rest of their fellows to be a celestial madness. Beggars' rags to their unhesitating lips grew fit for kissing, because humanity had touched the garb; there were no longer any menial acts, but only welcome services.... Remember by how much man is the subtlest circumstance in the world; at how many points he can attach relationships; how manifold and perennial he is in his results. All other things are dull, meager, tame beside him." [69]

It may be added that even if we still believe that lover and artist and saint are drawing the main elements of their conceptions from the depths of their own consciousness, there is a sense in which they are coming nearer to the truth of things than those for whom their conceptions are mere illusions. The aptitude for realizing beauty has involved an adjustment of the nerves and the associated brain centers through countless ages that began before man was. When the vision of supreme beauty is slowly or suddenly realized by anyone, with a reverberation that extends throughout his organism, he has attained to something which for his species, and for far more than his species, is truth, and can only be illusion to one who has artificially placed himself outside the stream of life.

In an essay on "The Gods as Apparitions of the Race-Life," Edward Carpenter, though in somewhat Platonic phraseology, thus well states the matter: "The youth sees the girl; it may be a chance face, a chance outline, amid the most banal surroundings. But it gives the cue. There is a memory, a confused reminiscence. The mortal figure without penetrates to the immortal figure within, and there rises into consciousness a shining form, glorious, not belonging to this world, but vibrating with the age-long life of humanity, and the memory of a thousand love-dreams. The waking of this vision intoxicates the man; it glows and burns within him; a goddess (it may be Venus herself) stands in the sacred place of his temple; a sense of awe-struck splendor fills him, and the

world is changed." "He sees something" (the same writer continues in a subsequent essay, "Beauty and Duty") "which, in a sense, is more real than the figures in the street, for he sees something that has lived and moved for hundreds of years in the heart of the race; something which has been one of the great formative influences of his own life, and which has done as much to create those very figures in the street as qualities in the circulation of the blood may do to form a finger or other limb. He comes into touch with a very real Presence or Power--one of those organic centers of growth in the life of humanity--and feels this larger life within himself, subjective, if you like, and yet intensely objective. And more. For is it not also evident that the woman, the mortal woman who excites his Vision, has some closest relation to it, and is, indeed, far more than a mere mask or empty formula which reminds him of it? For she indeed has within her, just as much as the man has, deep subconscious Powers working; and the ideal which has dawned so entrancingly on the man is in all probability closely related to that which has been working most powerfully in the heredity of the woman, and which has most contributed to mold her form and outline. No wonder, then, that her form should remind him of it. Indeed, when he looks into her eyes he sees through to a far deeper life even than she herself may be aware of, and yet which is truly hers--a life perennial and wonderful. The more than mortal in him beholds the more than mortal in her; and the gods descend to meet."

(Edward Carpenter, The Art of Creation, pp. 137, 186.)

It is this mighty force which lies behind and beneath the aberrations we have been concerned with, a great reservoir from which they draw the life-blood that vivifies even their most fantastic shapes. Fetichism and the other forms of erotic symbolism are but the development and the isolation of the crystallizations which normally arise on the basis of sexual selection. Normal in their basis, in their extreme forms they present the utmost pathological aberrations of the sexual instinct which can be attained or conceived. In the intermediate space all degrees are possible. In the slightest degree the symbol is merely a specially fascinating and beloved feature in a person who is, in all other respects, felt to be lovable; as such its recognition is a legitimate part of courtship, an effective aid to tumescence. In a further degree the symbol is the one arresting and attracting character of a person who must, however, still be felt as a sexually attractive individual. In a still further degree of perversion the symbol is effective, even though the

person with whom it is associated is altogether unattractive. In the final stage the person and even all association with a person disappear altogether from the field of sexual consciousness; the abstract symbol rules supreme.

Long, however, before the symbol has reached that final climax of morbid intensity we may be said to have passed beyond the sphere of sexual love. A person, not an abstracted quality, must be the goal of love. So long as the fetich is subordinated to the person it serves to heighten love. But love must be based on a complexus of attractive qualities, or it has no stability.[70] As soon as the fetich becomes isolated and omnipotent, so that the person sinks into the background as an unimportant appendage of the fetich, all stability is lost. The fetichist now follows an impersonal and abstract symbol whithersoever it may lead him.

It has been seen that there are an extraordinary number of forms in which erotic symbolism may be felt. It must be remembered, and it cannot be too distinctly emphasized, that the links that bind together the forms of erotic symbolism are not to be found in objects or even in acts, but in the underlying emotion. A feeling is the first condition of the symbol, a feeling which recalls, by a subtle and unconscious automatic association of resemblance or of contiguity, some former feeling. It is the similarity of emotion, instinctively apprehended, which links on a symbol only partially sexual, or even apparently not sexual at all, to the great central focus of sexual emotion, the great dominating force which brings the symbol its life-blood.[71]

The cases of sexual hyperaesthesia, quoted at the beginning of this study, do but present in a morbidly comprehensive and sensitive form those possibilities of erotic symbolism which, in some degree, or at some period, are latent in most persons. They are genuinely instinctive and automatic, and have nothing in common with that fanciful and deliberate play of the intelligence around sexual imagery--not infrequently seen in abnormal and insane persons--which has no significance for sexual psychology.

It is to the extreme individualization involved by the developments of erotic symbolism that the fetichist owes his morbid and perilous isolation. The lover who is influenced by all the elements of sexual selection is always supported by the fellow-feeling of a larger body of other human beings; he has behind him his species, his sex, his nation, or at the very least a fashion. Even the inverted lover in most cases is soon

able to create around him an atmosphere constituted by persons whose ideals resemble his own. But it is not so with the erotic symbolist. He is nearly always alone. He is predisposed to isolation from the outset, for it would seem to be on a basis of excessive shyness and timidity that the manifestations of erotic symbolism are most likely to develop. When at length the symbolist realizes his own aspirations--which seem to him for the most part an altogether new phenomenon in the world--and at the same time realizes the wide degree in which they deviate from those of the rest of mankind, his natural secretiveness is still further reinforced. He stands alone. His most sacred ideals are for all those around him a childish absurdity, or a disgusting obscenity, possibly a matter calling for the intervention of the policeman. We have forgotten that all these impulses which to us seem so unnatural--this adoration of the foot and other despised parts of the body, this reverence for the excretory acts and products, the acceptance of congress with animals, the solemnity of self-exhibition--were all beliefs and practices which, to our remote forefathers, were bound up with the highest conceptions of life and the deepest ardors of religion.

A man cannot, however, deviate at once so widely and so spontaneously in his impulses from the rest of the world in which he himself lives without possessing an aboriginally abnormal temperament. At the very least he exhibits a neuropathic sensitiveness to abnormal impressions. Not infrequently there is more than this, the distinct stigmata of degeneration, sometimes a certain degree of congenital feeble-mindedness or a tendency to insanity.

Yet, regarded as a whole, and notwithstanding the frequency with which they witness to congenital morbidity, the phenomena of erotic symbolism can scarcely fail to be profoundly impressive to the patient and impartial student of the human soul. They often seem absurd, sometimes disgusting, occasionally criminal; they are always, when carried to an extreme degree, abnormal. But of all the manifestations of sexual psychology, normal and abnormal, they are the most specifically human. More than any others they involve the potently plastic force of the imagination. They bring before us the individual man, not only apart from his fellows, but in opposition, himself creating his own paradise. They constitute the supreme triumph of human idealism.

the Hymen.

In analyzing the sexual impulse we have seen that the process whereby the conjunction of the sexes is achieved falls naturally into two phases: the first phase, of tumescence, during which force is generated in the organism, and the second phase, of detumescence, in which that force is discharged during conjugation.[72] Hitherto we have been occupied mainly with the first phase, that of tumescence, and with its associated psychic phenomena. It was inevitable that this should be so, for it is during the slow process of tumescence that sexual selection is decided, the crystallizations of love elaborated, and, to a large extent, the individual erotic symbols determined. But we can by no means altogether pass over the final phase of detumescence. Its consideration, it is true, brings us directly into the field of anatomy and physiology; while tumescence is largely under control of the will, when the moment of detumescence arrives the reins slip from the control of the will; the more fundamental and uncontrollable impulses of the organism gallop on unchecked; the chariot of Phaethon dashes blindly down into a sea of emotion.

Yet detumescence is the end and climax of the whole drama; it is an anatomico-physiological process, certainly, but one that inevitably touches psychology at every point.[73] It is, indeed, the very key to the process of tumescence, and unless we understand and realize very precisely what it is that happens during detumescence, our psychological analysis of the sexual impulse must remain vague and inadequate.

From the point of view we now occupy, a man and a woman are no longer two highly sensitive organisms vibrating, voluptuously it may indeed be, but vaguely and indefinitely, to all kinds of influences and with fluctuating impulses capable of being directed into any channel, even in the highest degree divergent from the proper ends of procreation. They are now two genital organisms who exist to propagate the race, and whatever else they may be, they must be adequately constituted to effect the act by which the future of the race is ensured. We have to consider what are the material conditions which ensure the most satisfactory and complete fulfillment of this act, and how those conditions may be correlated with other circumstances in the organism. In thus approaching the subject we shall find that we have not really abandoned the study of the psychic aspects of sex.

The two most primary sexual organs are the testis and the ovary; it is the object of conjugation to bring into contact the sperm from the testis with the germ from the ovary. There is no reason to suppose that the germ-cell and the sperm-cell are essentially different from each other. Sexual conjugation thus remains a process which is radically the same as the non-sexual mode of propagation which preceded it. The fusion of the nuclei of the two cells was regarded by Van Beneden, who in 1875 first accurately described it, as a process of conjugation comparable to that of the protozoa and the protophyta. Boveri, who has further extended our knowledge of the process, considers that the spermatozoon removes an inhibitory influence preventing the commencement of development in the ovum; the spermatozoon replaces a portion of the ovum which has already undergone degeneration, so that the object of conjugation is chiefly to effect the union of the properties of two cells in one, sexual fertilization achieving a division of labor with reciprocal inhibition; the two cells have renounced their original faculty of separate development in order to attain a fusion of qualities and thus render possible that production of new forms and qualities which has involved the progress of the organized world.[74]

While in fishes this conjugation of the male and female elements is usually ensured by the female casting her spawn into an artificial nest outside the body, on to which the male sheds his milt, in all animals (and, to some extent, birds, who occupy an intermediate position) there is an organic nest, or incubation chamber as Bland Sutton terms it, the womb, in the female body, wherein the fertilized egg may develop to a high degree of maturity sheltered from those manifold risks of the external world which make it necessary for the spawn of fishes to be so enormous in amount. Since, however, men and women have descended from remote ancestors who, in the manner of aquatic creatures, exercised functions of sperm-extrusion and germ-extrusion that were exactly analogous in the two sexes, without any specialized female uterine organization, the early stages of human male and female foetal development still display the comparatively undifferentiated sexual organization of those remote ancestors, and during the first months of foetal life it is practically impossible to tell by the inspection of the genital regions whether the embryo would have developed into a man or into a woman. If we examine the embryo at an early stage of development we see that the hind end is the body stalk, this stalk in later stages becoming part of the umbilical cord. The urogenital region, formed by the rapid extension of the hind end beyond its original limit, which corresponds to what is later the umbilicus, develops mainly by the gradual differentiation of structures

(the Wolffian and Muellerian bodies) which originally exist identically in both sexes. This process of sexual differentiation is highly complex, so that it cannot yet be said that there is complete agreement among investigators as to its details. When some irregularity or arrest of development occurs in the process we have one or other of the numerous malformations which may affect this region. If the arrest occurs at a very early stage we may even find a condition of things which seems to approximate to that which normally exists in the adult reptilia.[75] Owing to the fact that both male and female organs develop from more primitive structures which were sexually undifferentiated, a fundamental analogy in the sexual organs of the sexes always remains; the developed organs of one sex exist as rudiments in the other sex; the testicles correspond to the ovaries; the female clitoris is the homologue of the male penis; the scrotum of one sex is the labia majora in the other sex, and so throughout, although it is not always possible at present to be quite certain in regard to these homologies.

Since the object to be attained by the sexual organs in the human species is identical with that which they subserve in their pre-human ancestors, it is not surprising to find that these structures have a clear resemblance to the corresponding structures in the apes, although on the whole there would appear to be in man a higher degree of sexual differentiation. Thus the uterus of various species of *semnopithecus* seems to show a noteworthy correspondence with the same organ in woman.[76] The somewhat less degree of sexual differentiation is well shown in the gorilla; in the male the external organs are in the passive state covered by the wrinkled skin of the abdomen, while in the female, on the contrary, they are very apparent, and in sexual excitement the large clitoris and nymphae become markedly prominent. The penis of the gorilla, however, more nearly resembles that of man, according to Hartmann, than does that of the other anthropoid apes, which diverge from the human type in this respect more than do the cynocephalic apes and some species of baboon.

From the psychological point of view we are less interested in the internal sexual organs, which are most fundamentally concerned with the production and reception of the sexual elements, than with the more external parts of the genital apparatus which serve as the instruments of sexual excitation, and the channels for the intromission and passage of the seminal fluid. It is these only which can play any part at all in sexual selection; they are the only part of the sexual apparatus which can enter into the formation of either normal or abnormal erotic conceptions;

they are the organs most prominently concerned with detumescence; they alone enter normally into the conscious process of sex at any time. It seems desirable, therefore, to discuss them briefly at this point.

Our knowledge of the individual and racial variations of the external sexual organs is still extremely imperfect. A few monographs and collections of data on isolated points may be found in more or less inaccessible publications. As regards women, Ploss and Bartels have devoted a chapter to the sexual organs of women which extends to a hundred pages, but remains scanty and fragmentary. (*Das Weib*, vol. i, Chapter VI.) The most systematic series of observations have been made in the case of the various kinds of degenerates--idiots, the insane, criminals, etc.--but it would be obviously unsafe to rely too absolutely on such investigations for our knowledge of the sexual organs of the ordinary population.

There can be no doubt, however, that the external sexual organs in normal men and women exhibit a peculiarly wide range of variation. This is indicated not only by the unsystematic results attained by experienced observers, but also by more systematic studies. Thus Herman has shown by detailed measurements that there are great normal variations in the conformation of the parts that form the floor of the female pelvis. He found that the projection of the pelvic floor varied from nothing to as much as two inches, and that in healthy women who had borne no children the distance between the coccyx and anus, the length of the perineum, the distance between the fourchette and the symphysis pubis, and the length of the vagina are subject to wide variations. (*Lancet*, October 12, 1889.) Even the female urethral opening varies very greatly, as has been shown by Bergh, who investigated it in nearly 700 women and reproduces the various shapes found; while most usually (in about a third of the cases observed), a longitudinal slit, it may be cross-shaped, star-shaped, crescentic, etc.; and while sometimes very small, in about 6 per cent. of the cases it admitted the tip of the little finger. (Bergh, *Monatsheft fuer Praktische Dermatologie*, 15 Sept., 1897.)

As regards both sexes, Stanley Hall states that "Dr. F.N. Seerley, who has examined over 2000 normal young men as well as many young women, tells me that in his opinion individual

variations in these parts are much greater even than those of face and form, and that the range of adult and apparently normal size and proportion, as well as function, and of both the age and order of development, not only of each of the several parts themselves, but of all their immediate annexes, and in females as well as males, is far greater than has been recognized by any writer. This fact is the basis of the anxieties and fears of morphological abnormality so frequent during adolescence." (G.S. Hall, Adolescence, vol. i, p. 414).

In accordance with the supreme importance of the part they play, and the intimately psychic nature of that part, the sexual organs, both internal and external, are very richly supplied with nerves. While the internal organs are very abundantly furnished with sympathetic nerves and ganglia, the external organs show the highest possible degree of specialization of the various peripheral nervous devices which the organism has developed for receiving, accumulating, and transmitting stimuli to the brain.[77]

"The number of conducting cords which attach the genitals to the nervous centers is simply enormous," writes Bryan Robinson; "the pudic nerve is composed of nearly all the third sacral and branches from the second and fourth sacral. As one examines this nerve he is forced to the conclusion that it is an enormous supply for a small organ. The periphery of the pudic nerve spreads itself like a fan over the genitals." The lesser sciatic nerve supplies only one muscle--the gluteus maximus--and then sends the large pudendal branch to the side of the penis, and hence the friction of coitus induces active contraction of the gluteus maximus, "the main muscle of coition." The large pudic and the pudendal constitute the main supply of the external genitals. In women the pudic nerve is equally large, but the pudendal much smaller, possibly, Bryan Robinson suggests, because women take a less active part in coitus. The nerve supply of the clitoris, however, is three or four times as large as that of the penis in proportion to size. (F.B. Robinson, "The Intimate Nervous Connection of the Genito-Urinary Organs With the Cerebro-Spinal and Sympathetic Systems," New York Medical Journal, March 11, 1893; id., The Abdominal Brain, 1899.)

Of all the sexual organs the penis is without doubt that which has most powerfully impressed the human imagination. It is the very emblem of generation, and everywhere men have contemplated it with a mixture of

reverence and shuddering awe that has sometimes, even among civilized peoples, amounted to horror and disgust. Its image is worn as an amulet to ward off evil and invoked as a charm to call forth blessing. The sexual organs were once the most sacred object on which a man could place his hands to swear an inviolate oath, just as now he takes up the Testament. Even in the traditions of the great classic civilization which we inherit the penis is *_fascinus_*, the symbol of all fascination. In the history of human culture it has had far more than a merely human significance; it has been the symbol of all the generative force of Nature, the embodiment of creative energy in the animal and vegetable worlds alike, an image to be held aloft for worship, the sign of all unconscious ecstasy. As a symbol, the sacred phallus, it has been woven in and out of all the highest and deepest human conceptions, so intimately that it is possible to see it everywhere, that it is possible to fail to see it anywhere.

In correspondence with the importance of the penis is the large number of names which men have everywhere bestowed upon it. In French literature many hundred synonyms may be found. They were also numerous in Latin. In English the literary terms for the penis seem to be comparatively few, but a large number of non-literary synonyms exist in colloquial and perhaps merely local usage. The Latin term *penis*, which has established itself among us as the most correct designation, is generally considered to be associated with *_pendere_* and to be connected therefore with the usually pendent position of the organ. In the middle ages the general literary term throughout Europe was *_coles_* (or *_colis_*) from *_caulis_*, a stalk, and *_virga_*, a rod. The only serious English literary term, *yard* (exactly equivalent to *_virga_*), as used by Chaucer--almost the last great English writer whose vocabulary was adequate to the central facts of life--has now fallen out of literary and even colloquial usage.

Pierer and Chaulant, in their anatomical and physiological *_Real-Lexicon_* (vol. vi, p. 134), give nearly a hundred synonyms for the penis. Hyrtl (*_Topographisches Anatomie_*, seventh edition, vol. ii, pp. 67-69), adds others. Schurig, in his *_Spermatologia_* (1720, pp. 89-91), also presents a number of names for the penis; in Chapter III (pp. 189-192) of the same book he discusses the penis generally with more fullness than most authors. Louis de Landes, in his *_Glossaire Erotique_* of the French language (pp. 239-242), enumerates several hundred literary synonyms for the penis, though many of them probably only occur once.

There is no thorough and comprehensive modern study of the penis on an anthropological basis (though I should mention a valuable and fully illustrated study of anthropological and pathological variations of the penis in a series of articles by Marandon de Montyel, "Des Anomalies des Organes Genitaux Externes Chez les Alienes," etc., *_Archives d'Anthropologie Criminelle_*, 1895), and it would be out of place here to attempt to collect the scattered notices regarding racial and other variations. It may suffice to note some of the evidence showing that such variations seem to be numerous and important. The Arab penis (according to Kocher) is slender and long (a third longer than the average European penis) and with a club-shaped glans. It undergoes little change when it enters the erect state. The foreskin leaves it quite free, and the Arab practices manual excitement at an early age to favor its development.

Among the Fuegians, also, according to Hyades and Deniker (*_Cap Horn_*, vol. vii, p. 153), the average length of the penis is 77 millimeters, which is longer than in Europeans.

In men of black race, also, the penis is decidedly large. Thus Sir H.H. Johnston (*_British Central Africa_*, p. 399) states this to be a universal rule. Among the Wankenda of Northern Nyassa, for instance, he remarks that, while the body is of medium size, the penis is generally large. He gives the usual length as about six inches, reaching nine or ten in erection. The prepuce, it is added, is often very long, and circumcision is practiced by many tribes.

Among the American negroes Hrdlicka has found, also (*_Proceedings American Association for the Advancement of Science_*, vol. xlvii, p. 475), that the penis in black boys is larger than in white boys.

The passages cited above suggest the question whether the penis becomes larger by exercise of its generative functions. Most old authors assert that frequent erection makes the penis large and long (Schurig, *_Spermatologia_*, p. 107). Galen noted that in singers and athletes, who were chaste in order to preserve their strength, the sexual parts were small and rugose, like those of old men, and that exercise of the organs from youth develops them; Roubaud, quoting this observation (*_Traite de*

l'Impuissance_, p. 373), agrees with the statement. It seems probable that there is an element of truth in this ancient belief. At the same time it must be remembered that the penis is only to small extent a muscular organ, and that the increase of size produced by frequent congestion of erectile tissues cannot be either rapid or pronounced. Variations in the size of the sexual organs are probably on the whole mainly inherited, though it is impossible to speak decisively on this point until more systematic observations become customary.

The scrotum has usually, in the human imagination, been regarded merely as an appendage of the penis, of secondary importance, although it is the garment of the primary and essential organs of sex, and the fact that it is not the seat of any voluptuous sensation has doubtless helped to confirm this position. Even the name is merely a mediaeval perversion of _scortum_, skin or hide. In classic times it was usually called the pouch or purse. The importance of the testicles has not, however, been altogether ignored, as the very word _testis_ itself shows, for the _testis_ is simply the _witness_ of virility.[78]

It is easy to understand why the penis should occupy this special place in man's thoughts as the supreme sexual organ. It is the one conspicuous and prominent portion of the sexual apparatus, while its aptitude for swelling and erecting itself involuntarily, under the influence of sexual emotion, gives it a peculiar and almost unique position in the body. At the same time it is the point at which, in the male body, all voluptuous sensation is concentrated, the only normal masculine center of sex.[79]

It is not easy to find any correspondingly conspicuous symbol of sex in the sexual region of women. In the normal position nothing is visible but the peculiarly human cushion of fat picturesquely termed the Mons Veneris (because, as Palfyn said, all those who enroll themselves under the banner of Venus must necessarily scale it), and even that is veiled from view in the adult by the more or less bushy plantation of hair which grows upon it. A triangle of varyingly precise definition is thus formed at the lower apex of the trunk, and this would sometimes appear to have been regarded as a feminine symbol.[80] But the more usual and typical symbol of femininity is the idealized ring (by some savages drawn as a lozenge) of the vulvar opening--the _yoni_ corresponding to the masculine _lingam_--which is normally closed from view by the larger lips arising from beneath the shadow of the _mons_. It is a symbol that, like the masculine phallus, has a double meaning among primitive peoples and is

sometimes used to call down a blessing and sometimes to invoke a curse.[81]

This external opening of the feminine genital passage with its two enclosing lips is now generally called the vulva. It would appear that originally (as by Celsus and Pliny) this term included the womb, also, but when the term "uterus" came into use "vulva" was confined (as its sense of folding doors suggests that it should be) to the external entrance. The classic term *cunus* for the external genitals was chiefly used by the poets; it has been the etymological source of various European names for this region, such as the old French *con*, which has now, however, disappeared from literature while even in popular usage it has given place to *lapin* and similar terms. But there is always a tendency, marked in most parts of the world, for the names of the external female parts to become indecorous. Even in classic antiquity this part was the *pudendum*, the part to be ashamed of, and among ourselves the mass of the population, still preserving the traditions of primitive times, continue to cherish the same notion.

The anatomy, anthropology, folk-lore, and terminology of the external and to some extent the internal feminine sexual region may be studied in the following publications, among others: Ploss, *Das Weib*, vol. i, Chapter VI; Hyrtl, *Topographisches Anatomie*, vol. ii, and other publications by the same scholarly anatomist; W.J. Stewart Mackay, *History of Ancient Gynaecology*, especially pp. 244-250; R. Bergh, "Symbolae ad Cognitionem Genitalium Externorum Foeminearum" (in Danish), *Hospitalstidende*, August, 1894; and also in *Monatshefte fuer Praktische Dermatologie*, 1897. D.S. Lamb, "The Female External Genital Organs," *New York Journal of Gynaecology*, August, 1894; R.L. Dickinson, "Hypertrophies of the Labia Minora and Their Significance," *American Gynecology*, September, 1902; Kryptadia (in various languages), vol. viii, pp. 3-11, 11-13, and many other passages. Several of Schurig's works (especially *Gynaecologia*, *Mulieria*, and *Parthenologia*) contain full summaries of the statements of the early writers.

The external or larger lips, like the mons veneris, are specifically human in their full development, for in the anthropoid apes they are small as is the mons, and in the lower apes absent altogether; they are, moreover, larger in the white than in the other human races. Thus in the negro, and to a less degree in the Japanese (Wernich) and the Javanese (Scherzer)

they are less developed than in women of white race. The greater lips develop in the foetus later than the lesser lips, which are thus at first uncovered; this condition thus constitutes an infantile state which occasionally (in less than 2 per cent. of cases, according to Bergh) persists in the adult. Their generally accepted name, labia majora, is comparatively modern.[82]

The outer sides of the labia majora are covered with hair, and on the inner sides, which are smooth and moist, but are not true mucous membrane, there are a few sweat glands and numerous large sebaceous glands. Bergh considers that there is little or no hair on the inner sides of the labia majora, but Lamb states that careful examination shows that from one- to two-thirds of the inner surface in adult women show hairs like those of the external surface. In brunettes and women of dark races this surface is pigmented; in dark races it is usually a slate gray. From an examination of 2200 young Danish prostitutes Bergh has found that there are two main varieties in the shape of the labia majora, with transitional forms. In the first and most frequent form the labia tend to be less marked and more effaced and separated at the upper and anterior part, often being lost in the sides of the mons and presenting a fissure which is broader in its upper part and showing the inner lips more or less bare. In the second form the labia are thicker and more outstanding and the inner edges lie in contact throughout their whole length, showing the *_rima pudendi_* as a long narrow fissure. Whatever the form, the labia close more tightly together in virgins and in young individuals generally than in the deflowered and the elderly. In children, as Martineau pointed out, the vulva appears to look directly forward and the clitoris and urinary meatus easily appear, while in adult women, and especially after attempts at coitus have been made, the vulva appears directed more below and behind, and the clitoris and meatus more covered by the labia majora; so that the child urinates forward, while the adult woman is usually able to urinate almost directly downwards in the erect position, though in some cases (as may occasionally be observed in the street) she can only do so when bending slightly forwards. This difference in the direction of the stream formerly furnished one of the methods of diagnosing virginity, an uncertain one, since the difference is largely due to age and individual variation. The main factor in the position and aspect of the vulva is pelvic inclination. (See Havelock

Ellis, *Man and Woman*, fourth edition, p. 64; Stratz, *Die Schoenheit des Weiblichen Koerpers*, Chapter XII.) In the European woman, according to Stratz, a considerable degree of pelvic inclination is essential to beauty, concealing all but the anterior third of the vulva. In negresses and other women of lower race the vulva, however, usually lies further back, being more conspicuous from behind than in European women; in this respect lower races resemble the apes. Those women of dark race, therefore, whose modesty is focused behind rather than in front thus have sound anatomical considerations on their side.

As Ploss and Bartels remark, a very common variation among European women consists in an unusually posterior position of the vulva and vaginal entrance, so that unless a cushion is placed under the buttocks it is difficult for the man to effect coitus in the usual position without giving much pain to the woman. They add that another anomaly, less easy to remedy, consists in an abnormally anterior position of the vaginal entrance close beneath the pelvic bone, so that, although intromission is easy, the spasmodic contraction of the vagina at the culmination of orgasm presses the penis against the bone and causes intolerable pain to the man.

The mons veneris and the labia majora are, after the age of puberty, always normally covered by a more or less profuse growth of hair. It is notable that the apes, notwithstanding their general tendency to hairiness, show no such special development of hair in this region. We thus see that all the external and more conspicuous portions of the sexual sphere in woman--the mons veneris, the labia majora, and the hair--represent not so much an animal inheritance, such as we commonly misrepresent them to be, but a higher and genuinely human development. As none of these structures subserve any clear practical use, it would appear that they must have developed by sexual selection to satisfy the aesthetic demands of the eye.[83]

The character and arrangement of the pubic hair, investigated by Eschricht and Voigt more than half a century ago, have been more recently studied by Bergh. As these observers have pointed out, there are various converging hair streams from above and below, the clitoris seeming to be the center towards which they are directed. The hair-covering thus formed is usually ample and, as a rule, is more so in brunettes than in blondes. It is nearly

always bent, curly and more or less spirally twisted.[84] There are frequently one or two curls at the commencement of the fissure, rolled outwards, and occasionally a well marked tuft in the middle line. In abundance the pubic hair corresponds with the axillary hair; when one region is defective in hair the other is usually so also. Strong eyebrows also usually indicate a strong development of pubic hair. But the hair of the head usually varies independently, and Bergh found that of 154 women with spare pubic hair 72 had good and often profuse hair on the head. Complete or almost complete absence of pubic hair is in Bergh's experience only found in about 3 per cent. of women; these were all young and blonde.

Rothe, in his investigation of the pubic hair of 1000 Berlin women, found that no two women were really alike in this respect, but there was a tendency to two main types of arrangement, with minor subdivisions, according as the hair tended to grow chiefly in the middle line extending laterally from that line, or to grow equally over the whole extent of the pubic region; these two groups included half the cases investigated.

In men the pubic hair normally ascends anteriorly in a faint line up to the navel, with tendency to form a triangle with the apex above, and posteriorly extends backwards to the anus. In women these anterior and posterior extensions are comparatively rare, or at all events are only represented by a few stray hairs. Rothe found this variation in 4 per cent. of North German women, though a triangle of hair was only found in 2 per cent.; Lombroso found it in 5 per cent, of Italian women; Bergh found it in only 1.6 per cent. among 1000 Danish prostitutes, all sixteen of whom with three exceptions were brunettes. In Vienna, among 600 women, Coe found only 1 per cent, with this distribution of hair, and states that they were women of decidedly masculine type, though Ploss and Bartels, as well as Rothe, find, however, that heterogeny, as they term the masculine distribution, is more common in blondes. The anterior extension of hair is usually accompanied by the posterior extension around the anus, usually very slight, but occasionally as pronounce as in men. (According to Rothe, however, anterior heterogeny comparatively rare.) These masculine variations in the extension of the pubic hair appear to be not uncommonly associated with other physical and psychic anomalies; it is on this account that they have sometimes been regarded as indications of a vicious or a criminal temperament; they are,

however, found in quite normal women.

The pubic hair of women is usually shorter than that of men, but thick, and the individual hairs stronger and larger in diameter than those of men, as Pfaff first showed; dark hair is usually stronger than light. In both length and size the individual variations are considerable. The usual length is about 2 inches, or 3-5 centimeters, occasionally reaching about 4 inches, or 9-10 centimeters, in the larger curls. In a series of 100 women attended during confinement in London and the north of England I have only once (in a rather blonde Lancashire woman) found the hair on labia reaching a conspicuous length of several inches and forming an obstruction to the manipulations involved in delivery. But Jahn delivered a woman whose pubic hair was longer than that of her head, reaching below her knee; Paulini also knew a woman whose pubic hair nearly reached her knees and was sold to make wigs; Bartholin mentions a soldier's wife who plaited her pubic hair behind her back; while Brantome has several references to abnormally long hair in ladies of the French court during the sixteenth century. In 8 cases out of 2200 Bergh found the pubic hair forming a large curly wig extending to the iliac spines. The individual hairs have occasionally been found so stiff and brush-like as to render coitus difficult.

In color the pubic hair, while generally approximating to that of the head, is sometimes (according to Rothe, in Germany, in one-third cases) lighter, and sometimes somewhat darker, as is found to be the case by Coe, especially in brunettes, and also by Bergh, in Denmark. Bergh remarks that it is generally intermediate in color between the eyebrows and the axillary hair, the latter being more or less decolorized by sweat, and that, owing to the influence of the urine and vaginal discharges, the labial hair is paler than that on the mons; blondes with dark eyebrows usually have dark hair on the mons. The hair on this spot, as Aristotle observed, is usually the last to turn gray.

The key to the genital apparatus in women from the psychic point of view, and, indeed, to some extent, its anatomical center, is to be found in the clitoris. Anatomically and developmentally the clitoris is the rudimentary analogue of the masculine penis. Functionally, however, its scope is very much smaller. While the penis both receives and imparts specific voluptuous sensations, and is at the same time both the intromittent organ

for the semen and the conduit for the urine, the sole function of the clitoris is to enter into erection under the stress of sexual emotion and receive and transmit the stimulatory voluptuous sensations imparted to it by friction with the masculine genital apparatus. It is so insignificant an organ that it is only within recent times that its homology with the penis has been realized. In 1844 Kobelt wrote in his important book, *Die Mannlichen und Weiblichen Wollust-Organe*, that in his attempt to show that the female organs are exactly analogous to the male the reader will probably be unable to follow him, while even Johannes Mueller, the father of scientific physiology, declared at about the same period that the clitoris is essentially different from the penis. It is indeed but three centuries since the clitoris was so little known that (in 1593) Realdus Columbus actually claimed the honor of discovering it. Columbus was not its discoverer, for Fallopius speedily showed that Avicenna and Albucasis had referred to it.[85] The Arabs appear to have been very familiar with it, and, from the various names they gave it, clearly understood the important part it plays in generating voluptuous emotion.[86] But it was known in classic antiquity; the Greeks called it myrton, the myrtle-berry; Galen and Soranus called it nymphe because it is covered as a bride is veiled, while the old Latin name was *tentigo*, from its power of entering into erection, and *columella*, the little pillar, from its shape. The modern term, which is Greek and refers to the sensitiveness of the part to voluptuous titillation, is said to have originated with Suidas and Pollux.[87] It was mentioned, though not adopted, by Rufus.

"The clitoris," declared Haller, "is a part extremely sensible and wonderfully prurient." It is certainly the chief though by no means the only point through which the immediate call to detumescence is conveyed to the female organism. It is, indeed, as Bryan Robinson remarks, "a veritable electrical bell button which, being pressed or irritated, rings up the whole nervous system."

The nervous supply of this little organ is very large, and the dorsal nerve of the clitoris is relatively three or four times larger than that of the penis. Yet the sensitive point of this organ is only 5 to 7 millimeters in extent. The length of the clitoris is usually rather over 2 centimeters (or about an inch) and 3 centimeters when erect; a length of 4 centimeters or more was regarded by Martineau as within the normal range of variation. It is not usual to find the clitoris longer than this in Europe (for among some races like the negro the clitoris is generally large), but all degrees of magnitude may be found as

rare exceptions. (See, e.g., Sir J.Y. Simpson, "Hermaphrodites," *_Obstetric Memoirs and Contributions_*, vol. ii, pp. 217-226; also Dickinson, loc. cit.) It was formerly thought that the clitoris is easily enlarged by masturbation, and Martineau believed that in this way it might be doubled in length. It is probable that slight enlargement of the clitoris may be caused by very frequent masturbation, but only to an insignificant extent, and it is impossible to diagnose masturbation from the size of the clitoris. Among the women of Lake Nyassa, as well as in the Caroline Islands, special methods are practiced for elongating the clitoris, but in Europe, at all events, it is probable that the variations in the size of the organ are mainly congenital. It may well be that a congenitally large clitoris is associated with an abnormally developed excitability of the sexual apparatus. Tilt stated (*_On Uterine and Ovarian Inflammation_*, p. 37) that in his experience there was a frequent though not invariable connection between a large clitoris and sexual proclivity. (Schurig referred to a case of intense and life-long sexual obsession associated with an extremely large clitoris, *_Gynaecologia_*, pp. 16-17.) Of recent years considerable importance has been attached by some gynecologists (e.g., R.T. Morris, "Is Evolution Trying to Do Away With the Clitoris?" *_Transactions American Association of Obstetricians and Gynecologists_*, vol. v, 1893) to preputial adhesions around the clitoris as a source of nervous disturbance and invalidism in young women.

While the clitoris is anatomically analogous to the penis, its actual mechanism under the stress of sexual excitement is somewhat different. As Lietaud long since pointed out, it cannot rise freely in erection as the penis can; it is apparently bound down by its prepuce and its frenulum. Waldeyer, in his book on the pelvis, states more precisely that, unlike the penis, when erect it retains its angle, only this becomes somewhat rounded so that the organ is to some slight extent lifted and protruded. Waldeyer considered that the clitoris was thus perfectly fitted to fulfill its part as the recipient of erotic stimulation from friction by the penis. Adler, however, has pointed out with considerable justice, that this is not altogether the case. The clitoris was developed in mammals who practiced the posterior mode of coitus; in this position the clitoris was beneath the penis, which was thus easily able in coitus to press it against the pubic bone close beneath which it is situated, and thus impart the compression and friction which the feminine organ craves. But in the

human anterior mode of coitus it is not necessarily brought into close contact with the penis during the act of coitus, and thus fails to receive powerful stimulation. Its restricted position, which is an advantage in posterior coitus, is a disadvantage in anterior coitus. Adler observes that it thus comes about that the human method of coitus, while by bringing breast to breast and face to face it has added a new dignity and refinement, a fresh source of enjoyment, to the embrace of the sexes, has not been an unmixed advantage to woman, for while man has lost nothing by the change, woman has now to contend with an increased difficulty in attaining an adequate amount of pressure on that "electric button" which normally sets the whole mechanism in operation.[88]

We may well bring into connection with the changed conditions brought about by anterior coitus the interesting fact that while the clitoris remains the most exquisitely sensitive of the sexual centers in woman, voluptuous sensitivity is much more widely diffused in woman than in man. Over the whole body, indeed, it is apt to be more distinctly marked than is usually the case in man. But even if we confine ourselves to the genital region, while in man that portion of the penis which enters the vagina, and especially the glans, is normally the only portion which, even during turgescence, is sensitive to voluptuous contacts, in woman the whole of the region comprised within the larger lips, including even the anus and internally the vagina and the vaginal portion of the womb,[89] become sensitive to voluptuous contacts. Deprived of the penis the ability of a man to experience specifically sexual sensations becomes very limited indeed. But the loss of the clitoris or of any other structure involves no correspondingly serious disability on women. Ablation of the clitoris for sexual hyperaesthesia has for this reason been abandoned, except under special circumstances. The members of the Russian Skoptzy sect habitually amputate the clitoris, nymphae, and breasts, yet many young Skoptzy women told the Russian physician, Guttceit, that they were perfectly well able to enjoy coitus.

Freud believes that in very young girls the clitoris is the exclusive seat of sexual sensation, masturbation at this age being directed to the clitoris alone, and spontaneous sexual excitement being confined to twitchings and erection of this organ, so that young girls are able, from their own experience, to recognize without instruction the signs of sexual excitement in boys. At a later age sexual excitability spreads from the clitoris to other regions--just as the easy inflammability of wood sets light to coal--though in the male the penis remains

from first to last normally the almost exclusive seat of specific excitability. (S. Freud, *_Drei Abhandlungen zur Sexualtheorie_*, p. 62.)

The anus would, however, seem to be sometimes an erogenous zone even at an early age. Titillation of the anus appears to be frequently pleasurable in women; and this is not surprising considering the high degree of erotic sensitivity which is easily developed at the body orifices where skin meets mucous membrane. (Thus the meatus of the urethra is a highly erogenous zone, as is sufficiently shown by the frequency with which hair-pins and other articles used in masturbation find their way into the bladder.) It is in this germinal sensitivity, undoubtedly, that we find a chief key to the practice of *_pedicatio_*. Freud attaches great importance to the anus as a sexually erogenous zone at a very early age, and considers that it very frequently makes its influence felt in this respect. He believes that intestinal catarrhs in very early life and haemorrhoids later tend to develop sensibility in the anus. He finds an indication that the anus has become a sexually erogenous zone when children wish to allow the contents of the rectum to accumulate so that defecation may by its increased difficulty involve voluptuous sensations, and adds that masturbatory excitation of the anus with the fingers is by no means rare in older children. (S. Freud, *_Op. cit._*, pp. 40-42.) A medical correspondent in India tells me of a European lady who derived, she said, "quite as much, indeed more," pleasure from digitally titillating her rectum as from vulvo-vaginal titillation; she had several times submitted to *_pedicatio_* and enjoyed it, though it was painful during penetration. The anus may retain this erogenous irritability even in old age, and Routh mentions the case of a lady of over 70, the reverse of lustful, who was so excited by the act of defecation that she was invariably compelled to masturbate, although this state of things was a source of great mental misery to her. (C.H.F. Routh, *_British Gynaecological Journal_*, February, 1887, p. 48.)

Boelsche has sought the explanation of the erogenous nature of the anus, and the key to *_pedicatio_*, in an atavistic return to the very remote amphibian days when the anus was combined with the sexual parts in a common cloaca. But it is unnecessary to invoke any vestigial inheritance from a vastly remote past when we bear

in mind that the innervation of these two adjoining regions is inevitably very closely related. The presence of a body exit with its marked and special sensitivity at a point where it can scarcely fail to receive the nervous overflow from an immensely active center of nervous energy quite adequately accounts for the phenomenon in question.

The inner lips, the nymphae or labia minora, running parallel with the greater lips which enclose them, embrace the clitoris anteriorly and extend backward, enclosing the urethral exit between them as well as the vaginal entrance. They form little wings whence their old Latin name, *_alae_*, and from their resemblance to the cock's comb were by Spigelius termed *crista galli*. The red and (especially in brunettes) dark appearance of the nymphae suggests that they are mucous membrane and not integumentary; it is, however, now considered that even on the inner surface they are covered by skin and separated from the mucous membrane by a line.[90] In structure, as described by Waldeyer, they consist of fine connective tissue rich in elastic fibers as well as some muscular tissue, and full of large veins, so that they are capable of a considerable degree of turgescence resembling erection during sexual excitement, while Ballantyne finds that the nymphae are supplied to a notable extent with nervous end-organs.

More than any other part of the sexual apparatus in either sex, the lesser lips, on account of their shape, their position, and their structure, are capable of acquired modifications, more especially hypertrophy and elongation. By stretching, it is stated, a labium can be doubled in its dimensions. The "Hottentot apron," or elongated nymphae, commonly found among some peoples in South Africa, has long been a familiar phenomenon. In such cases a length or transverse diameter of 3 to 5 centimeters is commonly found. But such elongated nymphae are by no means confined to one part of the world or to one race; they are quite common among women of European race, and reach a size equal to most of the more reliably recorded Hottentot cases. Dickinson, who has very carefully studied this question in New York, finds that in 1000 consecutive gynaecological cases the labia showed some form of hypertrophy in 36 per cent., or more than 1 in 3; while among 150 of these cases who were neurasthenic, the proportion reached 56 per cent., even when minor or doubtful enlargements were disregarded. Bergh, in about 16 per cent. cases, found very enlarged nymphae, the height reached in about 5 per cent. of the cases of enlargement being nearly six centimeters. Ploss and Bartels, in a full discussion: of the "Hottentot apron," come to the conclusion that this

condition is perhaps in most cases artificially produced. It is known that among the Basutos it is the custom for the elder girls to manipulate the nymphae of younger children, when alone with them, almost from birth, and on account of the elastic nature of these structures such manipulation quite adequately accounts for the elongation. It is not necessary to suppose that the custom is practiced for the sake of producing sexual stimulation--though this may frequently occur--since there are numerous similar primitive customs involving deformation of the sexual organs without the production of sexual excitement. Dickinson has come to a similar conclusion as regards the corresponding elongation of the nymphae in civilized European women. In 361 out of 1000 women of good social class he found elongation or thickening, often with a notable degree of wrinkling and pigmentation, and believes that this is always the result of frequently repeated masturbation practiced with the separation of the nymphae; in 30 per cent. of the cases admission of masturbation was made.[91] While this conclusion is probably correct in the main, it requires some qualification. To assert that whenever in women who have not been pregnant the marked protrusion of the inner lips beyond the outer lips means that at some period manipulation has been practiced with or without the production of sexual excitement is to make too absolute a statement. It is highly probable that the nymphae, like the clitoris, are congenitally more prominent in some of the lower human races, as they are also in the apes; among the Fuegians, for instance, according to Hyades and Deniker, the labia minora descend lower than in Europeans, although there is not the slightest reason to suppose that these women practice any manipulations. Among European women, again, the nymphae sometimes protrude very prominently beyond the labia majora in women who are organically of somewhat infantile type; this occurs in cases in which we may be convinced that no manipulations have ever been practiced.[92]

It is difficult to speak very decisively as to the function of the labia minora. They doubtless exert some amount of protective influence over the entrance to the vagina, and in this way correspond to the lips of the mouth after which they are called. They fulfill, however, one very definite though not obviously important function which is indicated by the mythologic name they have received. There is, indeed, some obscurity in the origin of this term, nymphae, which has not, I believe, been satisfactorily cleared up. It has been stated that the Greek name nymphe has been transferred from the clitoris to the labia minora. Any such transfer could only have taken place when the meaning of the word had been forgotten, and nymphe had become the totally different word *_nymphae_*, the goddesses who presided over streams. The old anatomists were much

exercised in their minds as to the meaning of the name, but on the whole were inclined to believe that it referred to the action of the labia minora in directing the urinary stream. The term *nymphae* was first applied in the modern sense, according to Bergh, in 1599, by Pinaeus, mainly from the influence of these structures on the urinary stream, and he dilated in his *_De Virginitate_* on the suitability of the term to designate so poetic a spot.[93] In more modern times Luschka and Sir Charles Bell considered that it is one of the uses of the *nymphae* to direct the stream of urine, and Lamb from his own observation thinks the same conclusion probable. In reality there cannot be the slightest doubt about the function of the *nymphae*, as, in Hyrtl's phrase, "the naiads of the urinary source," and it can be demonstrated by the simplest experiment.[94]

The *nymphae* form the intermediate portal of the vagina, as the canal which conducts to the womb was in anatomy first termed (according to Hyrtl) by De Graaf.[95] It is a secreting, erectile, more or less sensitive canal lined by what is usually considered mucous membrane, though some have regarded it as integument of the same character as that of the external genitals; it certainly resembles such integument more than, for instance, the mucous membrane of the rectum. In the woman who has never had sexual intercourse and has been subjected to no manipulations or accidents affecting this region, the vagina is closed by a last and final gate of delicate membrane--scarcely admitting more than a slender finger--called the hymen.

The poets called the hymen "*flos virginittis*," the flower of virginity, whence the medico-legal term *_defloratio_*. Notwithstanding the great significance which has long been attached to the phenomena connected with it, the hymen was not accurately known until Vesalius, Fallopius, and Spigelius described and named it. It was, however, recognized by the Arab authors, Avicenna and Averroes. The early literature concerning it is summarized by Schurig, *_Muliebria_*, 1729, Section II, cap. V. The same author's *_Parthenologia_* is devoted to the various ancient problems connected with the question of virginity.

To say that this delicate piece of membrane is from the non-physical point of view a more important structure than any other part of the body is to convey but a feeble idea of the immense importance of the hymen in the eyes of the men of many past ages and even of our own times and among our own people.[96] For the uses of the feminine body, or for its beauty, there is no part which is more absolutely insignificant. But in human

estimation it has acquired a spiritual value which has made it far more than a part of the body. It has taken the place of the soul, that whose presence gives all her worth and dignity, even her name, to the unmarried woman, her purity, her sexual desirability, her market value. Without it--though in all physical and mental respects she might remain the same person--she has sometimes been a mark for contempt, a worthless outcast.[97]

So fragile a membrane scarcely possesses the reliability which should be possessed by a structure whose presence or absence has often meant so much. Its absence by no means necessarily signifies that a woman has had intercourse with a man. Its presence by no means signifies that she has never had such intercourse.

There are many ways in which the hymen may be destroyed apart from coitus. Among the Chinese (and also, it would appear, in India and some other parts of the East) the female parts are from infancy kept so scrupulously clean by daily washing, the finger being introduced into the vagina, that the hymen rapidly disappears, and its existence is unknown even to Chinese doctors. Among some Brazilian Indians a similar practice exists among mothers as regards their young children, less, however, for the sake of cleanliness than in order to facilitate sexual intercourse in future years. (Ploss and Bartels, *Das Weib*, vol. i, Chapter VI.) The manipulations of vaginal masturbation will, of course, similarly destroy the hymen. It is also quite possible for the hymen to be ruptured by falls and other accidents. (See, e.g., a lengthy study by Nina-Rodrigues, "Des Ruptures de l'Hymen dans les Chutes," *Annales d'Hygiene Publique*, September, 1903.)

On the other hand, integrity of the hymen is no proof of virginity, apart from the obvious fact that there may be intercourse without penetration. (The case has even been recorded of a prostitute with syphilitic condylomata, a somewhat masculine type of pubic arch, and vulva rather posteriorly placed, whose hymen had never been penetrated.) The hymen may be of a yielding or folding type, so that complete penetration may take place and yet the hymen be afterwards found unruptured. It occasionally happens that the hymen is found intact at the end of pregnancy. In some, though not all, of these cases there has been conception without intromission of the penis. This has occurred even when

the entrance was very minute. The possibility of such conception has long been recognized, and Schurig (*_Syllepsilogia_*, 1731, Section I, cap. VIII, p. 2) quotes ancient authors who have recorded cases. For some typical modern cases see Guerard (*_Centralblatt fuer Gynaekologie_*, No. 15, 1895), in one of whose cases the hymen of the pregnant woman scarcely admitted a hair; also Braun (*ib.*, No. 23, 1895).

The hymen has played a very definite and pronounced part in the social and moral life of humanity. Until recently it has been more difficult to decide what precise biological function it has exercised to ensure its development and preservation. Sexual selection, no doubt, has worked in its favor, but that influence has been very limited and comparatively very recent. Virginity is not usually of any value among peoples who are entirely primitive. Indeed, even in the classic civilization which we inherit, it is easy to show that the virgin and the admiration for virginity are of late growth; the virgin goddesses were not originally virgins in our modern sense. Diana was the many-breasted patroness of childbirth before she became the chaste and solitary huntress, for the earliest distinction would appear to have been simply between the woman who was attached to a man and the woman who followed an earlier rule of freedom and independence; it was a later notion to suppose that the latter woman was debarred from sexual intercourse. We certainly must not seek the origin of the hymen in sexual selection; we must find it in natural selection. And here it might seem at first sight that we come upon a contradiction in Nature, for Nature is always devising contrivances to secure the maximum amount of fertilization. "Increase and multiply" is so obviously the command of Nature that the Hebrews, with their usual insight, unhesitatingly dared to place it in the mouth of Jehovah. But the hymen is a barrier to fertilization. It has, however, always to be remembered that as we rise in the zoological scale, and as the period of gestation lengthens and the possible number of offspring is fewer, it becomes constantly more essential that fertilization shall be effective rather than easy; the fewer the progeny the more necessary it is that they shall be vigorous enough to survive. There can be little doubt that, as one or two writers have already suggested, the hymen owes its development to the fact that its influence is on the side of effective fertilization. It is an obstacle to the impregnation of the young female by immature, aged, or feeble males. The hymen is thus an anatomical expression of that admiration of force which marks the female in her choice of a mate. So regarded, it is an interesting example of the intimate manner in which sexual selection is really based on natural selection. Sexual selection is

but the translation into psychic terms of a process which has already found expression in the physical texture of the body.

It may be added that this interpretation of the biological function of the hymen is supported by the facts of its evolution. It is unknown among the lower mammals, with whom fertilization is easy, gestation short and offspring numerous. It only begins to appear among the higher mammals in whom reproduction is already beginning to take on the characters which become fully developed in man. Various authors have found traces of a rudimentary hymen, not only in apes, but in elephants, horses, donkeys, bitches, bears, pigs, hyenas, and giraffes. (Hyrtl, *Op. cit.*, vol. ii, p. 189; G. Gellhoen, "Anatomy and Development of the Hymen," *American Journal Obstetrics*, August, 1904.) It is in the human species that the tendency to limitation of offspring is most marked, combined at the same time with a greater aptitude for impregnation than exists among any lower mammals. It is here, therefore, that a physical check is of most value, and accordingly we find that in woman alone, of all animals, is the hymen fully developed.

FOOTNOTES:

[72] "Analysis of the Sexual Impulse," in vol. iii of these *Studies*.

[73] "The accomplishment of no other function," Hyrtl remarks, "is so intimately connected with the mind and yet so independent of it."

[74] The process is still, however, but imperfectly understood; see Art. "Fecondation," by Ed. Retterer, in Richet's *Dictionnaire de Physiologie*, vol. vi, 1905.

[75] Thus a male foetus showing reptilian characters in sexual ducts was exhibited by Shattock at the Pathological Society of London, February 19, 1895.

[76] J. Kohlbrugge, "Die Umgestaltung des Uterus der Affen nach den Geburt," *Zeitschrift fuer Morphologie*, bd. iv, p. 1, 1901.

[77] There are, however, no special nerve endings (Krause corpuscles), as was formerly supposed. The nerve endings in the genital region are the

same as elsewhere. The difference lies in the abundance of superposed arboreal ramifications. See, e.g., Ed. Retterer, Art. "Ejaculation," Richet's *Dictionnaire de Physiologie*, vol. v.

[78] Hyrtl, *Op. cit.*, vol. ii, p. 39.

[79] Sensations of pleasure without those of touch appear to be normal at the tip of the penis, as pointed out by Scripture, quoted in *Alienist and Neurologist*, January, 1898.

[80] See the previous volume of these *Studies*, "Sexual Selection in Man," p. 161.

[81] See, e.g., Ploss and Bartels, *Das Weib*, vol. i, beginning of chapter VI.

[82] Hyrtl states that the name *labia* was first used by Haller in the middle of the eighteenth century in his *Elements of Physiology*, being adopted by him from the Greek poet Erotion, who gave these structures the very obvious name *cheilea*, lips. But this seems to be a mistake, for the seventeenth century anatomists certainly used the name "labia" for these parts.

[83] Bergh tentatively suggests, as regards the pubic hair, that its appearance may be due to the upright walk in man and the human position during coitus, the hair preventing irritation of the genitals from the sweat pouring down from the body and protecting the skin from direct friction in coitus. (In both these suggestions he was, however, long previously anticipated by Fabricius ab Aquapendente.) The fanciful suggestion of Louis Robinson that the pubic hair has developed in order to enable the human infant to cling securely to his mother is very poorly supported by facts, and has not met with acceptance. It may be mentioned that (as stated by Ploss and Bartels) the women of the Bismarck Archipelago, whose pubic hair is very abundant, use it as a kind of handkerchief on which to clean their hands.

[84] Routh and Heywood Smith have noted that the pubic hair tends to lose its curliness and become straight in women who masturbate. (*British Gynaecological Journal*, February, 1887, p. 505.)

[85] Schurig, *Muliebria*, p. 75. Plazzon in 1621 said that in Italian it had a popular name, *il besneegio*.

[86] Schurig brought together in his *_Gynaecologia_* (pp. 2-4) various early opinions concerning the clitoris as the seat of voluptuous feeling.

[87] Hyrtl, *_Op. cit._*, vol. ii, p. 193.

[88] Adler, *_Die Mangelhafte Geschlechtsempfindung des Weibes_*, 1904, pp. 117-119.

[89] The voluptuous sensations caused by sexual contacts producing movements of the womb are probably normal and usual. They may even occur under circumstances unconnected with sexual emotion, and Munde (*_International Journal of Surgery_*, March, 1893) mentions incidentally that in one case while titillating the cervix with a sound the woman very plainly showed voluptuous manifestations.

[90] Henle stated that fine hairs are frequently visible on the nymphae; Stieda (*_Zeitschrift fuer Morphologie_*, 1902, p. 458) remarks that he has never been able to see them with the naked eye.

[91] R.L. Dickinson, "Hypertrophies of the Labia Minora and Their Significance," *_American Gynaecologist_*, September, 1902. It is perhaps noteworthy that Bergh found that in 302 cases in which the nymphae were of unequal length, in all but 24 the left was longer.

[92] It may be remarked that Bergh believes that the nymphae, and indeed the external genitals generally, are congenitally more strongly developed in libidinous persons, and at the same time in brunettes, while in public prostitutes this is not usually the case, which confirms the belief that exalted sexual sensibility does not usually lead to prostitution. He adds that prostitution, unless carried on for many years, has little effect on the shape of the external genitals.

[93] Schurig (*_Muliebria_*, 1729, Section II, cap. II) gives numerous quotations on this point; thus De Graaf wrote in his book on the sexual organs of women: "Tales protuberantiae nymphae appellantur ea propter quod aquis e vesica prosilientibus proxime adstare reperiantur, quandoquidem inter illas, tanquam duos parietes, urina magno impetu cum sibilo saepe et absque labiorum irrigatione erumpit, vel quod sint castitatis praesides, aut sponsam primo intromittant."

[94] Havelock Ellis, "The Bladder as a Dynamometer," *_American Journal of*

Dermatology_, May, 1902. If a woman who has never been pregnant, standing in the erect position before commencing the act of urination presses apart the labia minora with index and middle fingers the stream will be projected forward so as to fall usually at a considerable distance in front of a vertical line from the meatus; if when the act is half completed the fingers are removed, the labia close together and the stream, though maintained at a constant pressure, at once changes its character and direction.

[95] In poetry this term was employed by Plautus, *_Pseudolus_*, Act IV, Sc. 7. The Greek *aidoion* sometimes meant vagina and sometimes the external sexual parts; *kolpos* was used for the vagina alone.

[96] It is curious, however, that the European physicians of the seventeenth and even eighteenth centuries were doubtful of its value as a sign of virginity and considered it often absent.

[97] For a summary of the beliefs and practices of various peoples with regard to the hymen and virginity see Ploss and Bartels, *_Das Weib_*, vol. i, Chapter XVI.

The Object of Detumescence--Erogenous Zones--The Lips--The Vascular Characters of Detumescence--Erectile Tissue--Erection in Woman--Mucous Emission in Women--Sexual Connection--The Human Mode of Intercourse--Normal Variations--The Motor Characters of Detumescence--Ejaculation--The Virile Reflex--The General Phenomena of Detumescence--The Circulatory and Respiratory Phenomena--Blood Pressure--Cardiac Disturbance--Glandular Activity--Distillatio--The Essentially Motor Character of Detumescence--Involuntary Muscular Irradiation to Bladder, etc.--Erotic Intoxication--Analogy of Sexual Detumescence and Vesical Tension--The Specifically Sexual Movements of Detumescence in Man--In Woman--The Spontaneous Movements of the Genital Canal in Woman--Their Function in Conception--Part Played by Active Movement of the Spermatozoa--The Artificial Injection of Semen--The Facial Expression During Detumescence--The Expression of Joy--The Occasional Serious Effects of Coitus.

We have seen what the object of detumescence is, and we have briefly considered the organs and structures which are chiefly concerned in the process. We have now to inquire what are the actual phenomena which take place during the act of detumescence.

Detumescence is normally linked closely to tumescence. Tumescence is the piling on of the fuel; detumescence is the leaping out of the devouring flame whence is lighted the torch of life to be handed on from generation to generation. The whole process is double and yet single; it is exactly analogous to that by which a pile is driven into the earth by the raising and then the letting go of a heavy weight which falls on to the head of the pile. In tumescence the organism is slowly wound up and force accumulated; in the act of detumescence the accumulated force is let go and by its liberation the sperm-bearing instrument is driven home. Courtship, as we commonly term the process of tumescence which takes place when a woman is first sexually approached by a man, is usually a highly prolonged process. But it is always necessary to remember that every repetition of the act of coitus, to be normally and effectively carried out on both sides, demands a similar double process; detumescence must be preceded by an abbreviated courtship.

This abbreviated courtship by which tumescence is secured or heightened in the repetition of acts of coitus which have become familiar, is mainly tactile.[98] Since the part of the man in coitus is more active and that of the woman more passive, the sexual sensitivity of the skin seems to be more pronounced in women. There are, moreover, regions of the surface of a woman's body where contact, when sympathetic, seems specially liable to arouse erotic excitement. Such erogenous zones are often specially marked in the breasts, occasionally in the palm of the hand, the nape of the neck, the lobule of the ear, the little finger; there is, indeed, perhaps no part of the surface of the body which may not, in some individuals at some time, become normally an erogenous zone. In hysteria the erotic excitability of these zones is sometimes very intense. The lips are, however, without doubt, the most persistently and poignantly sensitive region of the whole body outside the sphere of the sexual organs themselves. Hence the significance of the kiss as a preliminary of detumescence.[99]

The importance of the lips as a normal erogenous zone is shown by the experiments of Gualino. He applied a thread, folded on itself several times, to the lips, thus stimulating them in a simple

mechanical manner. Of 20 women, between the ages of 18 and 35, only 8 felt this as a merely mechanical operation, 4 felt a vaguely erotic element in the proceeding, 3 experienced a desire for coitus and in 5 there was actual sexual excitement with emission of mucus. Of 25 men, between the ages of 20 and 30, in 15 all sexual feeling was absent, in 7 erotic ideas were suggested with congestion of the sexual organs without erection, and in 3 there was the beginning of erection. It should be added that both the women and the men in whom this sexual reflex was more especially marked were of somewhat nervous temperament; in such persons erotic reactions of all kinds generally occur most easily. (Gualino, "Il Rifflesso Sessuale nell' eccitamento alle labbre," Archivio di Psichiatria, 1904, p. 341.)

As tumescence, under the influence of sensory stimulation, proceeds toward the climax when it gives place to detumescence, the physical phenomena become more and more acutely localized in the sexual organs. The process which was at first predominantly nervous and psychic now becomes more prominently vascular. The ancient sexual relationship of the skin asserts itself; there is marked surface congestion showing itself in various ways. The face tends to become red, and exactly the same phenomenon is taking place in the genital organs; "an erection," it has been said, "is a blushing of the penis." The difference is that in the genital organs this heightened vascularity has a definite and specific function to accomplish--the erection of the male organ which fits it to enter the female parts--and that consequently there has been developed in the penis that special kind of vascular mechanism, consisting of veins in connective tissue with unstriped muscular fibers, termed erectile tissue.[100]

It is not only the man who is supplied with erectile tissue which in the process of tumescence becomes congested and swollen. The woman also, in the corresponding external genital region, is likewise supplied with erectile tissue now also charged with blood, and exhibits the same changes as have taken place in her partner, though less conspicuously visible. In the anthropoid apes, as the gorilla, the large clitoris and the nymphae become prominent in sexual excitement, but the less development of the clitoris in women, together with the specifically human evolution of the mons veneris and larger lips, renders this sexual turgescence practically invisible, though it is perceptible to touch in an increased degree of spongy and elastic tension. The whole feminine genital canal, including the uterus, indeed, is richly supplied with blood-vessels, and is capable during sexual excitement of a very high degree of turgescence, a kind of

erection.

The process of erection in woman is accompanied by the pouring out of fluid which copiously bathes all parts of the vulva around the entrance to the vagina. This is a bland, more or less odorless mucus which, under ordinary circumstances, slowly and imperceptibly suffuses the parts. When, however, the entrance to the vagina is exposed and extended, as during a gynaecological examination which occasionally produces sexual excitement, there may be seen a real ejaculation of the fluid which, as usually described, comes largely from the glands of Bartholin, situated at the mouth of the vagina. Under these circumstances it is sometimes described as being emitted in a jet which is thrown to a distance.[101] This mucous ejaculation was in former days regarded as analogous to the seminal ejaculation in man, and hence essential to conception. Although this belief was erroneous the fluid poured out in this manner whenever a high degree of tumescence is attained, and before the onset of detumescence, certainly performs an important function in lubricating the entrance to the genital canal and so facilitating the intromission of the male organ.[102] Menstruation has a similar influence in facilitating coitus, as Schurig long since pointed out.[103] A like process takes place during parturition when the same parts are being lubricated and stretched in preparation for the protrusion of the foetal head. The occurrence of the mucous flow in tumescence always indicates that that process is actively affecting the central sexual organs, and that voluptuous emotions are present.[104]

The secretions of the genital canal and outlet in women are somewhat numerous. We have the odoriferous glands of sebaceous origin, and with them the prepuce of the clitoris which has been described as a kind of gigantic sebaceous follicle with the clitoris occupying its interior. (Hyrtl.) There is the secretion from the glands of Bartholin. There is again the vaginal secretion, opaque and albuminous, which appears to be alkaline when secreted, but becomes acid under the decomposing influence of bacteria, which are, however, harmless and not pathogenic. (Gow, Obstetrical Society of London, January 3, 1894.) There is, finally, the mucous uterine secretion, which is alkaline, and, being poured out during orgasm, is believed to protect the spermatozoa from destruction by the acid vaginal secretion.

The belief that the mucus poured out in women during sexual excitement is feminine semen and therefore essential to

conception had many remarkable consequences and was widespread until the seventeenth century. Thus, in the chapter "De Modo coeundi et de regimine eorum qui coeunt" of *_De Secretis Mulierum_*, there is insistence on the importance of the proper mixture of the male semen with the female semen and of arranging that it shall not escape from the vagina. The woman must lie quiet for several hours at least, not rising even to urinate, and when she gets up, be very temperate in eating and drinking, and not run or jump, pretending that she has a headache. It was the belief in feminine semen which led some theologians to lay down that a woman might masturbate if she had not experienced orgasm in coitus. Schurig in his *_Muliebria_* (1729, pp. 159, et seq.) discusses the opinions of old authors regarding the nature, source, and uses of the female genital secretions, and quotes authorities against the old view that it was female semen. In a subsequent work (*_Syllepsilogia_*, 1731, pp. 3, et seq.) he returns to the same question, quotes authors who accept a feminine semen, shows that Harvey denied it any significance, and himself decides against it. It has not seriously been brought forward since.

When erection is completed in both the man and the woman the conditions necessary for conjugation have at last been fulfilled. In all animals, even those most nearly allied to man, coitus is effected by the male approaching the female posteriorly. In man the normal method of male approach is anteriorly, face to face. Leonardo da Vinci, in a well-known drawing representing a sagittal section of a man and a woman connected in this position of so-called Venus obversa; has shown how well adapted the position is to the normal position of the organs in the human species.[105]

Among monkeys, it is stated, congress is sometimes performed when the female is on all fours; at other times the male brings the female between his thighs when he is sitting, holding her with his forepaws. Froriep informed Lawrence that the male sometimes supported his feet on the female's calves. (Sir W. Lawrence, *_Lectures on Physiology_*, 1823, p. 186.) A summary of the methods of congress practiced by the various animals below mammals will be found in the article "Copulation" by H. de Varigny in Richet's *_Dictionnaire de Physiologie_*, vol. iv.

The anterior position in coitus, with the female partner lying

supine, is so widespread throughout the world that it may fairly be termed the most typically human attitude in sexual congress. It is found represented in Egyptian graves at Benihassan, belonging to the Twelfth Dynasty; it is regarded by Mohammedans as the normal position, although other positions are permitted by the Prophet: "Your wives are your tillage: go in unto your tillage in what manner soever you will;" it is that adopted in Malacca; it appears, from Peruvian antiquities, to have been the position generally, though not exclusively, adopted in ancient Peru; it is found in many parts of Africa, and seems also to have been the most usual position among the American aborigines.

Various modifications of this position are, however, found. Thus, in some parts of the world, as among the Suahelis in Zanzibar, the male partner adopts the supine position. In Loango, according to Pechuel-Loesche, coitus is performed lying on the side. Sometimes, as on the west coast of Africa, the woman is supine and the man more or less erect; or, as among the Queenslanders (as described by Roth) the woman is supine and the man squats on his heels with her thighs clasping his flanks, while he raises her buttocks with his hands.

The position of coitus in which the man is supine is without doubt a natural and frequent variation of the specifically human obverse method of coitus. It was evidently familiar to the Romans. Ovid mentions it (*Ars Amatoria*, III, 777-8), recommending it to little women, and saying that Andromache was too tall to practice it with Hector. Aristophanes refers to it, and there are Greek epigrams in which women boast of their skill in riding their lovers. It has sometimes been viewed with a certain disfavor because it seems to confer a superiority on the woman. "Cursed be he," according to a Mohammedan saying, "who maketh woman heaven and man earth."

Of special interest is the wide prevalence of an attitude in coitus recalling that which prevails among quadrupeds. The frequency with which on the walls of Pompeii coitus is represented with the woman bending forward and her partner approaching her posteriorly has led to the belief that this attitude was formerly very common in Southern Italy. However that may be, it is certainly normal at the present day among various more or less primitive peoples in whom the vulva is often placed

somewhat posteriorly. It is thus among the Soudanese, as also, in an altogether different part of the world, among the Eskimo Innuits and Koniags. The New Caledonians, according to Foley, cohabit in the quadrupedal manner, and so also the Papuans of New Guinea (Bongu), according to Vahness. The same custom is also found in Australia, where, however other postures are also adopted. In Europe the quadrupedal posture would seem to prevail among some of the South Slavs, notably the Dalmatians. (The different methods of coitus practiced by the South Slavs are described in Kryptadia vol. vi, pp. 220, et seq.)

This method of coitus was recommended by Lucretius (lib. iv) and also advised by Paulus Aeginetus as favorable to conception. (The opinions of various early physicians are quoted by Schurig, *Spermatologia*, 1720, pp. 232, et seq.). It seems to be a position that is not infrequently agreeable to women, a fact which may be brought into connection with the remarks of Adler already quoted (p. 131) concerning the comparative lack of adjustment of the feminine organs to the obverse position. It is noteworthy that in the days of witchcraft hysterical women constantly believed that they had had intercourse with the Devil in this manner. This circumstance, indeed, probably aided in the very marked disfavor in which coitus *a posteriori* fell after the decay of classic influences. The mediaeval physicians described it as *mos diabolicus* and mistakenly supposed that it produced abortion (Hyrtl, op. cit., vol. ii, p. 87). The theologians, needless to say, were opposed to the *mos diabolicus*, and already in the Anglo-Saxon Penitential of Theodore, at the end of the seventh century, 40 days' penance is prescribed for this method of coitus.

From the frequency with which they have been adopted by various peoples as national customs, most of the postures in coitus here referred to must be said to come within the normal range of variation. It is a mistake to regard them as vicious perversions.

Up to the point to which we have so far considered it, the process of detumescence has been mainly nervous and vascular in character; it has, in fact, been but the more acute stage of a process which has been going on throughout tumescence. But now we reach the point at which a new element comes in: muscular action. With the onset of muscular action, which is mainly involuntary, even when it affects the voluntary muscles,

detumescence proper begins to take place. Henceforward purposeful psychic action, except by an effort, is virtually abolished. The individual, as a separate person, tends to disappear. He has become one with another person, as nearly one as the conditions of existence ever permit; he and she are now merely an instrument in the hands of a higher power--by whatever name we may choose to call that Power--which is using them for an end not themselves.

The decisive moment in the production of the instinctive and involuntary orgasm occurs when, under the influence of the stimulus applied to the penis by friction with the vagina, the tension of the seminal fluid poured into the urethra arouses the ejaculatory center in the spinal cord and the bulbo-cavernosus muscle surrounding the urethra responsively contracts in rhythmic spasms. Then it is that ejaculation occurs.[106]

"The circulation quickens, the arteries beat strongly," wrote Roubaud in a description of the physical state during coitus which may almost be termed classic; "the venous blood, arrested by muscular contraction, increases the general heat, and this stagnation, more pronounced in the brain by the contraction of the muscles of the neck and the throwing of the head backward, causes a momentary cerebral congestion, during which intelligence is lost and the faculties abolished. The eyes, violently injected, become haggard, and the look uncertain, or, in the majority of cases, the eyes are closed spasmodically to avoid the contact of the light. The respiration is hurried, sometimes interrupted, and may be suspended by the spasmodic contraction of the larynx, and the air, for a time compressed, is at last emitted in broken and meaningless words. The congested nervous centers only communicate confused sensations and volitions; mobility and sensation show extreme disorder; the limbs are seized by convulsions and sometimes by cramps, or are thrown wildly about or become stiff like iron bars. The jaws, tightly pressed, grind the teeth, and in some persons the delirium is carried so far that they bite to bleeding the shoulders their companions have imprudently abandoned to them. This frantic state of epilepsy lasts but a short time, but it suffices to exhaust the forces of the organism, especially in man. It is, I believe, Galen, who said: 'Omne animal post coitum triste praeter mulierem gallumque.'"[107] Most of the elements that make up this typical picture of the state of coitus are not absolutely essential to that state, but they all come within the normal range of variation. There can be no doubt that this range is considerable. There would appear to be not only individual, but also racial, differences; there is a remarkable passage in Vatsyayana's Kama Sutra describing the varying behavior of the women of

different races in India under the stress of sexual excitement--Dravidian women with difficulty attaining erethism, women of the Punjaub fond of being caressed with the tongue, women of Oude with impetuous desire and profuse flow of mucus, etc.--and it is highly probable, Ploss and Bartels remark, that these characterizations are founded on exact observations.[108]

The various phenomena included in Roubaud's description of the condition during coitus may all be directly or indirectly reduced to two groups: the first circulatory and respiratory, the second motor. It is necessary to consider both these aspects of the process of detumescence in somewhat greater detail, although while it is most convenient to discuss them separately, it must be borne in mind that they are not really separable; the circulatory phenomena are in large measure a by-product of the involuntary motor process.

With the approach of detumescence the respiration becomes shallow, rapid, and to some extent arrested. This characteristic of the breathing during sexual excitement is well recognized; so that in, for instance, the Arabian Nights, it is commonly noted of women when gazing at beautiful youths whose love they desired, that they ceased breathing.[109] It may be added that exactly the same tendency to superficial and arrested respiration takes place whenever there is any intense mental concentration, as in severe intellectual work.[110]

The arrest of respiration tends to render the blood venous, and thus aids in stimulating the vasomotor centers, raising the blood-pressure in the body generally, and especially in the erectile tissues. High blood-pressure is one of the most marked features of the state of detumescence. The heart beats are stronger and quicker, the surface arteries are more visible, the conjunctivae become red. The precise degree of blood-pressure attained during coitus has been most accurately ascertained in the dog. In Bechterew's laboratory in St. Petersburg a manometer was introduced into the central end of the carotid artery of a bitch; a male dog was then introduced, and during coitus observations were made on the blood-pressure at the peripheral and central ends of the artery. It was found that there was a great general elevation of blood-pressure, intense hyperaemia of the brain, rapid alternations, during the act, of vasoconstriction and vasodilatation of the brain, with increase and diminution of the general arterial tension in relation with the various phases of the act, the greatest cerebral vasodilatation and hyperaemia coinciding with the moment following the intromission of the

penis; the end of the act is followed by a considerable fall in the blood-pressure.[111] I am not acquainted with any precise observations on the blood-pressure in human subjects during detumescence, and there are obvious difficulties in the way of such observations. It is probable, however, that the conditions found would be substantially the same. This is indicated, so far as the very marked increase of blood-pressure is concerned, by some observations made by Vaschide and Vurpas with the sphygmanometer on a lady under the influence of sexual excitement. In this case there was a relationship of sympathy and friendly tenderness between the experimenter and the subject, Madame X, aged 25. Experimenter and subject talked sympathetically, and finally, we are told, while the latter still had her hands in the sphygmanometer, the former almost made a declaration of love. Madame X was greatly impressed, and afterward admitted that her emotions had been genuine and strong. The blood-pressure, which was in this subject habitually 65 millimeters, rose to 150 and even 160, indicating a very high pressure, which rarely occurs; at the same time Madame X looked very emotional and troubled.[112]

Some authorities are of opinion that irregularities in the accomplishment of the sexual act are specially liable to cause disturbances in the circulation. Thus Kisch, of Prague, refers to the case of a couple practising coitus interruptus--the husband withdrawing before ejaculation--in which the wife, a vigorous woman, became liable after some years to attacks termed by Kisch *_neurasthenia cordis vasomotoria_*, in which there was at daily or longer intervals palpitation, with feelings of anxiety, headache, dizziness, muscular weakness and tendency to faint. He regards coitus as a cause of various heart troubles in women: (1) Attacks of tachycardia in very excitable and sexually inclined women; (2) attacks of tachycardia with dyspnoea in young women, with vaginismus; (3) cardiac symptoms with lowered vascular tone in women who for a long time have practised coitus interruptus without complete sexual gratification (Kisch, "Herzbeschwerden der Frauen verursacht durch den Cohabitationsact," *_Muenchener Medizinisches Wochenschrift_*, 1897, p. 617). In this connection, also, reference may probably be made to those attacks of anxiety which Freud associates with psychic sexual lesions of an emotional character.

Associated with this vascular activity in detumescence we find a general tendency to glandular activity. Various secretions are formed abundantly. Perspiration is copious, and the ancient relationship between the

cutaneous and sexual systems seems to evoke a general activity of the skin and its odoriferous secretions. Salivation, which also occurs, is very conspicuous in many lower animals, as for instance in the donkey, notably the female, who just before coitus stands with mouth open, jaws moving, and saliva dribbling. In men, corresponding to the more copious secretion in women, there is, during the latter stages of tumescence, a slight secretion of mucus--Fuerbringer's *_urethrorrhoea ex libidine_*--which appears in drops at the urethral orifice. It comes from the small glands of Littre and Cowper which open into the urethra. This phenomenon was well known to the old theologians, who called it *_distillatio_*, and realized its significance as at once distinct from semen and an indication that the mind was dwelling on voluptuous images; it was also known in classic times[113]; more recently it has often been confused with semen and has thus sometimes caused needless anxiety to nervous persons. There is also an increased secretion of urine, and it is probable that if the viscera were more accessible to observation we might be able to demonstrate that the glands throughout the body share in this increased activity.

The phenomena of detumescence culminate, however, and have their most obvious manifestation in motor activity. The genital act, as Vaschide and Vurpas remark, consists essentially in "a more and more marked tension of the motor state which, reaching its maximum, presents a short tonic phase, followed by a clonic phase, and terminates in a period of adynamia and repose." This motor activity is of the essence of the impulse of detumescence, because without it the sperm cells could not be brought into the neighborhood of the germ cell and be propelled into the organic nest which is assigned for their conjunction and incubation.

The motor activity is general as well as specifically sexual. There is a general tendency to more or less involuntary movement, without any increase of voluntary muscular power, which is, indeed, decreased, and Vaschide and Vurpas state that dynamometric results are somewhat lower than normal during sexual excitement, and the variations greater.[114] The tendency to diffused activity of involuntary muscle is well illustrated by the contraction of the bladder associated with detumescence. While this occurs in both sexes, in men erection produces a mechanical impediment to any evacuation of the bladder. In women there is not only a desire to urinate but, occasionally, actual urination. Many quite healthy and normal women have, as a rare accident supervening on the coincidence of an unusually full bladder with an unusual degree of sexual excitement, experienced a powerful and quite involuntary evacuation of the bladder at the moment of orgasm. In women with less normal nervous systems this has,

more rarely, been almost habitual. Brantome has perhaps recorded the earliest case of this kind in referring to a lady he knew who "quand on lui faisait cela elle se compissait a bon escient."[115] The tendency to trembling, constriction of throat, sneezing, emission of internal gas, and the other similar phenomena occasionally associated with detumescence, are likewise due to diffusion of the motor disturbance. Even in infancy the motor signs of sexual excitement are the most obvious indications of orgasm; thus West, describing masturbation in a child of six or nine months who practiced thigh-rubbing, states that when sitting in her high chair she would grasp the handles, stiffen herself, and stare, rubbing her thighs quickly together several times, and then come to herself with a sigh, tired, relaxed, and sweating, these seizures, which lasted one or two minutes, being mistaken by the relations for epileptic fits.[116]

The essentially motor character of detumescence is well shown by the extreme forms of erotic intoxication which sometimes appear as the result of sexual excitement. Fere, who has especially called attention to the various manifestations of this condition, presents an instructive case of a man of neurotic heredity and antecedents, in whom it occasionally happened that sexual excitement, instead of culminating in the normal orgasm, attained its climax in a fit of uncontrollable muscular excitement. He would then sing, dance, gesticulate, roughly treat his partner, break the objects around him, and finally sink down exhausted and stupefied. (Fere, *L'Instinct Sexuel*, Chapter X.) In such a case a diffused and general detumescence has taken the place of the normal detumescence which has its main focus in the sexual sphere.

The same relationship is shown in a case of impotence accompanied by cramps in the calves and elsewhere, which has been recorded by Bruegelmann ("*Zur Lehre vom Perversen Sexualismus*," *Zeitschrift fuer Hypnotismus*, 1900, Heft I). These muscular conditions ceased for several days whenever coitus was effected.

An instructive analogy to the motor irradiations preceding the moment of sexual detumescence may be found in the somewhat similar motor irradiations which follow the delayed expulsion of a highly distended bladder. These sometimes become very marked in a child or young woman unable to control the motor system absolutely. The legs are crossed, the foot swung, the thighs tightly pressed together, the toes curled. The fingers are flexed

in rhythmic succession. The whole body slowly twists as though the seat had become uncomfortable. It is difficult to concentrate the mind; the same remark may be automatically repeated; the eyes search restlessly, and there is a tendency to count surrounding objects or patterns. When the extreme degree of tension is reached it is only by executing a kind of dance that the explosive contraction of the bladder is restrained.

The picture of muscular irradiation presented under these circumstances differs but slightly from that of the onset of detumescence. In one case the explosion is sought, in the other case it is dreaded; but in both cases there is a retarded muscular tension,--in the one case involuntary, in the other case voluntary--maintained at a point of acute intensity, and in both cases the muscular irradiations of this tension spread over the whole body.

The increased motor irritability of the state of detumescence somewhat resembles the conditions produced by a weak anaesthetic and there is some interest in noting the sexual excitement liable to occur in anaesthesia. I am indebted to Dr. J.F.W. Silk for some remarks on this point:--

"I. Sexual emotions may apparently be aroused during the stage of excitement preceding or following the administration of any anaesthetic; these emotions may take the form of mere delirious utterances, or may be associated with what is apparently a sexual orgasm. Or reflex phenomena connected with the sexual organs may occasionally be observed under special circumstances; or, to put it in another way, such reflex possibilities are not always abolished by the condition of narcosis or anaesthesia.

"II. Of the particular anaesthetics employed I am inclined to think that the possibility of such conditions arising is inversely proportionate to their strength, e.g., they are more frequently observed with a weak anaesthetic like nitrous oxide than with chloroform.

"III. Sexual emotions I believe to be rarely observable in men, and this is remarkable, or, I should say, particularly noticeable, for the presence of nurses, female students, etc., might almost have led one to expect that the contrary would have

been the case. On the other hand, it is among men that I have frequently observed a reflex phenomenon which has usually taken the shape of an erection of the penis when the structures in the neighborhood of the spermatic cord have been handled.

"IV. Among females the emotional sexual phenomena most frequently obtrude themselves, and I believe that if it were possible to induce people to relate their dreams they would very often be found to be of a sexual character."

Much more important than the general motor phenomena, more purposive though involuntary, are the specifically sexual muscular movements. From the very beginning of detumescence, indeed, muscular activity makes itself felt, and the peripheral muscles of sex act, according to Kobelt's expression, as a peripheral sexual heart. In the male these movements are fairly obvious and fairly simple. It is required that the semen should be expressed from the vesiculae seminales, propelled along the urethra, in combination with the prostatic fluid which is equally essential, and finally ejected with a certain amount of force from the urethral orifice. Under the influence of the stimulation furnished by the contact and friction of the vagina, this process is effectively carried out, mainly by the rhythmic contractions of the bulbo-cavernosus muscle, and the semen is emitted in a jet which may be ejaculated to a distance varying from a few centimeters to a meter or more.

With regard to the details of the psychic sides of this process a correspondent, a psychologist, writes as follows:--

"I have never noticed in my reading any attempt to analyze the sensations which accompany the orgasm, and, as I have made a good many attempts to make such an analysis myself, I will append the results on the chance that they may be of some value. I have checked my results so far as possible by comparing them with the experience of such of my friends as had coitus frequently and were willing to tell me as much as they could of the psychology of the process.

"The first fact that I hit upon was the importance of pressure. As one of my informants picturesquely phrases it--'the tighter the fit the greater the pleasure.' This agrees, too, with their unanimous testimony that the pleasurable sensations were much greater when the orgasm occurred simultaneously in the man and

woman. Their analysis seldom went further than this, but a few remarked that the distinctive sensations accompanying the orgasm seem to begin near the root of the penis or in the testes, and that they are qualitatively different from the tickling sensations which precede them.

"These tickling sensations are caused, I think, by the friction of the glands against the vaginal walls, and are supplemented by other sensations from the urethra, whose nerves are stimulated by pressure of the vaginal walls and sphincter. The specific sensation of the orgasm begins, I believe, with a strong contraction of the muscles of the urethral walls along the entire length of the canal, and is felt as a peculiar ache starting from the base of the penis and quickly becoming diffused through the whole organ. This sensation reaches its climax with the expulsion of the semen into the urethra and the consequent feeling of distention, which is instantly followed by the rhythmic peristaltic contractions of the urethral muscles which mark the climax of the orgasm.

"The most careful introspection possible under the circumstances seems to show that these sensations arise almost wholly from the urethra and in a far less degree from the corona. During periods of great sexual excitement the nerves of the urethra and corona seem to possess a peculiar sensitivity and are powerfully stimulated by the violent peristaltic contractions of the muscles in the urethral walls during ejaculation. It seems possible that the intensity and volume of sensation felt at the glans may be due in part to the greater area of sensitive surface presented in the fossa as well as to the sensitivity of the corona, and in part to the fact that during the orgasm the glans is more highly congested than at any other time, and the nerve endings thus subjected to additional pressure.

"If the foregoing statements are true, it is easy to see why the pleasure of the man is much increased when the orgasm occurs at the same time in his partner and himself, for the contractions of the vagina upon the penis would increase the stimulation of all the nerve endings in that organ for which a mechanical stimulus is adequate, and the prominence of the corpus spongiosum and corona would ensure them the greatest stimulation. It seems not improbable that the specific sensation of orgasm rises from the

stimulation of the peculiar form of nerve end-bulbs which Krause found in the corpus spongiosum and in the glans.

"The characteristic massiveness of the experience is probably due largely to the great number of sensations of strain and pressure caused by the powerful reflex contraction of so many of the voluntary muscles.

"Of course, the foregoing analysis is purely tentative, and I offer it only on the chance that it may suggest some line of inquiry which may lead to results of value to the student of sexual psychology."

In man the whole process of detumescence, when it has once really begun, only occupies a few moments. It is so likewise in many animals; in the genera *Bos*, *Ovis*, etc., it is very short, almost instantaneous, and rather short also in the *Equidae* (in a vigorous stallion, according to Colin, ten to twelve seconds). As Disselhorst has pointed out, this is dependent on the fact that these animals, like man, possess a *vas deferens* which broadens into an *ampulla* serving as a receptacle which holds the semen ready for instant emission when required. On the other hand, in the dog, cat, boar, and the *Canidae*, *Felidae*, and *Suidae* generally, there is no receptacle of this kind, and coitus is slow, since a longer time is required for the peristaltic action of the *vas* to bring the semen to the urogenital sinus. (R. Disselhorst, *Die Accessorischen Geschlechtsdrusen der Wirbelthiere*, 1897, p. 212.)

In man there can be little doubt that detumescence is more rapidly accomplished in the European than in the East, in India, among the yellow races, or in Polynesia. This is probably in part due to a deliberate attempt to prolong the act in the East, and in part to a greater nervous erethism among Westerns.

In the woman the specifically sexual muscular process is less visible, more obscure, more complex, and uncertain. Before detumescence actually begins there are at intervals involuntary rhythmic contractions of the walls of the vagina, seeming to have the object of at once stimulating and harmonizing with those that are about to begin in the male organ. It would appear that these rhythmic contractions are the exaggeration of a phenomenon which is normal, just as slight contraction is normal and

constant in the bladder. Jastreboff has shown, in the rabbit, that the vagina is in constant spontaneous rhythmic contraction from above downward, not peristaltic, but in segments, the intensity of the contractions increasing with age and especially with sexual development. This vaginal contraction which in women only becomes well marked just before detumescence, and is due mainly to the action of the sphincter cunni (analogous to the bulbo-cavernosus in the male), is only a part of the localized muscular process. At first there would appear to be a reflex peristaltic movement of the Fallopian tubes and uterus. Dembo observed that in animals stimulation of the upper anterior wall of the vagina caused gradual contraction of the uterus, which is erected by powerful contraction of its muscular fiber and round ligaments while at the same time it descends toward the vagina, its cavity becoming more and more diminished and mucus being forced out. In relaxing, Aristotle long ago remarked, it aspirates the seminal fluid.

Although the active participation of the sexual organs in woman, to the end of directing the semen into the womb at the moment of detumescence, is thus a very ancient belief, and harmonizes with the Greek view of the womb as an animal in the body endowed with a considerable amount of activity,[117] precise observation in modern times has offered but little confirmation of the reality of this participation. Such observations as have been made have usually been the accidental result of sexual excitement and orgasm occurring during a gynaecological examination. As, however, such a result is liable to occur in erotic subjects, a certain number of precise observations have accumulated during the past century. So far as the evidence goes, it would seem that in women, as in mares, bitches, and other animals, the uterus becomes shorter, broader, and softer during the orgasm, at the same time descending lower into the pelvis, with its mouth open intermittently, so that, as one writer remarks, spontaneously recurring to the simile which commended itself to the Greeks, "the uterus might be likened to an animal gasping for breath." [118] This sensitive, responsive mobility of the uterus is, indeed, not confined to the moment of detumescence, but may occur at other times under the influence of sexual emotion.

It would seem probable that in this erection, contraction, and descent of the uterus, and its simultaneous expulsion of mucus, we have the decisive moment in the completion of detumescence in woman, and it is probable that the thick mucus, unlike the earlier more limpid secretion, which women are sometimes aware of after orgasm, is emitted from the womb at this time. This is, however, not absolutely certain. Some authorities regard

detumescence in women as accomplished in the pouring out of secretions, others in the rhythmic genital contractions; the sexual parts may, however, be copiously bathed in mucus for an indefinitely long period before the final stage of detumescence is achieved, and the rhythmic contractions are also taking place at a somewhat early period; in neither respect is there any obvious increase at the final moment of orgasm. In women this would seem to be more conspicuously a nervous manifestation than in men. On the subjective side it is very pronounced, with its feeling of relieved tension and agreeable repose--a moment when, as one woman expresses it, together with intense pleasure, there is, as it were, a floating up into a higher sphere, like the beginning of chloroform narcosis--but on the objective side this culminating moment is less easy to define.

Various observations and remarks made during the past two or three centuries by Bond, Valisneri, Dionis, Haller, Guenther, and Bischoff, tending to show a sucking action of the uterus in both women and other female animals, have been brought together by Litzmann in R. Wagner's *Handwoerterbuch der Physiologie* (1846, vol. iii, p. 53). Litzmann added an experience of his own: "I had an opportunity lately, while examining a young and very erethic woman, to observe how suddenly the uterus assumed a more erect position, and descended deeper in the pelvis; the lips of the womb became equal in length, the cervix rounded, softer, and more easily reached by the finger, and at the same time a high state of sexual excitement was revealed by the respiration and voice."

The general belief still remained, however, that the woman's part in conjugation is passive, and that it is entirely by the energy of the male organ and of the male sexual elements, the spermatozoa, that conjunction with the germ cell is attained. According to this theory, it was believed that the spermatozoa were, as Wilkinson expresses it, in a history of opinion on this question, "endowed with some sort of intuition or instinct; that they would turn in the direction of the os uteri, wading through the acid mucus of the vagina; travel patiently upward and around the vaginal portion of the uterus; enter the uterus and proceed onward in search of the waiting ovum." (A.D. Wilkinson, "Sterility in the Female," *Transactions of the Lincoln Medical Society*, Nebraska, 1896.)

About the year 1859 Fichstedt seems to have done something to

overthrow this theory by declaring his belief that the uterus was not, as commonly supposed, a passive organ in coitus, but was capable of sucking in the semen during the brief period of detumescence. Various authorities then began to bring forward arguments and observations in the same sense. Wernich, especially, directed attention to this point in 1872 in a paper on the erectile properties of the lower segment of the uterus ("Die Erectionsfahigkeit des untern Uterus-Abschnitts," *Beitraege zur Geburtshuelfe und Gynaekologie*, vol. i, p. 296). He made precise observations and came to the conclusion that owing to erectile properties in the neck of the uterus, this part of the womb elongates during congress and reaches down into the pelvis with an aspiratory movement, as if to meet the glans of the male. A little later, in a case of partial prolapse, Beck, in ignorance of Wernich's theory, was enabled to make a very precise observation of the action of the uterus during excitement. In this case the woman was sexually very excitable even under ordinary examination, and Beck carefully noted the phenomena that took place during the orgasm. "The os and cervix uteri," he states, "had been about as firm as usual, moderately hard and, generally speaking, in a natural and normal condition, with the external os closed to such an extent as to admit of the uterine probe with difficulty; but the instant that the height of excitement was at hand, the os opened itself to the extent of fully an inch, as nearly as my eye can judge, made five or six successive gasps as if it were drawing the external os into the cervix, each time powerfully, and, it seemed to me, with a regular rhythmical action, at the same time losing its former density and hardness and becoming quite soft to the touch. Upon the cessation of the action, as related, the os suddenly closed, the cervix again hardened itself, and the intense congestion was dissipated." (J.R. Beck, "How do the Spermatozoa Enter the Uterus?" *American Journal of Obstetrics*, 1874.) It would appear that in the early part of this final process of detumescence the action of the uterus is mainly one of contraction and ejaculation of any mucus that may be contained; Dr. Paul Munde has described "the gushing, almost in jets," of this mucus which he has observed in an erotic woman under a rather long digital and specular examination. (*American Journal of Obstetrics*, 1893.) It is during the latter part of detumescence, it would seem, and perhaps for a short time after the orgasm is over, that the action of the uterus is mainly aspiratory.

While the active part played by the womb in detumescence can no longer be questioned, it need not too hastily be assumed that the belief in the active movements of the spermatozoa must therefore be denied. The vigorous motility of the tadpole-like organisms is obvious to anyone who has ever seen fresh semen under the microscope; and if it is correct, as Clifton Edgar states, that the spermatozoa may retain their full activity in the female organs for at least seventeen days, they have ample time to exert their energies. The fact that impregnation sometimes occurs without rupture of the hymen is not decisive evidence that there has been no penetration, as the hymen may dilate without rupturing; but there seems no reason to doubt that conception has sometimes taken place when ejaculation has occurred without penetration; this is indicated in a fairly objective manner when, as has been occasionally observed, conception has occurred in women whose vaginas were so narrow as scarcely to admit the entrance of a goose-quill; such was the condition in the case of a pregnant woman brought forward by Roubaud. The stories, repeated in various books, of women who have conceived after homosexual relations with partners who had just left their husbands' beds are not therefore inherently impossible.[119] Janke quotes numerous cases in which there has been impregnation in virgins who have merely allowed the penis to be placed in contact with the vulva, the hymen remaining unruptured until delivery.[120]

It must be added, however, that even if the semen is effused merely at the mouth of the vagina, without actual penetration, the spermatozoa are still not entirely without any resource save their own motility in the task of reaching the ovum. As we have seen, it is not only the uterus which takes an active part in detumescence; the vagina also is in active movement, and it seems highly probable that, at all events in some women and under some circumstances, such movement favoring aspiration toward the womb may be communicated to the external mouth of the vagina.

Riolan (*_Anthropographia_*, 1626, p. 294) referred to the constriction and dilation of the vulva under the influence of sexual excitement. It is said that in Abyssinia women can, when adopting the straddling posture of coitus, by the movements of their own vaginal muscles alone, grasp the male organ and cause ejaculation, although the man remains passive. According to Lorion the Annamites, adopting the normal posture of coitus, introduce the penis when flaccid or only half erect, the contraction of the vaginal walls completing the process; the

penis is very small in this people. It is recognized by gynaecologists that the condition of vaginismus, in which there is spasmodic contraction of the vagina, making intercourse painful or impossible, is but a morbid exaggeration of the normal contraction which occurs in sexual excitement. Even in the absence of sexual excitement there is a vague affection, occurring in both married and unmarried women, and not, it would seem, necessarily hysterical, characterized by quivering or twitching of the vulva; I am told that this is popularly termed "flackering of the shape" in Yorkshire and "taittering of the lips" in Ireland. It may be added that quivering of the gluteal muscles also takes place during detumescence, and that in Indian medicine this is likewise regarded as a sign of sexual desire in women, apart from coitus.

A non-medical correspondent in Australia, W.J. Chidley, from whom I have received many communications on this subject, is strongly of opinion from his own observations that not only does the uterus take an active part in coitus, but that under natural conditions the vagina also plays an active part in the process. He was led to suspect such an action many years ago, as well by an experience of his own, as also by hearing from a young woman who met her lover after a long absence that by the excitement thus aroused a tape attached to the underclothes had been drawn into the vagina. Since then the confidences of various friends, together with observations of animals, have confirmed him in the view that the general belief that coitus must be effected by forcible entry of the male organ into a passive vagina is incorrect. He considers that under normal circumstances coitus should take place but rarely, and then only under the most favorable circumstances, perhaps exclusively in spring, and, most especially, only when the woman is ready for it. Then, when in the arms of the man she loves, the vagina, in sympathy with the active movements of the womb, becomes distended at the touch of the turgescient, but not fully erect, penis, "flashes open and draws in the male organ." "All animals," he adds, "have sexual intercourse by the male organ being drawn, not forced, into the female. I have been borne out in this by friends who have seen horses, camels, mules and other large animals in the coupling season. What is more absurd, for instance, than to say that an entire penetrates the mare? His penis is a sensitive, beautiful piece of mechanism, which brings its light head here and there

till it touches the right spot, when the mare, if ready, takes it in. An entire's penis could not penetrate anything; it is a curve, a beautiful curve which would easily bend. A bull's, again, is turned down at the end and, more palpably still, would fold on itself if pressed with force. The womb and vagina of a beautiful and healthy woman constitute a living, vital, moving organ, sensitive to a look, a word, a thought, a hand on the waist."

A well-known American author thus writes in confirmation of the foregoing view: "In nature the woman woos. When impassioned her vagina becomes erect and dilated, and so lubricated with abundant mucus to the lips that entrance is easy. This dilatation and erectile expansion of vagina withdraws the hymen so close to the walls that penetration need not tear it or cause pain. The more muscular, primitive and healthy the woman the tougher and less sensitive the hymen, and the less likely to break or bleed. I think one great function of the foreskin also is to moisten the glans, so that it can be lubricated for entrance, and then to retract, moist side out, to make entrance still easier. I think that in nature the glans penetrates within the labia, is withstood a moment, vibrating, and then all resistance is withdrawn by a sudden 'flashing open' of the gates, permitting easy entrance, and that the sudden giving up of resistance, and substitution of welcome, with its instantaneous deep entrance, causes an almost immediate male orgasm (the thrill being irresistibly exciting). Certainly this is the process as observed in horses, cattle, goats, etc., and it seems likely something analogous is natural in man."

While it is easily possible to carry to excess a view which would make the woman rather than the man the active agent in coitus (and it may be recalled that in the Cebidae the penis, as also the clitoris, is furnished with a bone), there is probably an element of truth in the belief that the vagina shares in the active part which, there can now be little doubt, is played by the uterus in detumescence. Such a view certainly enables us to understand how it is that semen effused on the exterior sexual organs can be conveyed to the uterus.

It was indeed the failure to understand the vital activity of the semen and the feminine genital canal, co-operating together

towards the junction of sperm cell and germ cell, which for so long stood in the way of the proper understanding of conception. Even the genius of Harvey, which had grappled successfully with the problem of the circulation, failed in the attempt to comprehend the problem of generation. Mainly on account of this difficulty, he was unable to see how the male element could possibly enter the uterus, although he devoted much observation and study to the question. Writing of the uterus of the doe after copulation, he says: "I began to doubt, to ask myself whether the semen of the male could by any possibility make its way by attraction or injection to the seat of conception, and repeated examination led me to the conclusion that none of the semen reached this seat." (*_De-Generazione Animalium_*, Exercise lxvii.) "The woman," he finally concluded, "after contact with the spermatic fluid *_in coitu_*, seems to receive an influence and become fecundated without the co-operation of any sensible corporeal agent, in the same way as iron touched by the magnet is endowed with its powers."

Although the specifically sexual muscular process of detumescence in women--as distinguished from the general muscular phenomena of sexual excitement which may be fairly obvious--is thus seen to be somewhat complex and obscure, in women as well as in men detumescence is a convulsion which discharges a slowly accumulated store of nervous force. In women also, as in men, the motor discharge is directed to a specific end--the intromission of the semen in the one sex, its reception in the other. In both sexes the sexual orgasm and the pleasure and satisfaction associated with it, involve, as their most essential element, the motor activity of the sexual sphere.[121]

The active co-operation of the female organs in detumescence is probably indicated by the difficulty which is experienced in achieving conception by the artificial injection of semen. Marion Sims stated in 1866, in *_Clinical Notes on Uterine Surgery_*, that in 55 injections in six women he had only once been successful; he believed that that was the only case at that time on record. Jacobi had, however, practiced artificial fecundation in animals (in 1700) and John Hunter in man. See Gould and Pyle, *_Anomalies and Curiosities of Medicine_*, p. 43; also Janke (*_Die Willkuerliche Hervorbringen des Geschlechts_*, pp. 230 et seq.) who discusses the question of artificial fecundation and brings together a mass of data.

The facial expression when tumescence is completed is marked by a high degree of energy in men and of loveliness in women. At this moment, when the culminating act of life is about to be accomplished, the individual thus reaches his supreme state of radiant beauty. The color is heightened, the eyes are larger and brighter, the facial muscles are more tense, so that in mature individuals any wrinkles disappear and youthfulness returns.

At the beginning of detumescence the features are frequently more discomposed. There is a general expression of eager receptivity to sensory impressions. The dilatation of the pupils, the expansion of the nostrils, the tendency to salivation and to movements of the tongue, all go to make up a picture which indicates an approaching gratification of sensory desires; it is significant that in some animals there is at this moment erection of the ears.[122] There is sometimes a tendency to utter broken and meaningless words, and it is noted that sometimes women have called out on their mothers.[123] The dilatation of the pupils produces photophobia, and in the course of detumescence the eyes are frequently closed from this cause. At the beginning of sexual excitement, Vaschide and Vurpas have observed, tonicity of the eye-muscles seems to increase; the elevators of the upper lids contract, so that the eyes look larger and their mobility and brightness are heightened; with the increase of muscular tonicity strabismus occurs, owing to the greater strength of the muscles that carry the eyes inward.[124]

The facial expression which marks the culmination of tumescence, and the approach of detumescence is that which is generally expressive of joy. In an interesting psycho-physical study of the emotion of joy, Dearborn thus summarizes its characteristics: "The eyes are brighter and the upper eyelid elevated, as also are the brows, the skin over the glabella, the upper lip and the corners of the mouth, while the skin at the outer canthi of the eye is puckered. The nostrils are moderately dilated, the tongue slightly extended and the cheeks somewhat expanded, while in persons with largely developed pinnae muscles the ears tend somewhat to incline forwards. The whole arterial system is dilated, with consequent blushing from this effect on the dermal capillaries of the face, neck, scalp and hands, and sometimes more extensively even; from the same cause the eyes slightly bulge. The whole glandular system likewise is stimulated, causing the secretions,--gastric, salivary, lachrymal, sudoral, mammary,

genital, etc.--to be increased, with the resulting rise of temperature and increase in the katabolism generally. Volubility is almost regularly increased, and is, indeed, one of the most sensitive and constant of the correlations in emotional delight.... Pleasantness is correlated in living organisms by vascular, muscular and glandular extension or expansion, both literal and figurative." (G. Dearborn, "The Emotion of Joy," Psychological Review Monograph Supplements, vol. ii, No. 5, p. 62.) All these signs of joy appear to occur at some stage of the process of sexual excitement.

In some monkeys it would seem that the muscular movement which in man has become the smile is the characteristic facial expression of sexual tumescence or courtship. Discussing the facial expression of pleasure in children, S.S. Buckman has the following remarks: "There is one point in such expression which has not received due consideration, namely, the raising of lumps of flesh each side of the nose as an indication of pleasure. Accompanying this may be seen small furrows, both in children and adults, running from the eyes somewhat obliquely towards the nose. What these characters indicate may be learned from the male mandril, whose face, particularly in the breeding season, shows colored fleshy prominences each side of the nose, with conspicuous furrows and ridges. In the male mandril these characters have been developed because, being an unmistakable sign of sexual ardor, they gave the female particular evidence of sexual feelings. Thus such characters would come to be recognized as habitually symptomatic of pleasurable feelings. Finding similar features in human beings, and particularly in children, though not developed in the same degree, we may assume that in our monkey-like ancestors facial characters similar to those of the mandril were developed, though to a less extent, and that they were symptomatic of pleasure, because connected with the period of courtship. Then they became conventionalized as pleasurable symptoms." (S.S. Buckmann, "Human Babies: What They Teach," Nature, July 5, 1900.) If this view is accepted, it may be said that the smile, having in man become a generalized sign of amiability, has no longer any special sexual significance. It is true that a faint and involuntary smile is often associated with the later stages of tumescence, but this is usually lost during detumescence, and may even give place to an expression of ferocity.

When we have realized how profound is the organic convulsion involved by the process of detumescence, and how great the general motor excitement involved, we can understand how it is that very serious effects may follow coitus. Even in animals this is sometimes the case. Young bulls and stallions have fallen in a faint after the first congress; boars may be seriously affected in a similar way; mares have been known even to fall dead.[125] In the human species, and especially in men--probably, as Bryan Robinson remarks, because women are protected by the greater slowness with which detumescence occurs in them--not only death itself, but innumerable disorders and accidents have been known to follow immediately after coitus, these results being mainly due to the vascular and muscular excitement involved by the processes of detumescence. Fainting, vomiting, urination, defaecation have been noted as occurring in young men after a first coitus. Epilepsy has been not infrequently recorded. Lesions of various organs, even rupture of the spleen, have sometimes taken place. In men of mature age the arteries have at times been unable to resist the high blood-pressure, and cerebral haemorrhage with paralysis has occurred. In elderly men the excitement of intercourse with strange women has sometimes caused death, and various cases are known of eminent persons who have thus died in the arms of young wives or of prostitutes.[126]

These morbid results, are, however, very exceptional. They usually occur in persons who are abnormally sensitive, or who have imprudently transgressed the obvious rules of sexual hygiene. Detumescence is so profoundly natural a process; it is so deeply and intimately a function of the organism, that it is frequently harmless even when the bodily condition is far from absolutely sound. Its usual results, under favorable circumstances, are entirely beneficial. In men there normally supervenes, together with the relief from the prolonged tension of tumescence, with the muscular repose and falling blood-pressure,[127] a sense of profound satisfaction, a glow of diffused well-being,[128] perhaps an agreeable lassitude, occasionally also a sense of mental liberation from an overmastering obsession. Under reasonably happy circumstances there is no pain, or exhaustion, or sadness, or emotional revulsion. The happy lover's attitude toward his partner is not expressed by the well-known Sonnet (CXXIX) of Shakespeare:--

"Past reason hunted, and no sooner had
Past reason hated."

He feels rather with Boccaccio that the kissed mouth loses not its charm,

"Bocca baciata non perde ventura."

In women the results of detumescence are the same, except that the tendency to lassitude is not marked unless the act has been several times repeated; there is a sensation of repose and self-assurance, and often an accession of free and joyous energy. After completely satisfactory detumescence she may experience a feeling as of intoxication, lasting for several hours, an intoxication that is followed by no evil reaction.

Such, so far as our present vague and imperfect knowledge extends, are the main features in the process of detumescence. In the future, without doubt, we shall learn to know more precisely a process which has been so supremely important in the life of man and of his ancestors.

FOOTNOTES:

[98] The elements furnished by the sense of touch in sexual selection have been discussed in the first section of the previous volume of these *_Studies_*.

[99] See Appendix A. "The Origins of the Kiss," in the previous volume.

[101] Guibaut, *_Traite Clinique des Maladies des Femmes_*, p. 242. Adler discusses the sexual secretions in women and their significance, *_Die Mangelhafte Geschlechtsempfindung des Weibes_*, pp. 19-26.

[102] In some parts of the world this is further aided by artificial means. Thus it is stated by Riedel (as quoted by Ploss and Bartels) that in the Gorong Archipelago the bridegroom, before the first coitus, anoints the bride's pudenda with an ointment containing opium, musk, etc. I have been told of an English bride who was instructed by her mother to use a candle for the same purpose.

[103] *_Parthenologia_*, pp. 302, et seq.

[104] The connection of this mucous flow with sexual emotion was discussed early in the eighteenth century by Schurig in his *_Gynaecologia_*, pp. 8-11;

it is frequently passed over by more modern writers.

[105] The drawing is reproduced by Ploss and Bartels, *_Das Weib_*, vol. i, Chapter XVII; many facts bearing on the ethnography of coitus are brought together in this chapter.

[106] Onanoff (Paris Societe de Biologie, May 3, 1890) proposed the name of bulbo-cavernous reflex for the smart contraction of the ischio-and bulbo-cavernosus muscles (erector penis and accelerator urinae) produced by mechanical excitation of the glans. This reflex is clinically elicited by placing the index-finger of the left hand on the region of the bulb while the right hand rapidly rubs the dorsal surface of the glands with the edge of a piece of paper or lightly pinches the mucous membrane; a twitching of the region of the bulb is then perceived. This reflex is always present in healthy adult subjects and indicates the integrity of the physical mechanism of detumescence. It has been described by Hughes. (C.H. Hughes, "The Virile or Bulbo-cavernous Reflex," *_Alienist and Neurologist_*, January, 1898.)

[109] The influence of impeded respiration in exciting more or less perverted forms of sexual gratification has been discussed in a section of "Love and Pain" in the third volume of these *_Studies_*.

[110] See, e.g., the experiments of Obici on this point, *_Revista Sperimentale di Freniatria_*, 1903, pp. 689, et seq.

[111] Summarized in *_Archives d'Anthropologie Criminelle_*, March, 1903, p. 188. The tendency to closure of the eyes noted by Roubaud, to avoid contact of the light, indicates dilatation of the pupils, for which we need not seek other explanation than the general tendency of all peripheral stimulation, according to Schiff's law, to produce such dilatation.

[112] Vaschide and Vurpas, "Du Coefficient Sexuel de l'Impulsion Musicale," *_Archives de Neurologie_*, May, 1904.

[113] In the *_Priapeia_* is an inscription which has thus been translated:--

"You see this organ, after which I'm called
And which is my certificate, is humid;
This moisture is not dew nor drops of rain,
It is the outcome of sweet memory,
Recalling thoughts of a complacent maid."

The translator supposes that semen is referred to, but without doubt the allusion is to the theologians' _distillatio_.

[114] A woman of 30, normal and intelligent, after conversing on love and passion, and then listening to the music of Grieg and Schumann, felt real and strong sexual excitement, increased by memories recalled by the presence of a sympathetic person. When then tested by the dynamometer the average of ten efforts with the right hand was found to be 28.2 (her normal average being 31.1) and with the left hand 28.0 (the normal being 30.0). There was, however, great variability in the individual pressures which sometimes equaled and even exceeded the subject's normal efforts. The voluntary muscles are thus in harmony with the approaching general sexual avalanche. (Vaschide and Vurpas, "Quelques Donnees Experimentales sur l'Influence de l'Excitation Sexuelle," _Archivio di Psichiatria_, 1903, fasc. v-vi.)

[122] Fere, *Pathologie des Emotions*, p. 51.

[123] This is an instinctive impulse under all strong emotion in primitive persons. "The Australian Dieri," says A.W. Howitt (*Journal Anthropological Institute*, August, 1890), "when in pain or grief cry out for their father or mother."

[124] Vaschide and Vurpas, *Archives de Neurologie*, May, 1904.

[125] F.B. Robinson, *New York Medical Journal*, March 11, 1893.

[126] Fere deals fully with the various morbid results which may follow coitus, *L' Instinct Sexuel*, Chapter X; id., *Pathologie des Emotions*, p. 99.

[127] With regard to the relationship of detumescence to the blood-pressure Haig remarks: "I think that as the sexual act produces low and falling blood-pressure, it will of necessity relieve conditions which are due to high and rising blood-pressure, such, for instance, as mental depression and bad temper; and, unless my observation deceives me, we have here a connection between conditions of high blood-pressure, with mental and bodily depression, and the act of masturbation, for this act will relieve those conditions, and will tend to be practiced for this purpose." (A. Haig, *Uric Acid*, sixth edition, p. 154.)

[128] A medical correspondent speaks of subjective feelings of temperature coming over the body from 20 to 24 hours after congress, and marked by sensations of cooling of body and glow of cheeks. In another case, though lassitude appears on the second day after congress, the first day after is marked by a notable increase in mental and physical activity.

III.

The Constituents of Semen--Function of the Prostate--The Properties of

Semen--Aphrodisiacs--Alcohol, Opium, etc.--Anaphrodisiacs--The Stimulant Influence of Semen in Coitus--The Internal Effects of Testicular Secretions--The Influence of Ovarian Secretion.

The germ cell never comes into the sphere of consciousness and cannot therefore concern us in the psychological study of the phenomena of the sexual instinct. But it is otherwise with the sperm cell, and the seminal fluid has a relationship, both direct and indirect, to psychic phenomena which it is now necessary to discuss.

While the spermatozoa are formed in the glandular tissue of the testes, the seminal fluid as finally emitted in detumescence is not a purely testicular product, but is formed by mixture with the fluids poured out at or before detumescence by various glands which open into the urethra, and notably the prostate.[129] This is a purely sexual gland, which in animals only becomes large and active during the breeding season, and may even be hardly distinguishable at other times; moreover, if the testes are removed in infancy, the prostate remains rudimentary, so that during recent years removal of the testes has been widely advocated and practiced for that hypertrophy of the prostate which is sometimes a distressing ailment of old age. It is the prostatic fluid, according to Fuerbringer, which imparts its characteristic odor to semen. It appears, however, to be the main function of the prostatic fluid to arouse and maintain the motility of the spermatozoa; before meeting the prostatic fluid the spermatozoa are motionless; that fluid seems to furnish a thinner medium in which they for the first time gain their full vitality.[130]

When at length the semen is ejaculated, it contains various substances which may be separated from it,[131] and possesses various qualities, some of which have only lately been investigated, while others have evidently been known to mankind from a very early period. "When held for some time in the mouth," remarked John Hunter, "it produces a warmth similar to spices, which lasts some time." [132] Possibly this fact first suggested that semen might, when ingested, possess valuable stimulant qualities, a discovery which has been made by various savages, notably by the Australian aborigines, who, in many parts of Australia, administer a potion of semen to dying or feeble members of the tribe.[133] It is perhaps noteworthy that in Central Africa the testes of the goat are consumed as an aphrodisiac.[134] In eighteenth century Europe, Schurig, in his *Spermatologia*, still found it necessary to discuss at considerable length the possible medical properties of human semen, giving many

prescriptions which contained it.[135] The stimulation produced by the ingestion of semen would appear to form in some cases a part of the attraction exerted by _fellatio_; De Sade emphasized this point; and in a case recorded by Howard semen appears to have acted as a stimulant for which the craving was as irresistible as is that for alcohol in dipsomania.[136]

It must be remembered that the early history of this subject is more or less inextricably commingled with folk-lore practices of magical origin, not necessarily founded on actual observation of the physiological effects of consuming the semen or testes. Thus, according to W.H. Pearse (_Scalpel_, December, 1897), it is the custom in Cornwall for country maids to eat the testicles of the young male lambs when they are castrated in the spring, the survival, probably, of a very ancient religious cult. (I have not myself been able to hear of this custom in Cornwall.) In Burchard's Penitential (Cap. CLIV, Wasserschleben, op. cit., p. 660) seven years' penance is assigned to the woman who swallows her husband's semen to make him love her more. In the seventeenth century (as shown in William Salmon's _London Dispensatory_, 1678) semen was still considered to be good against witchcraft and also valuable as a love-philter, in which latter capacity its use still survives. (Bourke, _Scatalogic Rites_, pp. 343, 355.) In an earlier age (Picart, quoted by Crawley, _The Mystic Rose_, p. 109) the Manichaeans, it is said, sprinkled their eucharistic bread with human semen, a custom followed by the Albigenses.

The belief, perhaps founded in experience, that semen possesses medical and stimulant virtues was doubtless fortified by the ancient opinion that the spinal cord is the source of this fluid. This was not only held by the highest medical authorities in Greece, but also in India and Persia.

The semen is thus a natural stimulant, a physiological aphrodisiac, the type of a class of drugs which have been known and cultivated in all parts of the world from time immemorial. (Dufour has discussed the aphrodisiacs used in ancient Rome, _Histoire de la Prostitution_, vol. II, ch. 21.) It would be vain to attempt to enumerate all the foods and medicaments to which has been ascribed an influence in heightening the sexual impulse. (Thus, in the sixteenth century, aphrodisiacal virtues were attributed to an immense variety of foods by Liebault in his

Thresor des Remedies Secrets pour les Maladies des Femmes, 1585, pp. 104, et seq.) A large number of them certainly have no such effect at all, but have obtained this credit either on some magical ground or from a mistaken association. Thus the potato, when first introduced from America, had the reputation of being a powerful aphrodisiac, and the Elizabethan dramatists contain many references to this supposed virtue. As we know, potatoes, even when taken in the largest doses, have not the slightest aphrodisiac effect, and the Irish peasantry, whose diet consists very largely of potatoes, are even regarded as possessing an unusually small measure of sexual feeling. It is probable that the mistake arose from the fact that potatoes were originally a luxury, and luxuries frequently tend to be regarded as aphrodisiacs, since they are consumed under circumstances which tend to arouse the sexual desires. It is possible also that, as has been plausibly suggested, the misunderstanding may have been due to sailors--the first to be familiar with the potato--who attributed to this particular element of their diet ashore the generally stimulating qualities of their life in port. The eryngo (_Eryngium maritimum_), or sea holly, which also had an erotic reputation in Elizabethan times, may well have acquired it in the same way. Many other vegetables have a similar reputation, which they still retain. Thus onions are regarded as aphrodisiacal, and were so regarded by the Greeks, as we learn from Aristophanes. It is noteworthy that Marro, a reliable observer, has found that in Italy, both in prisons and asylums, lascivious people are fond of onions (_La Puberta_, p. 297), and it may perhaps be worth while to recall the observation of Serieux that in a woman in whom the sexual instinct only awoke in middle age there was a horror of leeks. In some countries, and especially in Belgium, celery is popularly looked upon as a sexual stimulant. Various condiments, again, have the same reputation, perhaps because they are hot and because sexual desire is regarded, rightly enough, as a kind of heat. Fish--skate, for instance, and notably oysters and other shellfish--are very widely regarded as aphrodisiacs, and Kisch attributes this property to caviar. It is probable that all these and other foods which have obtained this reputation, in so far as they have any action whatever on the sexual appetite, only possess it by virtue of their generally nutritious and stimulating qualities, and not by the presence of any special principle having a selective action on the sexual sphere. A beefsteak is probably as powerful a sexual stimulant as any food;

a nutritious food, however, which is at the same time easily digestible, and thus requiring less expenditure of energy for its absorption, may well exert a specially rapid and conspicuous stimulant effect. But it is not possible to draw a line, and, as Aquinas long since said, if we wish to maintain ourselves in a state of purity we shall fear even an immoderate use of bread and water.

More definitely aphrodisiacal effects are produced by drugs, and especially by drugs which in large doses are poisons. The aphrodisiac with the widest popular reputation is cantharides, but its sexually exciting effects are merely an accidental result of its action in causing inflammation of the genito-urinary passage, and it is both an uncertain and a dangerous result, except in skillful hands and when administered in small doses. Nux vomica (with its alkaloid strychnia), by virtue of its special action on the spinal cord, has a notably pronounced effect in heightening the irritability of the spinal ejaculatory center, though it by no means necessarily exerts any strengthening influence. Alcohol exerts a sexually exciting effect, but in a different manner; it produces little stimulation of the cord and, indeed, even paralyzes the lumbar sexual center in large doses, but it has an influence on the peripheral nerve-endings and on the skin, and also on the cerebral centers, tending to arouse desire and to diminish inhibition. In this latter way, as Adler remarks, it may, in small doses, under some circumstances, be beneficial in men with an excessive nervousness or dread of coitus, and women, in whom orgasm has been difficult to reach, have frequently found this facilitated by some previous indulgence in alcohol. The aphrodisiac effect of alcohol seems specially marked on women. But against the use of alcohol as an aphrodisiac it must be remembered that it is far from being a tonic to detumescence, at all events in men, and that there is much evidence tending to show that not only chronic alcoholism, but even procreation during intoxication is perilous to the offspring (see, e.g., Andriezen, *Journal of Mental Science*, January, 1905, and cf. W.C. Sullivan, "Alcoholism and Suicidal Impulses," *ib.*, April, 1898, p. 268); it may be added that Bunge has found a very high proportion of cases of immoderate use of alcohol in the fathers of women unable to suckle their infants (G. von Bunge, *Die Zunehmende Unfaehigkeit der Frauen ihre Kinder zu Stillen*, 1903) while even an

approximation to the drunken state is far from being a desirable prelude to the creation of a new human being. It is obvious that those who wish, for any reason, to cultivate a strict chastity of thought and feeling would do well to avoid alcohol altogether, or only in its lightest forms and in moderation. The aphrodisiacal effects of wine have long been known; Ovid refers to them (e.g., *Ars Am.*, Bk. III, 765). Clement of Alexandria, who was something of a man of science as well as a Christian moralist, points out the influence of wine in producing lasciviousness and sexual precocity. (*Paedagogus*, Bk. II, Chapter II). Chaucer makes the Wife of Bath say in the Wife of Bath's Prologue:--

"And, after wyn, on Venus moste [needs] I thinke:
For al so siken as cold engendreth hayl,
A likerous mouth moste have a likerous tayl,
In womman vinolent is no defense,
This knowen lechours by experience."

Alcohol, as Chaucer pointed out, comes to the aid of the man, who is unscrupulous in his efforts to overcome a woman, and this not merely by virtue of its aphrodisiacal effects, and the apparently special influence which it seems to exert on women, but also because it lulls the mental and emotional characteristics which are the guardians of personality. A correspondent who has questioned on this point a number of prostitutes he has known, writes: "Their accounts of the first fall were nearly always the same. They got to know a 'gentleman,' and on one occasion they drank too much; before they quite realized what was happening they were no longer virgins." "In the mental areas, under the influence of alcohol," Schmiedeberg remarks (in his *Elements of Pharmacology*), "the finer degrees of observation, judgment, and reflection are the first to disappear, while the remaining mental functions remain in a normal condition. The soldier acts more boldly because he notices dangers less and reflects over them less; the orator does not allow himself to be influenced by any disturbing side-considerations as to his audience, hence he speaks more freely and spiritedly; self-consciousness is lost to a very great extent, and many are astounded at the ease with which they can express their thoughts, and at the acuteness of their judgment in matters which, when they are perfectly sober, with difficulty reach their minds; and then afterwards they are ashamed at their mistakes."

The action of opium in small doses is also to some extent aphrodisiacal; it slightly stimulates both the brain and the spinal cord, and has sensory effects on the skin like alcohol; these effects are favored by the state of agreeable dreaminess it produces. In the seventeenth century Venette (*_La Generation de l'Homme_*, Part II, Chapter V) strongly recommended small doses of opium, then little known, for this purpose; he had himself, he says, in illness experienced its joys, "a shadow of those of heaven." In India opium (as well as *cannabis indica*) has long been a not uncommon aphrodisiac; it is specially used to diminish local sensibility, delaying the orgasm and thus prolonging the sexual act. (W.D. Sutherland, "De Impotentia," *_Indian Medical Gazette_*, January, 1900). Its more direct and stimulating influence on the sexual emotions seems indicated by the statement that prostitutes are found standing outside the opium-smoking dens of Bombay, but not outside the neighboring liquor shops. (G.C. Lucas, *_Lancet_*, February 2, 1884.) Like alcohol, opium seems to have a marked aphrodisiacal effect on women. The case is recorded of a mentally deranged girl, with no nymphomania though she masturbated, who on taking small doses of opium at once showed signs of nymphomania, following men about, etc. (*_American Journal Obstetrics_*, May, 1901, p. 74.) It may well be believed that opium acts beneficially in men when the ejaculatory centers are weak but irritable; but its actions are too widespread over the organism to make it in any degree a valuable aphrodisiac. Various other drugs have more or less reputation as aphrodisiacs; thus bromide of gold, a nervous and glandular stimulant, is said to have as one of its effects a heightening of sexual feeling. Yohimbin, an alkaloid derived from the West African Yohimbe tree, has obtained considerable repute during recent years in the treatment of impotence; in some cases (see, e.g., Toff's results, summarized in *_British Medical Journal_*, February 18, 1905) it has produced good results, apparently by increasing the blood supply to the sexual organs, but has not been successful in all cases or in all hands. It must always be remembered that in cases of psychical impotence suggestion necessarily exerts a beneficial influence, and this may work through any drug or merely with the aid of bread pills. All exercise, often even walking, may be a sexual stimulant, and it is scarcely necessary to add that powerful stimulation of the skin in the sexual sphere, and more especially of the nates, is often a more effective aphrodisiac

than any drug, whether the irritation is purely mechanical, as by flogging, or mechanico-chemical, as by urtication or the application of nettles. Among the Malays (with whom both men and women often use a variety of plants as aphrodisiacs, according to Vaughan Stevens) Breitenstein states (*_21 Jahre in India_, Theil I, p. 228*) that both massage and gymnastics are used to increase sexual powers. The local application of electricity is one of the most powerful of aphrodisiacs, and McMordie found on applying one pole to a uterine sound in the uterus and the other to the abdominal wall that in the majority of healthy women the orgasm occurred.

Among anaphrodisiacs, or sexual sedatives, bromide of potassium, by virtue of its antidotal relationship to strychnia, is one of the drugs whose action is most definite, though, while it dulls sexual desire, it also dulls all the nervous and cerebral activities. Camphor has an ancient reputation as an anaphrodisiac, and its use in this respect was known to the Arabs (as may be seen by a reference to it in the *_Perfumed Garden_*), while, as Hyrtl mentions (*loc. cit. ii, p. 94*), rue (*_Ruta graveolens_*) was considered a sexual sedative by the monks of old, who on this account assiduously cultivated it in their cloister gardens to make *_vinum rutae_*. Recently heroin in large doses (see, e.g., Becker, *_Berliner Klinische Wochenschrift_, November 23, 1903*) has been found to have a useful effect in this direction. It may be doubted, however, whether there is any satisfactory and reliable anaphrodisiac. Charcot, indeed, it is said, used to declare that the only anaphrodisiac in which he had any confidence was that used by the uncle of Heloise in the case of Abelard. "*_Cela_* (he would add with a grim smile) *_tranche la difficulte_*."

If semen is a stimulant when ingested, it is easy to suppose that it may exert a similar action on the woman who receives it into the vagina in normal sexual congress. It is by no means improbable that, as Mattei argued in 1878, this is actually the case. It is known that the vagina possesses considerable absorptive power. Thus Coen and Levi, among others, have shown that if a tampon soaked in a solution of iodine is introduced into the vagina, iodine will be found in the urine within an hour. And the same is true of various other substances.[137] If the vagina absorbs drugs it probably absorbs semen. Toff, of Braila (Roumania), who attaches much importance to such absorption, considers that it must be analogous to the

ingestion of organic extractives. It is due to this influence, he believes, that weak and anaemic girls so often become full-blooded and robust after marriage, and lose their nervous tendencies and shyness.[138]

It is, however, most certainly a mistake to suppose that the beneficial influence of coitus on women is exclusively, or even mainly, dependent upon the absorption of semen. This is conclusively demonstrated by the fact that such beneficial influence is exerted, and in full measure, even when all precautions have been taken to avoid any contact with the semen. In so far as *_coitus reservatus_* or *_interruptus_* may lead to haste or discomfort which prevents satisfactory orgasm on the part of the woman, it is without doubt a cause of defective detumescence and incomplete satisfaction. But if orgasm is complete the beneficial effects of coitus follow even if there has been no possibility of the absorption of semen. Even after *_coitus interruptus_*, if it can be prolonged for a period long enough for the woman to attain full and complete satisfaction, she is enabled to experience what she may describe as a feeling of intoxication, lasting for several hours. It is in the action of the orgasm itself, and the vascular, secretory, and metabolic activities set up by the psychic and nervous influence of coitus with a beloved person, that we must seek the chief key to the effects produced by coitus on women, however these effects may possibly be still further heightened by the actual absorption of semen.[139]

The positive action of semen, or rather of the testicular products, has been much investigated during recent years, and appears on the whole to be demonstrated. The notable discovery by Brown-Sequard, a quarter of a century ago, that the ingestion of the testicular juices in states of debility and senility acted as a beneficial stimulant and tonic, opened the way to a new field of therapeutics. Many investigators in various countries have found that testicular extracts, and more especially the spermin as studied by Poehl,[140] and by him regarded as a positive katalysator or accelerator of metabolic processes, exert a real influence in giving tone to the heart and other muscles, and in improving the metabolism of the tissues even when all influences of mental suggestion have been excluded.[141]

As the ovaries are strictly analogous to the testes, it was surmised that ovarian extract might prove a drug equally valuable with testicular products. As a matter of fact, ovarian extract, in the form of ovarin, etc., would seem to have proved beneficial in various disorders, more especially in anaemia and in troubles

due to the artificial menopause. In most conditions, however, in which it has been employed the results are doubtful or uncertain, and some authorities believe that the influence of suggestion plays a considerable part here.

There is, however, another use which is subserved by the testicular products, a use which may indeed be said to be implied in those uses to which reference has already been made, but is yet historically the latest to be realized and studied. It was not until 1869 that Brown-Sequard first suggested that an important secretion was elaborated by the ductless glands and received into the circulation, but that suggestion proved to be epoch-making. If these glandular secretions are so valuable when administered as drugs to other persons, must they not be of far greater value when naturally secreted and poured out into the circulation in the living body? It is now generally believed, on the basis of a large and various body of evidence, that this is undoubtedly so. In a very crude form, indeed, this belief is by no means modern. In opposition to the old writers who were inclined to regard the semen as an excretion which it was beneficial to expel, there were other ancient authorities who argued that it was beneficial to retain it as being a vital fluid which, if reabsorbed, served to invigorate the body. The great physiologist, Haller, in the middle of the eighteenth century, came very near to the modern doctrine when he stated in his Elements of Physiology that the sperm accumulated in the seminal vesicles is pumped back into the blood, and thus produces the beard and the hair together with the other surprising changes of puberty which are absent in the eunuch. The reabsorption of semen can scarcely be said to be a part of the modern physiological doctrine, but it is at least now generally held that the testes secrete substances which pass into the circulation and are of immense importance in the development of the organism.

The experiments of Shattock and Seligmann indicate that the semen and its reabsorption in the seminal vesicles, or the nervous reactions produced by its presence, can have no part in the formation of secondary sexual characters. These investigators occluded the vas deferens in sheep by ligature, at an early age, rendering them later sterile though not impotent. The secondary sexual characters appeared as in ordinary sheep. Spermatogenesis, these inquirers conclude, may be the initial factor, but the results must be attributed to the elaboration by the testicles of an internal secretion and its absorption into the general circulation.[142]

When animals are castrated there is enlargement of the ductless glands in

the body, notably the thyroid and the suprarenal capsules.[143] It is evident, therefore, that the secretions of these ductless glands are in some degree compensatory to those of the testes. But this compensatory action is inadequate to produce any sexual development in the absence of the testes.

We see, therefore, how extremely important is the function of the testis. Its significance is not alone for the race, it is not simply concerned with the formation of the spermatozoa which share equally with the ova the honor of making the mankind of the future. It also has a separate and distinct function which has reference to the individual. It elaborates those internal secretions which stimulate and maintain the physical and mental characters, constituting all that is most masculine in the male animal, all that makes the man in distinction from the eunuch. Among various primitive peoples, including those of the European race whence we ourselves spring, the most solemn form of oath was sworn by placing the hand on the testes, dimly recognized as the most sacred part of the body. A crude and passing phase of civilization has ignorantly cast ignominy upon the sexual organs; the more primitive belief is now justified by our advancing knowledge.

In these as in other respects the ovaries are precisely analogous to the testes. They not only form the ova, but they elaborate for internal use a secretion which develops and maintains the special physical and mental qualities of womanhood, as the testicular secretion those of manhood. Moreover, as Cecca and Zappi found, removal of the ovaries has exactly the same effect on the abnormal development of the other ductless glands as has removal of the testes. It is of interest to point out that the internal secretion of the ovaries and its important functions seem to have been suggested before any other secretion than the sperm was attributed to the testes. Early in the nineteenth century Cabanis argued ("De l'Influence des Sexes sur le Caractere des Idees et des Affections Morales," _Rapport du Physique et du Moral de l'Homme_, 1824, vol. ii, p. 18) that the ovaries are secreting glands, forming a "particular humor" which is reabsorbed into the blood and imparts excitations which are felt by the whole system and all its organs.

FOOTNOTES:

[129] The composite character of the semen was recognized by various old authors, some of whom said, (e.g., Wharton) that it had three constituents, which they usually considered to be: (1) The noblest and most essential part, from the testicles; (2) a watery element from the vesiculae; (3) an oily element from the prostate. Schurig, *_Spermatologia_*, 1720, p. 17.

[138] E. Toff, "Uber Impraegnierung," *_Zentralblatt fuer Gynaekologie_*, April, 1903. In a similar but somewhat more precise manner Dufougere has argued ("La Chlorose, ses rapports avec le mariage, son traitement par le liquide orchitique," These de Bordeaux, 1902) that semen when absorbed by the vagina stimulates the secretion of the ovaries and thus exerts an influence over the blood in anaemia; in this way he seeks to explain why it is that coitus is the best treatment for chlorosis.

[139] In this connection I may refer to an interesting and suggestive paper by Harry Campbell on "The Craving for Stimulants" (*_Lancet_*, October 21, 1899). No reference is made to coitus, but the author discusses stimulants as normal and beneficial products of the organism, and deals

with the nature of the "physiological intoxication" they produce.

[140] Spermin was first discovered in the sperm by Schreiner in 1878; it has also been found in the thyroid, ovaries and various other glands. "The spermin secreting and elaborating organs," Howard Kelly remarks (*British Medical Journal*, January 29, 1898), "may be called the apothecaries' of the body, secreting many important medicaments, much more active and more accurately representing its true wants than artificially administered drugs."

IV.

The Aptitude for Detumescence--Is There an Erotic Temperament?--The Available Standards of Comparison--Characteristics of the Castrated--Characteristics of Puberty--Characteristics of the State of Detumescence--Shortness of Stature--Development of the Secondary Sexual Characters--Deep Voice--Bright Eyes--Glandular Activity--Everted Lips--Pigmentation--Profuse Hair--Dubious Significance of Many of These Characters.

What, if any, are the indications which the body generally may furnish as to the individual's aptitude and vigor for the orgasm of detumescence? Is there an erotic temperament outwardly and visibly displayed? That is a question which has often occupied those who have sought to penetrate the more intimate mysteries of human nature, and since we are here concerned with human beings in their relationship to the process of detumescence, we cannot altogether pass over this question, difficult as it is to discuss

it with precision.

The old physiognomists showed much confidence in dealing with the matter. Possibly they had more opportunities for observation than we have, since they often wrote in days when life was lived more nakedly than among ourselves, but their descriptions, while sometimes showing much insight, are inextricably mixed up with false science and superstition.

In the *_De Secretis Mulierum_*, wrongly attributed to Albertus Magnus, we find a chapter entitled "Signa mulieris calidae naturae et quae coit libenter," which may be summarized here. "The signs," we are told, "of a woman of warm temperament, and one who willingly cohabits are these: youth, an age of over 12, or younger, if she has been seduced, small, high breasts, full and hard, hair in the usual positions; she is bold of speech, with a delicate and high voice, haughty and even cruel of disposition, of good complexion, lean rather than stout, inclined to like drinking. Such a woman always desires coitus, and receives satisfaction in the act. The menstrual flow is not abundant nor always regular. If she becomes pregnant the milk is not abundant. Her perspiration is less odorous than that of the woman of opposite temperament; she is fond of singing, and of moving about, and delights in adornments if she has any."

Polemon, in his *_Sulla Physionomia_*, has given among the signs of libidinous impulse: knees turned inwards, abundance of hairs on the legs, squint, bright eyes, a high and strident voice, and in women length of leg below the knee. Aristotle had mentioned among the signs of wantonness: paleness, abundance of hair on the body, thick and black hair, hairs covering the temples, and thick eyelids.

In the seventeenth century Bouchet, in his *_Serees_* (Troisieme Seree), gave as the signs of virility which indicated that a man could have children: a great voice, a thick rough black beard, a large thick nose.

G. Tourdes (Art. "Aphrodisie," *_Dictionnaire Encyclopedique des Sciences Medicales_*) thus summarized the ancient beliefs on this subject: "The erotic temperament has been described as marked by a lean figure, white and well-ranged teeth, a developed hairy

system, a characteristic voice, air, and expression, and even a special odor."

In approaching the question of the general physical indications of a special aptitude to the manifestation of vigorous detumescence, the most obvious preliminary would seem to be a study of the castrated. If we know the special peculiarities of those who by removal of the sexual glands at a very early age have been deprived of all ability to present the manifestations of detumescence, we shall probably be in possession of a type which is the reverse of that which we may expect in persons of a vigorously erotic temperament.

The most general characteristics of eunuchs would appear to be an unusual tendency to put on fat, a notably greater length of the legs, absence of hair in the sexual and secondary sexual regions, a less degree of pigmentation, as noted both in the castrated negro and the white man, a puerile larynx and puerile voice. In character they are usually described as gentle, conciliatory, and charitable.

There can be little doubt that castration in man tends to lead to lengthening of the legs (tibia and fibula) at puberty, from delayed ossification of the epiphyses. The hands and feet are also frequently longer and sometimes the forearms. At the same time the bones are more slender. The pelvis also is narrower. The eunuchs of Cairo are said to be easily seen in a crowd from their tall stature. (Collineau, quoting Lortet, *_Revue Mensuelle de l'Ecole d'Anthropologie_*, May, 1896.) The castrated Skoptzy show increased stature, and, it seems, large ears, with decreased chest and head (L. Pittard, *_Revue Scientifique_*, June 20, 1903.) Fere shows that in most of these respects the eunuch resembles beardless and infantile subjects. ("Les Proportions des Membres et les Caracteres Sexuels," *_Journal de l'Anatomie et de la Physiologie_*, November-December, 1897.) Similar phenomena are found in animals generally. Sellheim, carefully investigating castrated horses, swine, oxen and fowls, found retardation of ossification, long and slender extremities, long, broad, but low skull, relatively smaller pelvis and small thorax. ("Zur Lehre von den Sekundaeren Geschlechtscharakteren," *_Beitraege zur Geburtshuelfe und Gynaekologie_*, 1898, summarized in *_Centralblatt fuer Anthropologie_*, 1900, Heft IV.)

As regards the mental qualities and moral character of the

castrated, Griffiths considers that there is an undue prejudice against eunuchs, and refers to Narses, who was not only one of the first generals of the Roman Empire, but a man of highly estimable character. (Lancet, March 30, 1895.) Matignon, who has carefully studied Chinese eunuchs, points out that they occupy positions of much responsibility, and, though regarded in many respects as social outcasts, possess very excellent and amiable moral qualities (Archives Cliniques de Bordeaux, May, 1896.) In America Everett Flood finds that epileptics and feeble-minded boys are mentally and morally benefited by castration. ("Notes on the Castration of Idiot Children," American Journal of Psychology, January, 1899.) It is often forgotten that the physical and psychic qualities associated with and largely dependent on the ability to experience the impulse of detumescence, while essential to the perfect man, involve many egoistic, aggressive and acquisitive characteristics which are of little intellectual value, and at the same time inimical to many moral virtues.

We have a further standard--positive this time rather than negative--to aid us in determining the erotic temperament: the phenomena of puberty. The efflorescence of puberty is essentially the manifestation of the ability to experience detumescence. It is therefore reasonable to suppose that the individuals in whom the special phenomena of puberty develop most markedly are those in whom detumescence is likely to be most vigorous. If such is the case we should expect to find the erotic temperament marked by developed larynx and deep voice, a considerable degree of pigmentary development in hair and skin, and a marked tendency to hairiness; while in women there should be a pronounced growth of the breasts and pelvis.[144]

There is yet another standard by which we may measure the individual's aptitude for detumescence: the presence of those activities which are most prominently brought into play during the process of detumescence. The individual, that is to say, who is organically most apt to manifest the physiological activities which mainly make up the process of detumescence, is most likely to be of pronounced erotic temperament.

"Erotic persons are of motor type," remark Vaschide and Vurpas, "and we may say generally that nearly all persons of motor type are erotic." The state of detumescence is one of motor and muscular energy and of great vascular activity, so that habitual energy of motor response and an active

circulation may reasonably be taken to indicate an aptitude for the manifestation of detumescence.

These three types may be said, therefore, to furnish us valuable though somewhat general indications. The individual who is farthest removed from the castrated type, who presents in fullest degree the characters which begin to emerge at the period of puberty, and who reveals a physiological aptitude for the vigorous manifestation of those activities which are called into action during detumescence, is most likely to be of erotic temperament. The most cautious description of the characteristics of this temperament given by modern scientific writers, unlike the more detailed and hazardous descriptions of the early physiognomists, will be found to be fairly true to the standards thus presented to us.

The man of sexual type, according to Bierent (*_La Puberte_*, p. 148), is hairy, dark and deep-voiced.

"The men most liable to satyriasis," Bouchereau states (art. "Satyriasis," *_Dictionnaire Encyclopedique des Sciences Medicales_*), "are those with vigorous nervous system, developed muscles, abundant hair on body, dark complexion, and white teeth."

Mantegazza, in his *_Fisiologia del Piacere_*, thus describes the sexual temperament: "Individuals of nervous temperament, those with fine and brown skins, rounded forms, large lips and very prominent larynx enjoy in general much more than those with opposite characteristics. A universal tradition," he adds, "describes as lascivious humpbacks, dwarfs, and in general persons of short stature and with long noses."

In a case of nymphomania in a young woman, described by Alibert (and quoted by Laycock, *_Nervous Diseases of Women_*, p. 28) the hips, thighs and legs were remarkably plump, while the chest and arms were completely emaciated. In a somewhat similar case described by Marc in his *_De la Folie_* a peasant woman, who from an early age had experienced sexual hyperaesthesia, so that she felt spasmodic voluptuous feelings at the sight of a man, and was thus the victim of solitary excesses and of spasmodic movements which she could not repress, the upper part of the body was very thin, the hips, legs and thighs highly developed.

In his work on Uterine and Ovarian Inflammation (1862, p. 37) Tilt observes: "The restless, bashful eye, and changing complexion, in presence of a person of the opposite sex, and a nervous restlessness of body, ever on the move, turning and twisting on sofa or chair, are the best indications of sexual temperament."

An extremely sensual little girl of 8, who was constantly masturbating when not watched, although brought up by nuns, was described by Busdraghi (Archivio di Psichiatria, fas. i, 1888, p. 53) as having chestnut hair, bright black eyes, an elevated nose, small mouth, pleasant round face, full colored cheeks, and plump and healthy aspect.

A highly intelligent young Italian woman with strong and somewhat perverted sexual impulses is described as of attractive appearance, with olive complexion, small black almond-shaped eyes, dilated pupils, oblique thin eyebrows, very thick black hair, rather prominent cheek-bones, largely developed jaw, and with abundant down on lower part of cheeks and on upper lip. (Archivio di Psichiatria, 1899, fasc. v-vi.)

As the type of the sensual woman in word and act, led by her passions to commit various sexual offenses, Ottolenghi describes (Archivio di Psichiatria, vol. xii, fasc. v-vi, p. 496) a woman of 32 who attempted to kill her lover. The daughter of parents who were neurotic and themselves very erotic, she was a highly intelligent and vivacious woman, with a pleasing and open face, very thick dark chestnut hair, large cheek-bones, adipose buttocks almost resembling those of a Hottentot, and very thick pubic hair. She was very fond of salt things. Sexual inclination began at the age of 7.

Adler and Moll remark, very truly, that, so far at least as women are concerned, sexual anaesthesia or sexual proclivity cannot be unfailingly read on the features. Every woman desires to please, and coquetry is the sign of a cold, rather than of an erotic temperament.[145] It may be added that a considerable degree of congenital sexual anaesthesia by no means prevents a woman from being beautiful and attractive, though it must probably still always be said that, as Roubaud points out,[146] the woman of cold and intellectual temperament, the "femme de tete," however beautiful and skillful she may be, cannot compete in the struggle for love

with the woman whose qualities are of the heart and of the emotions. But it seems sufficiently clear that the practical observations of skilled and experienced observers agree in attributing to persons of erotic type certain general characteristics which accord with those negative and positive standards we may frame on the basis of castration, of puberty, and of detumescence. It may be worth while to note a few of these characteristics briefly.

The abnormal lengthening of the long bones at the age of puberty in the castrated is, as we have seen, very pronounced. There is little tendency to associate length of limb with an erotic temperament, and a certain amount of data as well as of more vague opinion points in the opposite direction. The Arabs would appear to believe that it is short rather than tall people in whom the sexual instinct is strongly developed, and we read in the *_Perfumed Garden_*: "Under all circumstances little women love coitus more and evince a stronger affection for the virile member than women of a large size." In his elaborate investigation of criminals Marro found that prostitutes and women guilty of sexual offenses, as also male sexual offenders, tend to be short and thick set.[147] In European folk-lore the thick, bull neck is regarded as a sign of strong sexuality.[148] Mantegazza refers to a strong sexual temperament as being associated with arrest or disorder of bony development, and Marro suggests that the proverbial salacity of rachitic individuals may be due to an increased activity of the sexual organs.[149] It may be added that acromegaly, with its excessive bony growths, tends to be associated with premature sexual involution.

A further point which is frequently mentioned in the case of women is the development of the chief secondary sexual regions: the pelvis and the breasts. It is, indeed, almost inevitable that there should be some degree of correlation between the aptitude for bearing children and the aptitude for experiencing detumescence. The reality of such a connection is not only evidenced by medical observations, but receives further testimony in popular beliefs. In Italy women with large buttocks are considered wanton, and among the South Slavs they are regarded as especially fruitful.[150] Blumenbach asserted that precocious venery will enlarge the breasts, and believed that he had found evidence of this among young London prostitutes.[151]

The association of the aptitude for detumescence with a tendency to a deep rather than to a high voice, both in men and women, has frequently been noted and has seldom been denied. The onset of puberty always affects the

voice; in general, Bierent states, the more bass the voice is the more marked is the development of the sexual apparatus; "a very robust man, with very developed sexual organs, and very dark and abundant hairy system, a man of strong puberty in a word, is nearly always a bass." [152] The influence of sexual excitement in deepening the voice is shown by the rules of sexual hygiene prescribed to tenors, while a bass has less need to observe similar precautions. In women every phase of sexual life--puberty, menstruation, coitus, pregnancy--tends to affect the voice and always by giving it a deeper character. The deepening of the voice by sexual intercourse was an ancient Greek observation, and Martial refers to a woman's good or bad singing as an index to her recent sexual habits. Prostitutes tend to have a deep voice. Venturi points out that married women preserve a fresh voice to a more advanced age than spinsters, this being due to the precocious senility in the latter of an unused function. Such a phenomenon indicates that the relationship of detumescence to the deepening of the voice is not quite simple. This is further indicated by the fact that in robust men abstinence still further deepens the voice (the monk of melodrama always has a bass voice), while excessive or precocious sexual indulgence tends to be associated with the same kind of puerile voice as is found in those persons in whom pubertal development has not been carried very far, or who are of what Griffiths terms eunuchoid type. Idiot boys, who are often sexually undeveloped, tend to have a high voice, while idiot girls (who often manifest marked sexual proclivities) not infrequently have a deep voice. [153]

Bright dilated eyes are among the phenomena of detumescence, and are very frequently noted in persons of a pronounced erotic temperament. This is, indeed, an ancient observation, and Burton says of people with a black, lively, and sparkling eye, "without question they are most amorous," drawing his illustrations mostly from classic literature. [154] Tardieu described the erotic woman as having bright eyes, and Heywood Smith states that the eyes of lascivious women resemble, though in a less degree, those of the insane. [155] Sexual excitement is one among many causes--intellectual excitement, pain, a loud noise, even any sensory irritation--which produce dilatation of the pupils and enlargement of the palpebral fissure, with some protrusion of the eyeball. The influence of the sexual system upon the eye appears to be far less potent in men than in women. [156] Sexual desire is, however, by no means the only irritant within the sexual sphere which may thus influence the eye; morbid irritations may produce the same effect. Milner Fothergill, in his book on Indigestion, vividly describes the appearance of the eyes sometimes seen in ovarian disorder: "The glittering flash which glances out from

some female irides is the external indication of ovarian irritation, and 'the ovarian gleam' has features quite its own. The most marked instance which ever came under my notice was due to irritation in the ovaries, which had been forced down in front of the uterus and been fixed there by adhesions. Here there was little sexual proclivity, but the eyes were very remarkable. They flashed and glittered unceasingly, and at times perfect lightning bolts shot from them. Usually there is a bright glittering sheen in them which contrasts with the dead look in the irides of sexual excess or profuse uterine discharges."

The activity of the glandular secretions, and especially those of the skin, during detumescence, would lead us to expect that such secretory activity is an index to an aptitude for detumescence. As a matter of fact it is occasionally, though not frequently, noted by medical observers. It is stated that the erotic temperament is characterized by a special odor.[157] The activity of the sweat-glands is seldom referred to by medical observers in describing persons of erotic temperament, although the descriptions of novelists not infrequently contain allusions to this point, and the literature of an earlier age shows that the tendency to perspiration, especially the moist hand, was regarded as a sure sign of a sensual temperament. "The moist-handed Madonna Imperia, a most rare and divine creature," remarks Lazarillo in Middleton's comedy *Blurt, Master-Constable*, to quote one of many allusions to this point in the Elizabethan drama.

The lips are sometimes noted as red and everted, perhaps thick[158]; Tardieu remarked that the typically erotic woman has thick red lips. This corresponds with the characteristic type of the satyr in classic statues as in later paintings; his lips are always thick and everted. Fullness, redness, and eversion of the lips are correlated with good breathing, the absence of anaemia, laughter, a well-fleshed face.

This kind of mouth indicates, perhaps, not so much a congenitally erotic temperament, as an abandonment to impulse. The opposite type of mouth--with inverted, thin, and retracted lips--would appear to be found with especial frequency in persons who habitually repress their impulses on moral grounds. Any kind of effort to restrain involuntary muscular action may lead to retraction of the lips: the effort to overcome anger or fear, or even the resistance to a strong desire to urinate or defecate. In religious young men, however, it becomes habitual and fixed. I recall a small band of medical students, gathered together from a

large medical school, who were accustomed to meet together for prayer and Bible-reading; the majority showed this type of mouth to a very marked degree: pale faces, with drawn, retracted lips. It may be termed the Christian or pious facies. It is much less frequently seen in religious women (unless of masculine type), doubtless because religion for women is in a much less degree than for men a moral discipline.

It may be added that an interesting form of this contraction of the lips, and one that is not purely repressive, is that which indicates the state of muscular tension associated with the impulse to guard and protect. In this form the contracted mouth is the index of tenderness, and is characteristic of the mother who is watching over the infant she is suckling at her breast. I have observed precisely the same expression in the face of a boy of 14 with a large congenital scrotal hernia; when the tumor was being examined his lower lip became retracted, well marked lines appearing from the angles downwards, though the upper lip retained its normal expression. It was precisely the tender look we may see in the faces of mothers who are watching anxiously over their offspring, and the emotion is evidently the same in both cases: solicitude for a sensitive and tenderly guarded object.

The degree of pigmentation is clearly correlated with sexual vigor. "In general," Heusinger laid down, in 1823, "the quantity of pigment is proportional to the functional effectiveness of the genital organs." This connection is so profound that it may be traced very widely throughout the organic world.

The connection between pigmentation and sexual activity is very ancient. Even leaving out of account the wedding apparel of animals, nearly always gorgeous in scales and plumage and hair, the sexual orifice shows a more or less marked tendency to pigmentation during the breeding season from fishes upward, while in mammals the darker pigmentation of this region is a constant phenomenon in sexually mature individuals.[159]

In the human species both the negative standard of castration and the positive standard of puberty alike indicate a correlation of this kind. Those individuals in whom puberty never fully develops and who are consequently said to be affected by infantilism, reveal a relative absence of pigment in the sexual centers which are normally pigmented to a high

degree.[160] Among those Asiatic races who extirpate the ovaries in young girls the skin remains white in the perineum, round the anus, and in the armpits.[161] Even in mature women who undergo ovariectomy, as Kepler found, the pigmentation of the nipples and areola disappears, as well as of the perineum and anus, the skin taking on a remarkable whiteness.

Normally the sexual centers, and in a high degree the genital orifice, represent the maximum of pigmentation, and under some circumstances this is clearly visible even in infancy. Thus babies of mixed black and white blood may show no traces of negro ancestry at birth, but there will always be increased pigmentation about the external genitalia.[162] The *linea fusca*, which reaches from the pubes to the navel and occasionally to the ensiform cartilage, is a line of sexual pigmentation sometimes regarded as characteristic of pregnancy, but as Andersen, of Copenhagen, has found by the examination of several hundred children of both sexes, it exists in a slight form in about 75 per cent. of young girls, and in almost as large a proportion of boys. But there is no doubt that it tends to increase with age as well as to become marked at pregnancy. At puberty there is a general tendency to changes in pigmentation; thus Godin found that in 28 per cent, adolescent changes occurred in the eyes and hair at this period, the hair becoming darker, though the eyes sometimes become lighter. Ammon, in his investigation of conscripts at the age of 20 (*post*, p. 196), discovered the significant fact that the eyes and hair darken *pari passu* with sexual development. In women, during menstruation, there is a general tendency to pigmentation; this is especially obvious around the eyes, and in some cases black rings of true pigment form in this position. Even the skin of the negro women of Loango sometimes becomes a few shades darker during menstruation.[163] During pregnancy this tendency to pigmentation reaches its climax. Pregnancy constantly gives rise to pigmentation of the face, the neck, the nipples, the abdomen, and this is especially marked in brunettes.

This association of pigmentation and sexual aptitudes has been recognized in the popular lore of some peoples. Thus the Sicilians, who admire brown skin and have no liking either for a fair skin or light hair, believe that a white woman is incapable of responding to love. It is the brown woman who feels love; as it is said in Sicilian dialect: "*Fimmina scura, fimmina amurusa.*"[164]

The dependence of pigmentation upon the sexual system is shown by the fact that irritation of the genital organs by disease will frequently suffice to produce a high degree of pigmentation. This

may the neck, the trunk, the hands. Simpson long since noted that uterine irritation apart from pregnancy may produce pigmentation of the areolae of the nipples (*_Obstetric Works_*, vol. i, p. 345). Engelmann discussed the subject and gave cases, "The Hystero-Neuroses," pp. 124-139, in *_Gynaecological Transactions_*, vol. xii, 1887; and a summary of a memoir by Fouquet on this subject in *_La Gynecologie_*, February, 1903, will be found in *_British Medical Journal_*, March 28, 1903,

Of all physical traits vigor of the hairy system has most frequently perhaps been regarded as the index of vigorous sexuality. In this matter modern medical observations are at one with popular belief and ancient physiognomical assertions.[165] The negative test of castration and the positive test of puberty point in the same direction.

It is at puberty that all the hair on the body, except that on the head, begins to develop; indeed, the very word "puberty" has reference to this growth as the most obvious sign of the whole process. When castration takes place at an early age all this development of pubescent hair is arrested. When the primary sexual organs are undeveloped the sexual hair is also undeveloped, as in a case, recorded by Plant,[166] of a girl with rudimentary uterus and ovaries who had little or no axillary and pubic hair, although the hair of the head was long and strong.[167]

The pseudo-Michael Scot among the *_Signa mulieris calidae naturae et quae coit libenter_* stated that her hair, both on the head and body, is thick and coarse and crisp, and Della Porta, the greatest of the physiognomists, said that thickness of hair in women meant wantonness. Venette, in his *_Generation de l'Homme_*, remarked that men who have much hair on the body are most amorous. At a more recent period Roubaud has said that pubic hair in its quantity, color and curliness is an index of genital energy. A poor pilous system, on the other hand, Roubaud regarded as a probable though not an irrefragable proof of sexual frigidity in women. "In the cold woman the pilous system is remarkable for the languor of its vitality; the hairs are fair, delicate, scarce and smooth, while in ardent natures there are little curly tufts about the temples." (*_Traite de l'Impuissance_*, pp. 124, 523.) Martineau declared (*_Lecons sur les Deformations Vulvaires_*, p. 40) that "the more developed the genital organs the more abundant the hair covering them; abundance of hair appears to be in relation to the perfect

development of the organs." Tardieu described the typically erotic woman as very hairy.

Bergh found that among 2200 young Danish prostitutes those who showed an unusual extension and amount of pubic hair included several women who were believed to be libidinous in a very high degree. (Bergh, "Symbolae," etc., *Hospitalstidende*, August, 1894.) Moraglia, again, in Italy, in describing various women, mostly prostitutes, of unusually strong sexual proclivities, repeatedly notes very thick hair, with down on the face. (*Archivio di Psichiatria*, vol. xvi, fasc. iv-v.)

Marro, also, in Italy found that abundance of hair and down is especially marked in women who are guilty of infanticide (as also Pasini has found), though criminal women generally, in his experience, tend to have abnormally abundant hair. (*Caratteri del Delinquenti*, cap. XXII.) Lombroso finds that prostitutes generally tend to be hairy (*Donna Delinquente*, p. 320.)

A lad of 14, guilty of numerous crimes of violence having a sexual source, is described by Arthur Macdonald in America as having hair on the chest as well as all over the pubes. (A. Macdonald, *Archives de L'Anthropologie Criminelle*, January, 1893, p. 55.) The association of hairiness with abnormal sexuality in the weak-minded has been noted at Bicetre (*Recherches Cliniques sur l'Epilepsie*, vol. xix, pp. 69, 77.)

Hypertrichosis universalis, a general hairiness of body, has been described by Cascella in a woman with very strong sexual desires, who eventually became insane. (*Revista Mensile di Psichiatria*, 1903, p. 408.) Bucknill and Tuke give the case of a religiously minded girl, with very strong and repressed sexual desires, who became insane; the only abnormal feature in her physical development was the marked growth of hair over the body.

Brantome refers to a great lady known to him whose body was very hairy, and quotes a saying to the effect that hairy people are either rich or wanton; the lady in question, he adds, was both. (Brantome, *Vie des Dames Galantes*, Discours II.)

De Sade, whose writings are now regarded as a treasure house of true observations in the domain of sexual psychology, makes the

Rodin of _Justine_ dark, with much hair and thick eyebrows, while his very sexual sister is described as dark, thin and very hairy. (Duehren, _Der Marquis de Sade_, third edition, p. 440.)

A correspondent who has always taken a special interest in the condition as regards hairiness of the women to whom he has been attracted, has sent me notes concerning a series of 12 women. It may be gathered from these notes that 5 women were neither markedly sexual nor markedly hairy (either as regards head or pubes), 6 cases both hairy and sexual, 1 was sexual and not hairy, none were hairy and not sexual. My correspondent remarks: "There may be women with scanty pubic hair possessing very strong sexual emotions. My own experience is quite the opposite." He has also independently reached the conclusion, arrived at by many medical observers and clearly suggested by some of the facts here brought together, that profuse hair frequently denotes a neurotic temperament.

It may be added that Mirabeau, as we learn from an anecdote told by an eyewitness and recorded by Legouve, had a very hairy chest, while the same is recorded of Restif de la Bretonne.

It is a very ancient and popular belief that if a hairy man is not sensual he is strong: _vir pilosus aut libidinosus aut fortis_. The Greeks insisted on the hairy nates of Hercules, and Ninon de l'Enclos, when the great Conde shared her bed without touching her, remarked, on seeing his hairy body: "Ah, Monseigneur, que vous devez etre fort!" It may be doubted whether there is any exact parallelism between muscular strength and hairiness, for strength is largely a matter of training, but there can be no doubt that hairiness really tends to be associated with a generally vigorous development of the body.

Although the observations concerning hairiness of body as an index of vigor, whether sexual or only generally physical, are so ancient, until recent years no attempts have been made to demonstrate on a large scale whether there is actually a correlation between hairiness and sexual or general development of the body. Some importance, therefore, attaches to Ammon's careful observations of many thousand conscripts in Baden. These observations fully justify this ancient belief, since they show that on the one hand the size of the testicles, and on the other hand girth of chest and stature, are correlated with hairiness of body.

Ammon's observations were made on nearly 4000 conscripts of the age of 20. From the point of view of the hairy system he divided them, into four classes:--

I. To which 6.1 per cent, of the men belonged, with smooth bodies.

II. Including 25.3 per cent., only slight hairiness.

III. 53.8 per cent., more developed hairy system, but belly, breast and back smooth.

IV. 14.7 per cent., hair all over body.

V. 0.1 per cent., extreme cases of hairiness.

The beardless were 12.1 per cent., those with no axillary hair 9 per cent., those with no hair on pubis 0.4 per cent. This corresponds with the fact that hair appears first on the pubis and last on the chin.

In the first class 69 per cent, were beardless, 54 per cent, without any axillary hair and 6 per cent, without pubic hair. In the second class 24 per cent, were beardless, 17 per cent, without axillary hair. In the third class 3 per cent, were beardless and 3 per cent without axillary hair.

Below puberty the diameter of testicles is below 14 millimeters. There were 13 conscripts having a testicular diameter of less than 14 millimeters. These infantile individuals all belonged to the first three classes and mostly to the first. The average testicular diameter in the first class was nearly 24 millimeters, and progressively rose in the succeeding classes to over 26 millimeters in the fourth.

While there was not much difference in height, the first class was the shortest, the fourth the tallest. The fourth class also showed the greatest chest perimeter. The cephalic index of all classes was 84. (O. Ammon, "L'Infantilisme et le Feminisme au Conseil de Revision," L'Anthropologie, May-June, 1896.)

We thus see that it is quite justifiable to admit a type of person who

possesses a more than average aptitude for detumescence. Such persons are more likely to be short than tall; they will show a full development of the secondary sexual characters; the voice will tend to be deep and the eyes bright; the glandular activity of the skin will probably be marked, the lips everted; there is a tendency to a more than average degree of pigmentation, and there is frequently an abnormal prevalence of hair on some parts of the body. While none of these signs, taken separately, can be said to have any necessary connection with the sexual impulse, taken altogether they indicate an organism that responds to the instinct of detumescence with special aptitude or with marked energy. In these respects observation, both scientific and popular, concords with the probabilities suggested by the three standards in this matter which have already been set forth.

No generalization, however, can here be set down in an absolute and unqualified manner. There are definite reasons why this should be so. There is, for instance, the highly important consideration that the sexual impulse of the individual may be conspicuous in two quite distinct ways. It may assume prominence because the individual possesses a highly vigorous and well-nourished organism, or its prominence may be due to mental irritation in a very morbid individual. In the latter case--although occasionally the two sets of conditions are combined--most of the signs we might expect in the former case may be absent. Indeed, the sexual impulses which proceed from a morbid psychic irritability do not in most cases indicate any special aptitude for detumescence at all; in that largely lies their morbid character.

Again, just in the same way that the exaggerated impulse itself may either be healthy or morbid, so the various characters which we have found to possess some value as signs of the impulse may themselves either be healthy or morbid. This is notably the case as regards an abnormal growth of hair on the body, more especially when it appears on regions where normally there is little or no hair. Such hypertrichosis is frequently degenerative in character, though still often associated with the sexual system. When, however, it is thus a degenerative character of sexual nature, having its origin in some abnormal foetal condition or later atrophy of the ovaries, it is no necessary indication of any aptitude for detumescence.

Idiots, more especially it would seem idiot girls, tend to show a highly developed hairy system. Thus Voisin, when investigating 150 idiot and imbecile girls, found the hair long and thick and

tending to occupy a large surface; one girl had hair on the areolae of the mamma. (J. Voisin, "Conformation des organes genitaux chez les Idiots," Annales d'Hygiene Publique, June, 1894.) It should be said that in idiot boys puberty is late, and the sexual organs as well as the sexual instinct frequently undeveloped, while in idiot girls there is no delay in puberty, and the sexual organs and instinct are frequently fully and even abnormally developed.

Hegar has described an interesting case showing an association, of foetal origin, between sexual anomaly and abnormal hairness. In this case a girl of 16 had a uterus duplex, an infantile pelvis, very slight menstruation and undeveloped breasts. She was very hairy on the face, the anterior aspects of the chest and abdomen, the sexual regions, and the thighs, but not specially so on the rest of the body. The hairs were of lanugo-like character, but dark in color. (A. Hegar, Beitraege zur Geburtshuelfe und Gynaekologie, vol. i, p. III, 1898.) Sometimes hirsuties of the face and abdomen begin to appear during pregnancy, apparently from disease or degeneration of the ovaries. (A case is noted in British Medical Journal, August 2 and 16, pp. 375 and 436, 1902.) Laycock many years ago referred to the popular belief that women who have hair on the upper lip seldom bear children, and regarded this opinion as "questionless founded on fact." (Laycock, Nervous Diseases of Women, p. 22.) When this is so, we may suppose that the abnormal hairy growth is associated with degeneration of the ovaries.

There is another factor which enters into this question and renders the definition of a physical sexual type less precise than it would otherwise be. The sexual instinct is common to all persons, and while it seems probable that there is a type of person in whom sexual energies are predominant, it would also appear that the people who otherwise show a very high level of energy in life usually exhibit a more than average degree of energy in matters of love. The predominantly sexual type, as we have seen, tends to be associated with a high degree of pigmentation; the person specially apt for detumescence inclines to belong to the dark rather than to the purely fair group of the population. On the other hand, the active, energetic, practical man, the man who is most apt for the achievement of success in life, tends to belong to the fair rather than to the dark type.[168] Thus we have a certain conflict of tendencies, and it becomes possible to assert that while persons with pronounced aptitude for

sexual detumescence tend to be dark, persons whose pronounced energy in sexual matters tends to ensure success are most likely to be fair.

The tendency of the fair energetic type, the type of the northern European man, to sexuality may be connected with the fact that the violent and criminal man who commits sexual crimes tends to be fair even amid a dark population. Criminals on the whole would appear to tend to be dark rather than fair; but Marro found in Italy that the group of sexual offenders differed from all other groups of criminals in that their hair was predominantly fair. (*Caratteri del Delinquenti*, p. 374.) Ottolenghi, in the same way, in examining 100 sexual offenders, found that they showed 17 per cent., of fair hair, though criminals generally (on a basis of nearly 2000) showed only 6 per cent., and normal persons (nearly 1000) 9 per cent. Similarly while the normal persons showed only 20 per cent. of blue eyes and criminals generally 36 per cent., the sexual offenders showed 50 per cent. of blue eyes. (Ottolenghi, *Archivio di Psichiatria*, fasc. vi, 1888, p. 573.) Burton remarked (*Anatomy of Melancholy*, Part III, Section II, Mem. II, Subs. II) that in all ages most amorous young men have been yellow-haired, adding, "Synesius holds every effeminate fellow or adulterer is fair-haired." In folk-lore, it has been noted (*Kryptadia*, vol. ii, p. 258), red or yellow hair is sometimes regarded as a mark of sexuality.

In harmony with this fairness, sexual offenders would appear to be more dolichocephalic than other criminals. In Italy Marro found the foreheads of sexual offenders to be narrow, and in California Draehms found that while murderers had an average cephalic index of 83.5, and thieves of 80.5, that of sexual offenders was 79.

On the other hand, high cheek-bones and broad faces--a condition most usually found associated with brachycephaly--have sometimes been noted as associated with undue or violent sexuality. Marro noted the excess of prominent cheek-bones in sexual offenders, and in America it has been found that unchaste girls tend to have broad faces. (*Pedagogical Seminary*, December, 1896, pp. 231, 235.)

It will be seen that, when we take a comprehensive view of the facts and considerations involved, it is possible to obtain a more definite and

coherent picture of the physical signs of a marked aptitude for detumescence than has hitherto been usually supposed possible. But we also see that while the _ensemble_ of these signs is probably fairly reliable as an index of marked sexuality, the separate signs have no such definite significance, and under some circumstances their significance may even be reversed.

[164] C. Pitre, *_Medicina Populare Siciliana_*, p. 47. In England, from notes sent to me by one correspondent, it would appear that the proportion of dark and sexually apt women to fair and sexually apt women is as 3 to 1. The experience of others would doubtless give varying results, and in any case the fallacies are numerous. See, in the previous volume of these *_Studies_*, "Sexual Selection in Man," Section IV.

[165] In Japan the same belief would appear to be held. In a nude figure representing the typical voluptuous woman by the Japanese painter Marugama Okio (reproduced in Ploss's *_Das Weib_*) the pubic and axillary hair is profuse, though usually sparse in Japan.

[166] *_Centralblatt fuer Gynaekologie_*, No. 9, 1896.

[167] It is important to remember that there is little correlation in this matter between the hair of the head and the sexual hair, if not a certain opposition. (See *_ante_*, p. 127.) According to one of the aphorisms of Hippocrates, repeated by Buffon, eunuchs do not become bald, and Aristotle seems to have believed that sexual intercourse is a cause of baldness in men. (Laycock, *_Nervous Diseases of Women_*, p. 23.)

[168] For some of the evidence on this point, see Havelock Ellis, "The Comparative Abilities of the Fair and the Dark," Monthly Review, August, 1901; cf. id., A Study of British Genius, Chapter X.

THE PSYCHIC STATE IN PREGNANCY.

The Relationship of Maternal and Sexual Emotion--Conception and Loss of Virginity--The Anciently Accepted Signs of This Condition--The Pervading Effects of Pregnancy on the Organism--Pigmentation--The Blood and Circulation--The Thyroid--Changes in the Nervous System--The Vomiting of Pregnancy--The Longings of Pregnant Women--Maternal Impressions--Evidence for and Against Their Validity--The Question Still Open--Imperfection of Our Knowledge--The Significance of Pregnancy.

In analyzing the sexual impulse I have so far deliberately kept out of view the maternal instinct. This is necessary, for the maternal instinct is specific and distinct; it is directed to an aim which, however intimately associated it may be with that of the sexual impulse proper, can by no means be confounded with it. Yet the emotion of love, as it has finally developed in the world, is not purely of sexual origin; it is partly sexual, but it is also partly parental.[169]

In so far as it is parental it is certainly mainly maternal. There is a drawing by Bronzino in the Louvre of a woman's head gazing tenderly down at some invisible object; is it her child or her lover? Doubtless her child, yet the expression is equally adequate to the emotion evoked by a lover. If we were here specifically dealing with the emotion of love as a complex whole, and not with the psychology of the sexual impulse, it would certainly be necessary to discuss the maternal instinct and its associated emotions. In any case it seems desirable to touch on the psychic state of pregnancy, for we are here concerned not only with emotions very closely connected with the sexual emotions in the narrower sense, but we here at last approach that state which it is the object of the whole sexual process to achieve.

In civilized life a period of weeks, months, even years, may elapse between the establishment of sexual relations and the occurrence of

conception. Under primitive conditions the loss of the virginal condition practically involves the pregnant condition, so that under primitive conditions very little allowance is made for the state, so common among civilized peoples, of the woman who is no longer a virgin, yet not about to become a mother.

There is some interest in noting the signs of loss of virginity chiefly relied upon by ancient authors. In doing this it is convenient to follow mainly the full summary of authorities given by Schurig in his *_Parthenologia_* early in the eighteenth century. The ancient custom, known in classic times, of measuring the neck the day after marriage was frequently practiced to ascertain if a girl was or was not a virgin. There were various ways of doing this. One was to measure with a thread the circumference of the bride's neck before she went to bed on the bridal night. If in the morning the same thread would not go around her neck it was a sure sign that she had lost her virginity during the night; if not, she was still a virgin or had been deflowered at an earlier period. Catullus alluded to this custom, which still exists, or existed until lately, in the south of France. It is perfectly sound, for it rests on the intimate response by congestion of the thyroid gland to sexual excitement. (*_Parthenologia_*, p. 283; Bierent, *_La Puberte_*, p. 150; Havelock Ellis, *_Man and Woman_*, fourth edition, p. 267.)

Some say, Schurig tells us, that the voice, which in the virgin is shrill, becomes rougher and deeper after the first coitus. He quotes Riolan's statement that it is certain that the voice of those who indulge in venery is changed. On that account the ancients bound down the penis of their singers, and Martial said that those who wish to preserve their voices should avoid coitus. Democritus who one day had greeted a girl as "maiden" on the following day addressed her as "woman," while in the same way it is said that Albertus Magnus, observing from his study a girl going for wine for her master, knew that she had had sexual intercourse by the way because on her return her voice had become deeper. Here, again, the ancient belief has a solid basis, for the voice and the larynx are really affected by sexual conditions. (*_Parthenologia_*, p. 286; Marro, *_La Puberte_*, p. 303; Havelock Ellis, *op. cit.*, pp. 271, 289.)

Others, again, Schurig proceeds, have judged that the goatly smell

given out in the armpits during the venereal act is also no uncertain sign of defloration, such odor being perceptible in those who use much venery, and not seldom in harlots and the newly married, while, as Hippocrates said, it is not perceived in boys and girls. (*_Parthenologia_*, p. 286; cf. the previous volume of these *_Studies_*, "Sexual Selection in Man," p. 64.)

In virgins, Schurig remarks, the pubic hair is said to be long and not twisted, while in women accustomed to coitus it is crisper. But it is only after long and repeated coitus, some authors add, that the pubic hairs become crisp. Some recent observers, it may be remarked, have noted a connection between sexual excitation and the condition of the pubic hair in women. (Cf. the present volume, *_ante_* p. 127.)

A sign to which the old authors often attached much importance was furnished by the urinary stream. In the *_De Secretis Mulierum_*, wrongly attributed to Albertus Magnus, it is laid down that "the virgin urinates higher than the woman." Riolan, in his *_Anthropographia_*, discussing the ability of virgins to ejaculate urine to a height, states that Scaliger had observed women who were virgins emit urine in a high jet against a wall, but that married women could seldom do this. Bouacius also stated that the urine of virgins is emitted in a small stream to a distance with an acute hissing sound. (*_Parthenologia_*, p. 281.) A folk-lore belief in the reality of this influence is evidenced by the Picardy *_conte_* referred to already (*_ante_*, p. 53), "La Princesse qui pisse au dessus les Meules." There is no doubt a tendency for the various stresses of sexual life to produce an influence in this direction, though they act far too slowly and uncertainly to be a reliable index to the presence or the absence of virginity.

Another common ancient test of virginity by urination rests on a psychic basis, and appears in a variety of forms which are really all reducible to the same principle. Thus we are told in *_De Secretis Mulierum_* that to ascertain if a girl is seduced she should be given to eat of powdered crocus flowers, and if she has been seduced she immediately urinates. We are here concerned with auto-suggestion, and it may well be believed that with nervous and credulous girls this test often revealed the truth.

A further test of virginity discussed by Schurig is the presence of modesty of countenance. If a woman blushes her virtue is safe. In this way girls who have themselves had experience of the marriage bed are said to detect the virgin. The virgin's eyes are cast down and almost motionless, while she who has known a man has eyes that are bright and quick. But this sign is equivocal, says Schurig, for girls are different, and can simulate the modesty they do not feel. Yet this indication also rests on a fundamentally sound psychological basis. (See "The Evolution of Modesty," in the first volume of these Studies.)

In his Syllepsilogia (Section V, cap. I-II), published in 1731, Schurig discusses further the anciently recognized signs of pregnancy. The real or imaginary signs of pregnancy sought by various primitive peoples of the past and present are brought together by Ploss and Bartels, Das Weib, bd. i, Chapter XXVII.

Both physically and psychically the occurrence of pregnancy is, however, a distinct event. It marks the beginning of a continuous physical process, which cannot fail to manifest psychic reactions. A great center of vital activity--practically a new center, for only the germinal form of it in menstruation had previously existed--has appeared and affects the whole organism. "From the moment that the embryo takes possession of the woman," Robert Barnes puts it, "every drop of blood, every fiber, every organ, is affected." [170]

A woman artist once observed to Dr. Stratz, that as the final aim of a woman is to become a mother and pregnancy is thus her blossoming time, a beautiful woman ought to be most beautiful when she is pregnant. That is so, Stratz replied, if her moment of greatest physical perfection corresponds with the early months of pregnancy, for with the beginning of pregnancy metabolism is increased, the color of the skin becomes more lively and delicate, the breasts firmer. [171] Pregnancy may, indeed, often become visible soon after conception by the brighter eye, the livelier glance, resulting from greater vascular activity, though later, with the increase of strain, the face may tend to become somewhat thin and distorted. The hair, Barnes states, assumes a new vigor, even though it may have been falling out before. The temperature rises; the weight increases, even apart from the growth of the foetus. The efflorescence of pregnancy shows itself, as in the blossoming and fecundated flower, by increased pigmentation. [172] The nipples with their areolae, and the mid-line of the belly, become darker; brown flecks (lentigo) tend to

appear on the forehead, neck, arms, and body; while striae--at first blue-red, then a brilliant white--appear on the belly and thighs, though these are scarcely normal, for they are not seen in women with very elastic skins and are rare among peasants and savages.[173] The whole carriage of the woman tends to become changed with the development of the mighty seed of man planted within her; it simulates the carriage of pride with the arched back and protruded abdomen.[174] The pregnant woman has been lifted above the level of ordinary humanity to become the casket of an inestimable jewel.

It is in the blood and the circulation that the earliest of the most prominent symptoms of pregnancy are to be found. The ever increasing development of this new focus of vascular activity involves an increased vascular activity in the whole organism. This activity is present almost from the first--a few days after the impregnation of the ovum--in the breasts, and quickly becomes obvious to inspection and palpation. Before a quite passive organ, the breast now rapidly increases in activity of circulation and in size, while certain characteristic changes begin to take place around the nipples.[175] As a result of the additional work imposed upon it the heart tends to become slightly hypertrophied in order to meet the additional strain; there may be some dilatation also.[176]

The recent investigations of Stengel and Stanton tend to show that the increase of the heart's work during pregnancy is less considerable than has generally been supposed, and that beyond some enlargement and dilatation of the right ventricle there is not usually any hypertrophy of the heart.

The total quantity of blood is raised. While increased in quantity, the blood appears on the whole to be somewhat depreciated in quality, though on this point there are considerable differences of opinion. Thus, as regards haemoglobin, some investigators have found that the old idea as to the poverty of haemoglobin in pregnancy is quite unfounded; a few have even found that the haemoglobin is increased. Most authorities have found the red cells diminished, though some only slightly, while the white cells, and also the fibrin, are increased. But toward the end of pregnancy there is a tendency, perhaps due to the establishment of compensation, for the blood to revert to the normal condition.[177]

It would appear probable, however, that the vascular phenomena of pregnancy are not altogether so simple as the above statement would imply. The activity of various glands at this time--well illustrated by the

marked salivation which sometimes occurs--indicates that other modifying forces are at work, and it has been suggested that the changes in the maternal circulation during pregnancy may best be explained by the theory that there are two opposing kinds of secretion poured into the blood in unusual degree during pregnancy: one contracting the vessels, the other dilating them, one or the other sometimes gaining the upper hand. Suprarenal extract, when administered, has a vaso-constricting influence, and thyroid extract a vasodilating influence; it may be surmised that within the body these glands perform similar functions.[178]

The important part played by the thyroid gland is indicated by its marked activity at the very beginning of pregnancy. We may probably associate the general tendency to vasodilatation during early pregnancy with the tendency to goitre; Freund found an increase of the thyroid in 45 per cent. of 50 cases. The thyroid belongs to the same class of ductless glands as the ovary, and, as Bland Sutton and others have insisted, the analogies between the thyroid and the ovary are very numerous and significant. It may be added that in recent years Armand Gautier has noted the importance of the thyroid in elaborating nucleo-proteids containing arsenic and iodine, which are poured into the circulation during menstruation and pregnancy. The whole metabolism of the body is indeed affected, and during the latter part of pregnancy study of the ingesta and egesta has shown that a storage of nitrogen and even of water is taking place.[179] The woman, as Pinard puts it, forms the child out of her own flesh, not merely out of her food; the individual is being sacrificed to the species.

The changes in the nervous system of the pregnant woman correspond to those in the vascular system. There is the same increase of activity, a heightening of tension. Bruno Wolff, from experiments on bitches, concluded that the central nervous system in women is probably more easily excited in the pregnant than in the non-pregnant state, though he was not prepared to call this cerebral excitability "specific." [180] Direct observations on pregnant women have shown, without doubt, a heightened nervous irritability. Reflex action generally is increased. Neumann investigated the knee-jerk in 500 women during pregnancy, labor, and the puerperium, and in a large number found that there was a progressive exaggeration with the advance of pregnancy, little or no change being observed in the early months; sometimes when no change was observed during pregnancy the knee-jerk still increased during labor, reaching its maximum at the moment of the expulsion of the foetus; the return to the normal condition took place gradually during the puerperium. Tridandani found in

pregnant women that though the superficial reflexes, with the exception of the abdominal, were diminished, the deep and tendon reflexes were markedly increased, especially that of the knee, these changes being more marked in primiparae than in multiparae, and more pronounced as pregnancy advanced, the normal condition returning with ten days after labor. Electrical excitability was sensibly diminished.[181]

One of the first signs of high nervous tension is vomiting. As is well known, this phenomenon commonly appears early in pregnancy, and it is by many considered entirely physiological. Barnes regards it as a kind of safety valve, a regulating function, letting off excessive tension and maintaining equilibrium.[182] Vomiting is, however, a convulsion, and is thus the simplest form of a kind of manifestation--to which the heightened nervous tension of pregnancy easily lends itself--that finds its extreme pathological form in eclampsia. In this connection it is of interest to point out that the pregnant woman here manifests in the highest degree a tendency which is marked in women generally, for the female sex, apart altogether from pregnancy, is specially liable to convulsive phenomena.[183]

There is some slight difference of opinion among authorities as to the precise nature and causation of the sickness of pregnancy. Barnes, Horrocks and others regard it as physiological; but many consider it pathological; this is, for instance, the opinion of Giles. Graily Hewitt attributed it to flexion of the gravid uterus, Kaltenbach to hysteria, and Zaborsky terms it a neurosis. Whitridge Williams considers that it may be (1) reflex, or (2) neurotic (when it is allied to hysteria and amenable to suggestion), or (3) toxaemic. It really appears to lie on the borderland between healthy and diseased manifestations. It is said to be unknown to farmers and veterinary surgeons. It appears to be little known among savages; it is comparatively infrequent among women of the lower social classes, and, as Giles has found, women who habitually menstruate in a painless and normal manner suffer comparatively little from the sickness of pregnancy.

We owe a valuable study of the sickness of pregnancy to Giles, who analyzed the records of 300 cases. He concluded that about one-third of the pregnant women were free from sickness throughout pregnancy, 45 per cent. were free during the first three months. When sickness occurred it began in 70 per cent. of cases in the first month, and was most frequent during the second

month. The duration varied from a few days to all through. Between the ages of 20 and 25 sickness was least frequent, and there was less sickness in the third than in any other pregnancy. (This corresponds with the conclusion of Matthews Duncan that 25 is the most favorable age for pregnancy.) To some extent in agreement with Gueniot, Giles believes that the vomiting of pregnancy is "one form of manifestation of the high nervous irritability of pregnancy." This high nervous tension may overflow into other channels, into the vascular and excretory system, causing eclampsia; into the muscular system, causing chorea, or, expending itself in the brain, give rise to hysteria when mild or insanity when severe. But the vagi form a very ready channel for such overflow, and hence the frequency of sickness in pregnancy. There are thus three main factors in the causation of this phenomenon: (1) An increased nervous irritability; (2) a local source of irritation; (3) a ready efferent channel for nervous energy. (Arthur Giles, "Observations on the Etiology of the Sickness of Pregnancy," *Transactions Obstetrical Society of London*, vol. xxv, 1894.)

Martin, who regards the phenomenon as normal, points out that when nausea and vomiting are absent or suddenly cease there is often reason to suspect something wrong, especially the death of the embryo. He also remarks that women who suffer from large varicose veins are seldom troubled by the nausea of pregnancy. (J.M.H. Martin, "The Vomiting of Pregnancy," *British Medical Journal*, December 10, 1904.) These observations may be connected with those of Evans (*American Gynaecological and Obstetrical Journal*, January, 1900), who attributes primary importance to the undoubtedly active factor of the irritation set up by the uterus, more especially the rhythmic uterine contractions; stimulation of the breasts produces active uterine contractions, and Evans found that examination of the breasts sufficed to bring on a severe attack of vomiting, while on another occasion this was produced by a vaginal examination. Evans believes that the purpose of these contractions is to facilitate the circulation of the blood through the large venous sinuses, the surcharging of the relatively stagnant pools with effete blood producing the irritation which leads to rhythmic contractions.

It is on the basis of the increased vascular and glandular activity and the heightened nervous tension that the special psychic phenomena of

pregnancy develop. The best known, and perhaps the most characteristic of these manifestations, is that known as "longings." By this term is meant more or less irresistible desires for some special food or drink, which may be digestible or indigestible, sometimes a substance which the woman ordinarily likes, such as fruit, and occasionally one which, under ordinary circumstances, she dislikes, as in one case known to me of a young country woman who, when bearing her child, was always longing for tobacco and never happy except when she could get a pipe to smoke, although under ordinary circumstances, like other young women of her class, she was without any desire to smoke. Occasionally the longings lead to actions which are more unscrupulous than is common in the case of the same person at other times; thus in one case known to me a young woman, pregnant with her first child, insisted to her sister's horror on entering a strawberry field and eating a quantity of fruit. These "longings" in their extreme form may properly be considered as neurasthenic obsessions, but in their simple and less pronounced forms they may well be normal and healthy.

The old medical authors abound in narratives describing the longings of pregnant women for natural and unnatural foods. This affection was commonly called pica, sometimes citra or malatia. Schurig, whose works are a comprehensive treasure house of ancient medical lore, devotes a long chapter (cap. II) of his Chylologia, published in 1725, to pica as manifested mainly, though not exclusively, in pregnant women. Some women, he tells us, have been compelled to eat all sorts of earthy substances, of which sand seems the most common, and one Italian woman when pregnant ate several pounds of sand with much satisfaction, following it up with a draught of her own urine. Lime, mud, chalk, charcoal, cinders, pitch are also the desired substances in other cases detailed. One pregnant woman must eat bread fresh from the oven in very large quantities, and a certain noble matron ate 140 sweet cakes in one day and night. Wheat and various kinds of corn as well as of vegetables were the foods desired by many longing women. One woman was responsible for 20 pounds of pepper, another ate ginger in large quantities, a third kept mace under her pillow; cinnamon, salt, emulsion of almonds, treacle, mushrooms were desired by others. Cherries were longed for by one, and another ate 30 or 40 lemons in one night. Various kinds of fish--mullet, oysters, crabs, live eels, etc.--are mentioned, while other women have found delectation in lizards, frogs, spiders and flies, even scorpions, lice and fleas. A

pregnant woman, aged 33, of sanguine temperament, ate a live fowl completely with intense satisfaction. Skin, wool, cotton, thread, linen, blotting paper have been desired, as well as more repulsive substances, such as nasal mucus and feces (eaten with bread). Vinegar, ice, and snow occur in other cases. One woman stilled a desire for human flesh by biting the nates of children or the arms of men. Metals are also swallowed, such as iron, silver, etc. One pregnant woman wished to throw eggs in her husband's face, and another to have her husband throw eggs in her face.

In the next chapter of the same work Schurig describes cases of acute antipathy which may arise under the same circumstances (cap. III, "De Nausea seu Antipathia certorum ciborum"). The list includes bread, meat, fowls, fish, eels (a very common repulsion), crabs, milk, butter (very often), cheese (often), honey, sugar, salt, eggs, caviar, sulphur, apples (especially their odor), strawberries, mulberries, cinnamon, mace, capers, pepper, onions, mustard, beetroot, rice, mint, absinthe, roses (many pages are devoted to this antipathy), lilies, elder flowers, musk (which sometimes caused vomiting), amber, coffee, opiates, olive oil, vinegar, cats, frogs, spiders, wasps, swords.

More recently Gould and Pyle (*Anomalies and Curiosities of Medicine*, p. 80) have briefly summarized some of the ancient and modern records concerning the longings of pregnant women.

Various theories are put forward concerning the causation of the longings of pregnant women, but none of these seems to furnish by itself a complete and adequate explanation of all cases. Thus it is said that the craving is the expression of a natural instinct, the system of the pregnant woman really requiring the food she longs for. It is quite probable that this is so in many cases, but it is obviously not so in the majority of cases, even when we confine ourselves to the longings for fairly natural foods, while we know so little of the special needs of the organism during pregnancy that the theory in any case is insusceptible of clear demonstration.

Allied to this theory is the explanation that the longings are for things that counteract the tendency to nausea and sickness. Giles, however, in his valuable statistical study of the longings of a series of 300 pregnant women, has shown that the percentage of women with longings is exactly the

same (33 per cent.) among women who had suffered at some time during pregnancy from sickness as among the women who had not so suffered. Moreover, Giles found that the period of sickness frequently bore no relation to the time when there were cravings, and the patient often had cravings after the sickness had ceased.

According to another theory these longings are mainly a matter of auto-suggestion. The pregnant woman has received the tradition of such longings, persuades herself that she has such a longing, and then becomes convinced that, according to a popular belief, it will be bad for the child if the longing is not gratified. Giles considers that this process of auto-suggestion takes place "in a certain number, perhaps even in the majority of cases." [184]

The Duchess d'Abrantes, the wife of Marshal Junot, in her Memoires gives an amusing account of how in her first pregnancy a longing was apparently imposed upon her by the anxious solicitude of her own and her husband's relations. Though suffering from constant nausea and sickness, she had no longings. One day at dinner after the pregnancy had gone on for some months her mother suddenly put down her fork, exclaiming: "I have never asked you what longing you have!" She replied with truth that she had none, her days and her nights being occupied with suffering. "No envie!" said the mother, "such a thing was never heard of. I must speak to your mother-in-law." The two old ladies consulted anxiously and explained to the young mother how an unsatisfied longing might produce a monstrous child, and the husband also now began to ask her every day what she longed for. Her sister-in-law, moreover, brought her all sorts of stories of children born with appalling mother's marks due to this cause. She became frightened and began to wonder what she most wanted, but could think of nothing. At last, when eating a pastille flavored with pineapple, it occurred to her that pineapple is an excellent fruit, and one, moreover, which she had never seen, for at that time it was extremely rare. Thereupon she began to long for pineapple, and all the more when she was told that at that season they could not be obtained. She now began to feel that she must have pineapple or die, and her husband ran all over Paris, vainly offering twenty louis for a pineapple. At last he succeeded in obtaining one through the kindness of Mme. Bonaparte, and drove home furiously just as his wife, always talking of pineapples, had gone to bed. He entered the room with

the pineapple, to the great satisfaction of the Duchess's mother. (In one of her own pregnancies, it appears, she longed in vain for cherries in January, and the child was born with a mark on her body resembling a cherry--in scientific terminology, a _naevus_.) The Duchess effusively thanked her husband and wished to eat of the fruit immediately, but her husband stopped her and said that Corvisart, the famous physician, had told him that she must on no account touch it at night, as it was extremely indigestible. She promised not to do so, and spent the night in caressing the pineapple. In the morning the husband came and cut up the fruit, presenting it to her in a porcelain bowl. Suddenly, however, there was a revulsion of feeling; she felt that she could not possibly eat pineapple; persuasion was useless; the fruit had to be taken away and the windows opened, for the very smell of it had become odious. The Duchess adds that henceforth, throughout her life, though still liking the flavor, she was only able to eat pineapple by doing a sort of violence to herself. (_Memories de la Duchesse d'Abrantes_, vol. iii, Chapter VIII.) It should be added that, in old age, the Duchess d'Abrantes appears to have become insane.

The influence of suggestion must certainly be accepted as, at all events, increasing and emphasizing the tendency to longings. It can scarcely, however, be regarded as a radical and adequate explanation of the phenomenon generally. If it is a matter of auto-suggestion due to a tradition, then we should expect to find longings most frequent and most pronounced in multiparous women, who are best acquainted with the tradition and best able to experience all that is expected of a pregnant woman. But, as a matter of fact, the women who have borne most children are precisely those who are least likely to be affected by the longings which tradition demands they should manifest. Giles has shown that longings occur much more frequently in the first than in any subsequent pregnancy; there is a regular decrease with the increase in number of pregnancies until in women with ten or more children the longings scarcely occur at all.

We must probably regard longings as based on a physiological and psychic tendency which is of universal extension and almost or quite normal. They are known throughout Europe and were known to the medical writers of antiquity. Old Indian as well as old Jewish physicians recognized them. They have been noted among many savage races to-day: among the Indians of North and South America, among the peoples of the Nile and the Soudan, in

the Malay archipelago.[185] In Europe they are most common among the women of the people, living simple and natural lives.[186]

The true normal relationship of the longings of pregnancy is with the impulsive and often irresistible longings for food delicacies which are apt to overcome children, and in girls often persist or revive through adolescence and even beyond. Such sudden fits of greediness belong to those kind of normal psychic manifestations which are on the verge of the abnormal into which they occasionally pass. They may occur, however, in healthy, well-bred, and well-behaved children who, under the stress of the sudden craving, will, without compunction and apparently without reflection, steal the food they long for or even steal from their parents the money to buy it. The food thus seized by a well-nigh irresistible craving is nearly always a fruit. Fruit is usually doled out to children in small quantities as a luxury, but we are descended from primitive human peoples and still more remote ape-like ancestors, by whom fruit was in its season eaten copiously, and it is not surprising that when that season comes round the child, more sensitive than the adult to primitive influences, should sometimes experience the impulse of its ancestors with overwhelming intensity, all the more so if, as is probable, the craving is to some extent the expression of a physiological need.

Sanford Bell, who has investigated the food impulses of children in America, finds that girls have a greater number of likes and dislikes in foods than boys of the same age, though at the same time they have less dislikes to some foods than boys. The proclivity for sweets and fruits shows itself as soon as a child begins to eat solids. The chief fruits liked are oranges, bananas, apples, peaches, and pears. This strong preference for fruits lasts till the age of 13 or 14, though relatively weaker from 10 to 13. In girls, however, Bell notes the significant fact from our present point of view that at mid-adolescence there is a revived taste for sweets and fruits. He believes that the growth of children in taste in foods recapitulates the experience of the race. (S. Bell, "An Introductory Study of the Psychology of Foods." _Pedagogical Seminary_, March, 1904.)

The heightened nervous impressionability of pregnancy would appear to arouse into activity those primitive impulses which are liable to occur in childhood and in the unmarried girl continue to the nubile age. It is a significant fact that the longings of pregnant women are mainly for fruit, and notably for so wholesome a fruit as the apple, which may very well

have a beneficial effect on the system of the pregnant woman. Giles, in his tabulation of the foods longed for by 300 pregnant women, found that the fruit group was by far the largest, furnishing 79 cases; apples were far away at the head, occurring in 34 cases out of the 99 who had longings, while oranges followed at a distance (with 13 cases), and in the vegetable group tomatoes came first (with 6 cases). Several women declared "I could have lived on apples," "I was eating apples all day," "I used to sit up in bed eating apples." [187] Pregnant women appear seldom to long for the possession of objects outside the edible class, and it seems doubtful whether they have any special tendency to kleptomania. Pinard has pointed out that neither Lasegue nor Lunier, in their studies of kleptomania, have mentioned a single shop robbery committed by a pregnant woman. [188] Brouardel has indeed found such cases, but the object stolen was usually a food.

A further significant fact connecting the longings of pregnant women with the longings of children is to be found in the fact that they occur mainly in young women. We have, indeed, no tabulation of the ages of pregnant women who have manifested longings, but Giles has clearly shown that these chiefly occur in primiparae, and steadily and rapidly decrease in each successive pregnancy. This fact, otherwise somewhat difficult of explanation, is natural if we look upon the longings of pregnancy as a revival of those of childhood. It certainly indicates also that we can by no means regard these longings as exclusively the expression of a physiological craving, for in that case they would be liable to occur in any pregnancy unless, indeed, it is argued that with each successive pregnancy the woman becomes less sensitive to her own physiological state.

There has been a frequent tendency, more especially among primitive peoples, to regard a pregnant woman's longings as something sacred and to be indulged, all the more, no doubt, as they are usually of a simple and harmless character. In the Black Forest, according to Ploss and Bartels, a pregnant woman may go freely into other people's gardens and take fruit, provided she eats it on the spot, and very similar privileges are accorded to her elsewhere. Old English opinion, as reflected, for instance, in Ben Jonson's plays (as Dr. Harriet C.B. Alexander has pointed out), regards the pregnant woman as not responsible for her longings, and Kiernan remarks ("Kleptomania and Collectivism," Alienist and Neurologist, November, 1902) that this is in "a most natural and just view." In France at the Revolution a law of the 28th Germinal, in the year III, to some extent admitted the

irresponsibility of the pregnant woman generally,--following the classic precedent, by which a woman could not be brought before a court of justice so long as she was pregnant,--but the Napoleonic code, never tender to women, abrogated this. Pinard does not consider that the longings of pregnant women are irresistible, and, consequently, regards the pregnant woman as responsible. This is probably the view most widely held. In any case these longings seldom come up for medico-legal consideration.

The phenomena of the longings of pregnancy are linked to the much more obscure and dubious phenomena of the influence of maternal impressions on the child within the womb. It is true, indeed, that there is no real connection whatever between these two groups of manifestations, but they have been so widely and for so long closely associated in the popular mind that it is convenient to pass directly from one to the other. The same name is sometimes given to the two manifestations; thus in France a pregnant longing is an envie, while a mother's mark on the child is also called an envie, because it is supposed to be due to the mother's unsatisfied longing.

The conception of a "maternal impression" (the German Versehen) rests on the belief that a powerful mental influence working on the mother's mind may produce an impression, either general or definite, on the child she is carrying. It makes a great deal of difference whether the effect of the impression on the child is general, or definite and circumscribed. It is not difficult to believe that a general effect--even, as Sir Arthur Mitchell first gave good reason for believing, idiocy--may be produced on the child by strong and prolonged emotional influence working on the mother, because such general influence may be transmitted through a deteriorated blood-stream. But it is impossible at present to understand how a definite and limited influence working on the mother could produce a definite and limited effect on the child, for there are no channels of nervous communications for the passage of such influences. Our difficulty in conceiving of the process must, however, be put aside if the fact itself can be demonstrated by convincing evidence.

In order to illustrate the nature of maternal impressions, I will summarize a few cases which I have collected from the best medical periodical literature during the past fifteen years. I have exercised no selection and in no way guarantee the authenticity of the alleged facts or the alleged explanation. They are merely examples to illustrate a class of cases published

from time to time by medical observers in medical journals of high repute.

Early in pregnancy a woman found her pet rabbit killed by a cat which had gnawed off the two forepaws, leaving ragged stumps; she was for a long time constantly thinking of this. Her child was born with deformed feet, one foot with only two toes, the other three, the os calcis in both feet being either absent or little developed. (G.B. Beale, Tottenham, Lancet, May 4, 1889).

Three months and a half before birth of the child the father, a glazier, fell through the roof of a hothouse, severely cutting his right arm, so that he was lying in the infirmary for a long time, and it was doubtful whether the hand could be saved. The child was healthy, but on the flexor surface of the radial side of the right forearm just above the wrist--the same spot as the father's injury--there was a naevus the size of a sixpence. (W. Russell, Paisley, Lancet, May 11, 1889.)

At the beginning of pregnancy a woman was greatly scared by being kicked over by a frightened cow she was milking; she hung on to the animal's teats, but thought she would be trampled to death, and was ill and nervous for weeks afterwards. The child was a monster, with a fleshy substance--seeming to be prolonged from the spinal cord and to represent the brain--projecting from the floor of the skull. Both doctor and nurse were struck by the resemblance to a cow's teats before they knew the woman's story, and this was told by the woman immediately after delivery and before she knew to what she had given birth. (A. Ross Paterson, Reversby, Lincolnshire, Lancet, September 29, 1889.)

During the second month of pregnancy the mother was terrified by a bullock as she was returning from market. The child reached full term and was a well-developed male, stillborn. Its head "exactly resembled a miniature cow's head;" the occipital bone was absent, the parietals only slightly developed, the eyes were placed at the top of the frontal bone, which was quite flat, with each of its superior angles twisted into a rudimentary horn. (J.T. Hislop, Tavistock, Devon, Lancet, November 1, 1890.)

When four months pregnant the mother, a multipara of 30, was startled by a black and white collie dog suddenly pushing against

her and rushing out when she opened the door. This preyed on her mind, and she felt sure her child would be marked. The whole of the child's right thigh was encircled by a shining black mole, studded with white hairs; there was another mole on the spine of the left scapula. (C.F. Williamson, Horley, Surrey, Lancet, October 11, 1890.)

A lady in comfortable circumstances, aged 24, not markedly emotional, with one child, in all respects healthy, early in her pregnancy saw a man begging whose arms and legs were "all doubled up." This gave her a shock, but she hoped no ill effects would follow. The child was an encephalous monster, with the extremities rigidly flexed and the fingers clenched, the feet almost sole to sole. In the next pregnancy she frequently passed a man who was a partial cripple, but she was not unduly depressed; the child was a counterpart of the last, except that the head was normal. The next child was strong and well formed. (C.W. Chapman, London, Lancet, October 18, 1890.)

When the pregnant mother was working in a hayfield her husband threw at her a young hare he had found in the hay; it struck her on the cheek and neck. Her daughter has on the left cheek an oblong patch of soft dark hair, in color and character clearly resembling the fur of a very young hare. (A. Mackay, Port Appin, N.B., Lancet, December 19, 1891. The writer records also four other cases which have happened in his experience.)

When the mother was pregnant her husband had to attend to a sow who could not give birth to her pigs; he bled her freely, cutting a notch out of both ears. His wife insisted on seeing the sow. The helix of each ear of her child at birth was gone, for nearly or quite half an inch, as if cut purposely. (R.P. Roons, Medical World, 1894.)

A lady when pregnant was much interested in a story in which one of the characters had a supernumerary digit, and this often recurred to her mind. Her baby had a supernumerary digit on one hand. (J. Jenkyns, Aberdeen, British Medical Journal, March 2, 1895. The writer also records another case.)

When pregnant the mother saw in the forest a new-born fawn which was a double monstrosity. Her child was a similar double

monstrosity (_cephalothora copagus_). (Hartmann, _Muenchener Medicinisches Wochenschrift_, No. 9, 1895.)

A well developed woman of 30, who had ten children in twelve years, in the third month of her tenth pregnancy saw a child run over by a street car, which crushed the upper and back part of its head. Her own child was anencephalic and acranial, with entire absence of vault of skull. (F.A. Stahl, _American Journal of Obstetrics_, April, 1896.)

A healthy woman with no skin blemish had during her third pregnancy a violent appetite for sunfish. During or after the fourth month her husband, as a surprise, brought her some sunfish alive, placing them in a pail of water in the porch. She stumbled against the pail and the shock caused the fish to flap over the pail and come in violent contact with her leg. The cold wriggling fish produced a nervous shock, but she attached no importance to this. The child (a girl) had at birth a mark of bronze pigment resembling a fish with the head uppermost (photograph given) on the corresponding part of the same leg. Daughter's health good; throughout life she has had a strong craving for sunfish, which she has sometimes eaten till she has vomited from repletion. (C.F. Gardiner, Colorado Springs, _American Journal Obstetrics_, February, 1898.)

The next case occurred in a bitch. A thoroughbred fox terrier bitch strayed and was discovered a day or two later with her right foreleg broken. The limb was set under chloroform with the help of Roentgen rays, and the dog made a good recovery. Several weeks later she gave birth to a puppy with a right foreleg that was ill-developed and minus the paw. (J. Booth, Cork, _British Medical Journal_, September 16, 1899.)

Four months before the birth of her child a woman with four healthy children and no history of deformity in the family fell and cut her left wrist severely against a broken bowl; she had a great fright and shock. Her child, otherwise perfect, was born without left hand and wrist, the stump of arm terminating at lower end of radius and ulna. (G. Ainslie Johnston, Ambleside, _British Medical Journal_, April 18, 1903.)

The belief in the reality of the transference of strong mental or physical

impressions on the mother into physical changes in the child she is bearing is very ancient and widespread. Most writers on the subject begin with the book of Genesis and the astute device of Jacob in influencing the color of his lambs by mental impressions on his ewes. But the belief exists among even more primitive people than the early Hebrews, and in all parts of the world.[189] Among the Greeks there is a trace of the belief in Hippocrates, the first of the world's great physicians, while Soranus, the most famous of ancient gynaecologists, states the matter in the most precise manner, with instances in proof. The belief continued to persist unquestioned throughout the Middle Ages. The first author who denied the influence of maternal impressions altogether appears to have been the famous anatomist, Realdus Columbus, who was a professor at Padua, Pisa, and Rome at the beginning of the sixteenth century. In the same century, however, another and not less famous Neapolitan, Della Porta, for the first time formulated a definite theory of maternal impressions. A little later, early in the seventeenth century, a philosophic physician at Padua, Fortunatus Licetus, took up an intermediate position which still finds, perhaps reasonably, a great many adherents. He recognized that a very frequent cause of malformation in the child is to be found in morbid antenatal conditions, but at the same time was not prepared to deny absolutely and in every case the influence of maternal impression on such conditions. Malebranche, the Platonic philosopher, allowed the greatest extension to the power of the maternal imagination. In the eighteenth century, however, the new spirit of free inquiry, of radical criticism, and unfettered logic, led to a sceptical attitude toward this ancient belief then flourishing vigorously.[190] In 1727, a few years after Malebranche's death, James Blondel, a physician of extreme acuteness, who had been born in Paris, was educated at Leyden, and practiced in London, published the first methodical and thorough attack on the doctrine of maternal impressions, *The Strength of Imagination of Pregnant Women Examined*, and exercised his great ability in ridiculing it. Haller, Roederer, and Soemmering followed in the steps of Blondel, and were either sceptical or hostile to the ancient belief. Blumenbach, however, admitted the influence of maternal impressions. Erasmus Darwin, as well as Goethe in his *Wahlverwandtschaften*, even accepted the influence of paternal impressions on the child. By the beginning of the nineteenth century the majority of physicians were inclined to relegate maternal impressions to the region of superstition. Yet the exceptions were of notable importance. Burdach, when all deductions were made, still found it necessary to retain the belief in maternal impressions, and Von Baer, the founder of embryology, also accepted it, supported by a case, occurring in his own sister, which he was able to investigate before the child's birth. L.W.T.

Bischoff, also, while submitting the doctrine to acute criticism, found it impossible to reject maternal impressions absolutely, and he remarked that the number of adherents to the doctrine was showing a tendency to increase rather than diminish. Johannes Mueller, the founder of modern physiology in Germany, declared himself against it, and his influence long prevailed; Valentin, Rudolf Wagner, and Emil du Bois-Reymond were on the same side. On the other hand various eminent gynaecologists--Litzmann, Roth, Hennig, etc.--have argued in favor of the reality of maternal impressions.[191]

The long conflict of opinion which has taken place over this opinion has still left the matter unsettled. The acutest critics of the ancient belief constantly conclude the discussion with an expression of doubt and uncertainty. Even if the majority of authorities are inclined to reject maternal impressions, the scientific eminence of those who accept them makes a decisive opinion difficult. The arguments against such influence are perfectly sound: (1) it is a primitive belief of unscientific origin; (2) it is impossible to conceive how such influence can operate since there is no nervous connection between mother and child; (3) comparatively few cases have been submitted to severe critical investigation; (4) it is absurd to ascribe developmental defects to influences which arise long after the foetus had assumed its definite shape[192]; (5) in any case the phenomenon must be rare, for William Hunter could not find a coincidence between maternal impressions and foetal marks through a period of several years, and Bischoff found no case in 11,000 deliveries. These statements embody the whole of the argument against maternal impressions, yet it is clear that they do not settle the matter. Edgar, in a manual of obstetrics which is widely regarded as a standard work, states that this is "yet a mooted question." [193] Ballantyne, again, in a discussion of this influence at the Edinburgh Obstetrical Society, summarizing the result of a year's inquiry, concluded that it is still "sub judice." [194] In a subsequent discussion of the question he has somewhat modified his opinion, and is inclined to deny that definite impressions on the pregnant woman's mind can cause similar defects in the foetus; they are "accidental coincidences," but he adds that a few of the cases are difficult to explain away. At the same time he fully believes that prolonged and strongly marked mental states of the mother may affect the development of the foetus in her uterus, causing vascular and nutritive disturbances, irregularities of development, and idiocy.[195]

Whether and in how far mental impressions on the mother can produce definite mental and emotional disposition in the child is a special aspect of the question to which scarcely any inquiry

has been devoted. So distinguished a biologist as Mr. A.W. Wallace has, however, called attention to this point, bringing forward evidence on the question and emphasizing the need of further investigation. "Such transmission of mental influence," he remarks, "will hardly be held to be impossible or even very improbable," (A.W. Wallace, "Prenatal Influences on Character," Nature, August 24, 1893.)

It has already been pointed out that a large number of cases of foetal deformities, supposed to be due to maternal impressions, cannot possibly be so caused because the impression took place at a period when the development of the foetus must already have been decided. In this connection, however, it must be noted that Dabney has observed a relationship between the time of supposed mental impressions and the nature of the actual defect which is of considerable significance as an argument in favor of the influence of mental impressions. He tabulated 90 carefully reported cases from recent medical literature, and found that 21 of them were concerned with defects of structure of the lips and palate. In all but 2 of these 21 the defect was referred to an impression occurring within the first three months of pregnancy. This is an important point as showing that the assigned cause really falls within a period when a defect of development actually could produce the observed result, although the person reporting the cases was in many instances manifestly ignorant of the details of embryology and teratology. There was no such preponderance of early impressions among the defects of skin and hair which might well, so far as development is concerned, have been caused at a later period; here, in 7 out of 15 cases, it was distinctly stated that the impression was made later than the fourth month.[196]

It would seem, on the whole, that while the influence of maternal impressions in producing definite effects on the child within the womb has by no means been positively demonstrated, we are not entitled to reject it with any positive assurance. Even if we accept it, however, it must remain, for the present, an inexplicable fact; the modus operandi we can scarcely even guess at. General influences from the mother on the child we can easily conceive of as conveyed by the mother's blood; we can even suppose that the modified blood might act specifically on one particular kind of tissue. We can, again, as suggested by Fere, very well believe that the maternal emotions act upon the womb and produce various kinds and degrees of pressure on the child within, so that the apparently active movements of the foetus may be really consecutive on unconscious maternal excitations.[197] We may also believe that, as suggested by John Thomson,

there are slight incoordinations in utero, a kind of developmental neurosis, produced by some slight lack of harmony of whatever origin, and leading to the production of malformations.[198] We know, finally, that, as Fere and others have repeatedly demonstrated during recent years by experiments on chickens, etc., very subtle agents, even odors, may profoundly affect embryonic development and produce deformity. But how the mother's psychic disposition can, apart from heredity, affect specifically the physical conformation or even the psychic disposition of the child within her womb must remain for the present an insoluble mystery, even if we feel disposed to conclude that in some cases such action seems to be indicated.

In comprehending such a connection, however at present undemonstrated, it may well be borne in mind that the relationship of the mother to the child within her womb is of a uniquely intimate character. It is of interest in this connection to quote some remarks by an able psychologist, Dr. Henry Rutgers Marshall; the remarks are not less interesting for being brought forward without any connection with the question of maternal impressions: "It is true that, so far as we know, the nervous system of the embryo never has a direct connection with the nervous system of the mother: nevertheless, as there is a reciprocity of reaction between the physical body of the mother and its embryonic parasite, the relation of the embryonic nervous system to the nervous system of the mother is not very far removed from the relation of the pre-eminent part of the nervous system of a man to some minor nervous system within his body which is to a marked extent dissociated from the whole neural mass.

"Correspondingly, then, and within the consciousness of the mother, there develops a new little minor consciousness which, although but lightly integrated with the mass of her consciousness, nevertheless has its part in her consciousness taken as a whole, much as the psychic correspondents of the action of the nerve which govern the secretions of the glands of the body have their part in her consciousness taken as a whole.

"It is very much as if the optic ganglia developed fully in themselves, without any closer connection with the rest of the brain than existed at their first appearance. They would form a little complex nervous system almost but not quite apart from the

brain system; and it would be difficult to deny them a consciousness of their own; which would indeed form part of the whole consciousness of the individual, but which would be in a manner self-dependent." It must, if this is so, be said that before birth, on the psychic side, the embryo's activities "form part of a complex consciousness which is that of the mother and embryo together." "Without subscribing to the strange stories of telepathy, of the solemn apparition of a person somewhere at the moment of his death a thousand miles away, of the unquiet ghost haunting the scenes of its bygone hopes and endeavors, one may ask" (with the author of the address in medicine at the Leicester gathering of the British Medical Association, British Medical Journal, July 29, 1905) "whether two brains cannot be so tuned in sympathy as to transmit and receive a subtle transfusion of mind without mediation of sense. Considering what is implied by the human brain with its countless millions of cells, its complexities of minute structure, its innumerable chemical compositions, and the condensed forces in its microscopic and ultramicroscopic elements--the whole a sort of microcosm of cosmic forces to which no conceivable compound of electric batteries is comparable; considering, again, that from an electric station waves of energy radiate through the viewless air to be caught up by a fit receiver a thousand miles distant, it is not inconceivable that the human brain may send off still more subtle waves to be accepted and interpreted by the fitly tuned receiving brain. Is it, after all, mere fancy that a mental atmosphere or effluence emanates from one person to affect another, either soothing sympathetically or irritating antipathically?" These remarks (like Dr. Marshall's) were made without reference to maternal impressions, but it may be pointed out that under no conceivable circumstance could we find a brain in so virginal and receptive a state as is the child's in the womb.

On the whole we see that pregnancy induces a psychic state which is at once, in healthy persons, one of full development and vigor, and at the same time one which, especially in individuals who are slightly abnormal, is apt to involve a state of strained or overstrained nervous tension and to evoke various manifestations which are in many respects still imperfectly understood. Even the specifically sexual emotions tend to be heightened, more especially during the earlier period of pregnancy. In 24 cases of pregnancy in which the point was investigated by Harry Campbell,

sexual feeling was decidedly increased in 8, in one case (of a woman aged 31 who had had four children) being indeed only present during pregnancy, when it was considerable; in only 7 cases was there diminution or disappearance of sexual feeling.[199] Pregnancy may produce mental depression;[200] but on the other hand it frequently leads to a change of the most favorable character in the mental and general well-being. Some women indeed are only well during pregnancy. It is remarkable that some women who habitually suffer from various nervous troubles--neuralgias, gastralgia, headache, insomnia--are only free from them at this moment. This "paradox of gestation," as Vinay has termed it, is specially marked in the hysterical and those suffering from slight nervous disorders, but it is by no means universal, so that although it is possible, Vinay states, to confirm the opinion of the ancients as to the beneficial action of marriage on hysteria, that is only true of slight cases and scarcely enables us to counsel marriage in hysteria.[201] Even a woman's intelligence is sometimes heightened by pregnancy, and Tarnier, as quoted by Vinay, knew many women whose intelligence, habitually somewhat obtuse, has only risen to the normal level during pregnancy.[202] The pregnant woman has reached the climax of womanhood; she has attained to that state toward which the periodically recurring menstrual wave has been drifting her at regular intervals throughout her sexual life[203]; she has achieved that function for which her body has been constructed, and her mental and emotional disposition adapted, through countless ages.

And yet, as we have seen, our ignorance of the changes effected by the occurrence of this supremely important event--even on the physical side--still remains profound. Pregnancy, even for us, the critical and unprejudiced children of a civilized age, still remains, as for the children of more primitive ages, a mystery. Conception itself is a mystery for the primitive man, and may be produced by all sorts of subtle ways apart from sexual connection, even by smelling a flower.[204] The pregnant woman was surrounded by ceremonies, by reverence and fear, often shut up in a place apart.[205] Her presence, her exhalations, were of extreme potency; even in some parts of Europe to-day, as in the Walloon districts of Belgium, a pregnant woman must not kiss a child for her breath is dangerous, or urinate on plants for she will kill them.[206] The mystery has somewhat changed its form; it still remains. The future of the race is bound up with our efforts to fathom the mystery of pregnancy. "The early days of human life," it has been truly said, "are entirely one with the mother. On her manner of life--eating, drinking, sleeping, and thinking--what greatness may not hang?"[207] Schopenhauer observed, with misapplied horror, that there is nothing a woman is less modest about than

the state of pregnancy, while Weininger exclaims: "Never yet has a pregnant woman given expression in any form--poem, memoirs, or gynaecological monograph--to her sensations or feelings." [208] Yet when we contemplate the mystery of pregnancy and all that it involves, how trivial all such considerations become! We are here lifted into a region where our highest intelligence can only lead us to adoration, for we are gazing at a process in which the operations of Nature become one with the divine task of Creation.

FOOTNOTES:

[169] See, e.g., Groos, *_AEsthetische Genuss_*, p. 249. "We have to admit," Groos observes, "the entrance of another instinct, the impulse to tend and foster, so closely connected with the sexual life. It is seemingly due to the co-operation of this impulse that the little female bird during courtship is so often fed by the male like a young fledgling. In man 'love' from the biological standpoint is also an amalgamation of two needs; when the tender need to protect and foster and serve is lacking the emotion is not quite perfect. Heine's expression, 'With my mantle I protect you from the storm,' has always seemed to me very characteristic." Sometimes the sexual impulse may undergo a complete transformation in this direction. "I believe there is really a tendency in women," a lady writes in a letter, "to allow maternal feeling to take the place of sexual feeling. Very often a woman's feeling for her husband becomes this (though he may be twenty years older than herself); sometimes it does not, remaining purely sex feeling. Sometimes it is for some other man she has this curious self-obliterating maternal feeling. It is not necessarily connected with sex intercourse. A prostitute, who has relations with dozens of men, may have it for some feeble drunken fool, who perhaps goes after other women. I once saw the change from sex feeling to mother feeling, as I call it, come almost suddenly over a woman after she had lived about four years with a man who was unfaithful to her. Then, when all real sex feeling, the hatred of the woman he followed, the desire he should give her love and tenderness, had all gone, came the other feeling, and she said to me, 'You don't understand at all; he's only my little baby; nothing he does can make any difference to me now.' As I grow older and understand women's natures better, I can see almost at once which relation it is a woman has to her husband, or any given man. It is this feeling, and not sex passion, that keeps woman from being free." Not only is there a sexual association in the impulse to foster and protect, there would appear to be a similar element also in the response to that impulse.

Freud has especially insisted on the partly sexual character of the child's feelings for those who care for it and tend it and satisfy its needs. It is begun in earliest infancy; "whoever has seen the sated infant sink back from the breast, to fall asleep with flushed cheeks and happy smile, must say that the picture is adequate to the expression of the sexual satisfaction of later life." The lips, moreover, are the earliest erogenous zone. "There will, perhaps, be some opposition," Freud remarks (*_Drei Abhandlungen zur Sexualtheorie_*, pp. 36, 64), "to the identification of the child's feelings of tenderness and appreciation for those who tend it with sexual love, but I believe that exact psychological analysis will place the identity beyond doubt. The relationship of the child with the person who tends it is for it a continual source of sexual excitement and satisfaction flowing from the erogenous zones, especially since the fostering person--as a rule the mother--regards the child with emotions which proceed from her sexual life; strokes it, kisses it, rocks it, and very plainly treats it as a compensation for a fully valid sexual object." Freud remarks that girls who retain the childish character of their love for their parents to adult age are apt to make cold wives and to be sexually anaesthetic.

[170] Esbach (in his *_These de Paris_*, published in 1876) showed that even the finger nails are affected in pregnancy and become measurably thinner.

[184] Arthur Giles, "The Longings of Pregnant Women," *Transactions Obstetrical Society of London*, vol. xxxv, 1893.

[185] Ploss and Bartels, *Das Weib*, Chapter XXX.

[186] Thus, in Cornwall, "to be in the longing way" is a popular synonym for pregnancy.

[187] The apple, wherever it is known, has nearly always been a sacred or magic fruit (as J.F. Campbell shows, *Popular Tales of West Highlands*, vol. I, p. lxxv. et seq.), and the fruit of the forbidden tree which tempted Eve is always popularly imagined to be an apple. One may perhaps refer in this connection to the fact that at Rome and elsewhere the testicles have been called apples. I may add that we find a curious proof of the recognition of the feminine love of apples in an old Portuguese

ballad, "Donna Guimar," in which a damsel puts on armour and goes to the wars; her sex is suspected and as a test, she is taken into an orchard, but Donna Guimar is too wary to fall into the trap, and turning away from the apples plucks a citron.

[188] A. Pinard, Art. "Grossesse," *Dictionnaire Encyclopedique des Sciences Medicales*, p. 138. On the subject of violent, criminal and abnormal impulses during pregnancy, see Cumston, "Pregnancy and Crime," *American Journal Obstetrics*, December, 1903.

[189] See especially Ploss and Bartels, *Das Weib*, vol. i, Chapter XXXI. Ballantyne in his work on the pathology of the foetus adds Loango negroes, the Eskimo and the ancient Japanese.

[190] In 1731 Schurig, in his *Syllepsilogia*, devoted more than a hundred pages (cap. IX) to summarizing a vast number of curious cases of maternal impressions leading to birth-marks of all kinds.

[191] J.W. Ballantyne has written an excellent history of the doctrine of maternal impressions, reprinted in his *Manual of Antenatal Pathology: The Embryo*, 1904, Chapter IX; he gives a bibliography of 381 items. In Germany the history of the question has been written by Dr. Iwan Bloch (under the pseudonym of Gerhard von Welsenburg), *Das Versehen der Frauen*, 1899. Cf., in French, G. Variot, "Origine des Prejuges Populaires sur les Envies," *Bulletin Societe d'Anthropologie*, Paris, June 18, 1891. Variot rejects the doctrine absolutely, Bloch accepts it, Ballantyne speaks cautiously.

[192] J.G. Kiernan has shown how many of the alleged cases are negatived by the failure to take this fact into consideration. (*Journal of American Medical Association*, December 9, 1899.)

[193] J. Clifton Edgar, *The Practice of Obstetrics*, second edition, 1904, p. 296. In an important discussion of the question at the American Gynaecological Society in 1886, introduced by Fordyce Barker, various eminent gynaecologists declared in favor of the doctrine, more or less cautiously. (*Transactions of the American Gynaecological Society*, vol. xi, 1886, pp. 152-196.) Gould and Pyle, bringing forward some of the data on the question (*Anomalies and Curiosities of Medicine*, pp. 81, *et seq.*) state that the reality of the influence of maternal impressions seems fully established. On the other side, see G.W. Cook, *American Journal of Obstetrics*, September, 1889, and H.F. Lewis, *ib.*, July, 1899.

[194] _Transactions Edinburgh Obstetrical Society_, vol. xvii, 1892.

[195] J.W. Ballantyne, _Manual of Antenatal Pathology: The Embryo_, p. 45.

[196] W.C. Dabney, "Maternal Impressions," Keating's _Cyclopaedia of Diseases of Children_, vol. i, 1889, pp. 191-216.

[197] Fere, _Sensation et Mouvement_, Chapter XIV, "Sur la Psychologie du Foetus."

[198] J. Thomson, "Defective Co-ordination in Utero," _British Medical Journal_, September 6, 1902.

[199] H. Campbell, _Nervous Organization of Man and Woman_, p. 206; cf. Moll, _Untersuchungen ueber die Libido Sexualis_, bd. i, p. 264. Many authorities, from Soranus of Ephesus onward, consider, however, that sexual relations should cease during pregnancy, and certainly during the later months. Cf. Brenot, _De l'influence de la copulation pendant la grossesse_, 1903.

[200] Bianchi terms this fairly common condition the neurasthenia of pregnancy.

[201] Vinay, _Traite des Maladies de la Grossesse_, 1894, pp. 51, 577; Mongeri, "Nervenkrankungen und Schwangerschaft." _Allegemeine Zeitschrift fuer Psychiatrie_, bd. LVIII, Heft 5. Haig remarks (_Uric Acid_, sixth edition, p. 151) that during normal pregnancy diseases with excess of uric acid in the blood (headaches, fits, mental depression, dyspepsia, asthma) are absent, and considers that the common idea that women do not easily take colds, fevers, etc., at this time is well founded.

[202] Founding his remarks on certain anatomical changes and on a suggestion of Engel's, Donaldson observes: "It is impossible to escape the conclusion that in women natural education is complete only with maternity, which we know to effect some slight changes in the sympathetic system and possibly the spinal cord, and which may be fairly laid under suspicion of causing more structural modifications than are at present recognized." H.H. Donaldson, _The Growth of the Brain_, p. 352.

[203] The state of menstruation is in many respects an approximation to that of pregnancy; see, e.g., Edgar's _Practice of Obstetrics_, plates 6 6

and 7, showing the resemblance of the menstrual changes in the breasts and the external sexual parts to the changes of pregnancy; cf. Havelock Ellis, Man and Woman, fourth edition, Chapter XI, "The Functional Periodicity of Woman."

[204] Thus the gypsies say of an unmarried woman who becomes pregnant, "She has smelt the moon-flower"--a flower believed to grow on the so-called moon-mountain and to possess the property of impregnating by its smell. Ploss and Bartels, Das Weib, bd. I, Chapter XXVII.

[205] This was a sound instinct, for it is now recognized as an extremely important part of puericulture that a woman should rest at all events during the latter part of pregnancy; see, e.g., Pinard, Gazette des Hopitaux, November 28, 1895, and Annales de Gynecologie, August, 1898.

[206] Ploss and Bartels, op. cit., Chapter XXIX; Kryptadia, vol. viii, p. 143.

[207] Griffith Wilkin, British Medical Journal, April 8, 1905.

[208] Weininger, Geschlecht und Charakter, p. 107. I may remark that a recent book, Ellis Meredith's Heart of My Heart, is devoted to a seemingly autobiographical account of a pregnant woman's emotions and ideas. The relations of maternity to intellectual work have been carefully and impartially investigated by Adele Gerhard and Helena Simon, who seem to conclude that the conflict between the inevitable claims of maternity and the scarcely less inevitable claims of the intellectual life cannot be avoided.

APPENDIX.

HISTORIES OF SEXUAL DEVELOPMENT.

HISTORY I.--The following narrative has been written by a university man trained in psychology:--

So far as I have been able to learn, none of my ancestors for at least three generations have suffered from any nervous or mental disease; and of those more remote I can learn nothing at all. It

appears probable, then, that any peculiarities of my own sexual development must be explained by reference to the somewhat peculiar environment.

I was the first child and was, naturally, somewhat spoiled--a process which tended to increase my natural tendency to sentimentality. On the other hand, I was shy and undemonstrative with all except my nearest relatives, and with them as well after my seventh or eighth year. And here it may be well to describe my "mental type," as this is probably the most important factor in determining the direction of one's mental development. Of mental types the "visual" is, of course, by far the most common, but in my own case visual imagery was never strong or vivid, and has constantly grown weaker. The dominant part has been played by tactual, muscular and organic sensations, placing me as one of the "tactual motor" type, with strong "verbal motor" and "organic" tendencies. In reading a novel I seldom have a mental picture of the character or situation, but easily imagine the sensations (except the visual) and feel something of the emotions described. When telling of any event I have a strong impulse to make the movements described and to gesticulate. I remember events in terms of movements and the words to be used in giving an account of them; and in thinking of any subject I can feel the movements of the larynx and, in a less degree, of the lips and tongue that would be involved in putting my thoughts into words. I am easily moved to emotion, even to sentimentality, but am seldom if ever deeply affected and am so averse to any display of my feelings that I have the reputation among my acquaintances of being cold, unfeeling and unemotional. I am naturally quiet and bashful to a degree, which has rendered all forms of social intercourse painful through much of my life, and this in spite of a real longing to associate with people on terms of intimacy. As a child I was sensitive and solitary; later I became morbid as well. In a character so constituted the feelings and impulses of the moment are likely to rule, and such has been my constant experience, though a large element of obstinacy in my character has kept me from appearing impulsive, and slight influences will bring about reactions which seem out of all proportion to their cause. For instance, I cannot, even now, read the more erotic of Boccaccio's stories without a good deal of sexual excitement and restlessness, which can be relieved only by vigorous exercise or masturbation.

The first ten years of my life were passed on a farm, most of the time without playmates or companions of my own age.

As far back as I can remember I indulged in elaborate day-dreams in which I figured as the chief character along with a few others who were chiefly creatures of my imagination, but at times borrowed from reality. These others were always boys until I learned the proper function of the sexual organs, when girls usurped the whole stage in numbers beyond the limits of a Turkish harem. Even at school my day-dreams were scarcely interrupted, for my shyness and timidity made me very unpopular among my schoolmates, who tormented me after the fashion of small boys or neglected me, as the spirit moved them. To make matters worse, I was brought up under the "sheltered life system," kept carefully away from the "bad boys," which category included nearly all the youngsters of the community, and deluged with moral homilies and tirades on things religious until I was thoroughly convinced that goodness and discomfort, the right and the unpleasant, were strictly synonymous; and I was kept through much of the time facing the prospect of an early death, to be followed by the good old orthodox hell or the equal miseries of its gorgeous alternative. I may say in all seriousness that this is a conservative and unexaggerated account of one phase of my early life--the one, I think, that tended most strongly to make me introspective and morbid. Later on, when I was trying to abandon the habit of masturbation, this early training greatly increased the despair I felt at each successive failure.

The first traces of sexual excitement that I can now recall occurred when I was about 4 years old. I had erections quite frequently and found a mild pleasure in fondling my genitals when these occurred, especially just after waking in the morning. I had no notion of an orgasm, and never succeeded in producing one until I was 13 years of age. In the summer of my sixth year I experienced pleasurable sensations in daubing my genitals with oil and then fondling or rubbing them, but I abandoned this amusement after getting some irritating substance into the meatus. A year later my mother warned me that playing with my penis would "make me very sick," but since experience had taught me that this was not true, my conviction that what was forbidden must necessarily be pleasant, sent me directly to my favorite

retreat in the barn loft to experiment. Since, however, I failed, in spite of persistent effort, to produce any such pleasant results as I had expected, I soon gave up my attempts for other kinds of amusement.

A few months after this, in midsummer, a very sensual servant girl began a series of attempts to satisfy herself sexually with my help. She came nearly every day into the loft where I was playing and did her best to initiate me into the mysteries of sexual relationships, but I proved a sorry pupil. She would rub my penis until it became erect and then, placing me upon her, would insert the penis in her vulva and make movements of her thighs and hips calculated to cause friction. At times she varied the program by lying upon me and embracing me passionately. I can remember distinctly her quick, gasping breath and convulsive movements. She generally ended the seance by persuading me to perform cunnilingus upon her. None of these performances were intelligible to me and I invariably protested against being compelled to leave my play to amuse her. Even her fondling of my genitals annoyed me; and, stranger still, I preferred satisfying her by cunnilingus to the attempts at coitus.

It was nearly a year later that I experienced the first unmistakable manifestations of the sexual impulse--erectations accompanied by lustful feeling and vague desires of whose proper satisfaction I had no notion whatever. It never occurred to me to associate my experiences with the servant girl with these new sensations. The peculiar fact about them was that they were generally occasioned by the infliction of pain upon animals. I do not remember how I first discovered that they could be evoked in this way, but I can clearly recollect many of my efforts to arouse this pleasurable excitement by abusing the dog or the cats, or by prodding the calves with a nail set in the end of a broom handle. I seldom manipulated my genitals at this time, and when I did it was for the purpose of causing sexual excitement rather than allaying it.

During this same year I got my first idea of sexual intercourse by watching animals copulate; but my powers of observation must have been limited, for I supposed that the penis of the male entered the anus of the female. In watching the coitus of animals I experienced lively sexual excitement and lustful sensations,

located not only in the genitals, but apparently in the anus as well. I often excited, myself by imagining myself playing the part of the female animal--a peculiar combination of passive pederasty and bestiality. A servant girl put me to right on the error of observation just mentioned, but neglected to apply the principle to human animals, and I remained for another year in complete ignorance of the structure of woman's sexual organs and of the intercourse between man and woman. In the meantime I cultivated my fancies of intercourse with animals, often still perversely imagining myself taking the part of the female; and the notion of such relationships gradually became so familiar as to seem possible and desirable. This is especially significant in view of later developments.

Up to my eleventh or twelfth year the erotic element in my daydreaming varied with the seasons. In the summer it played a dominant part, while in the winter it was almost entirely absent, owing, it may be, to the fact that most of my time was spent indoors or on long, tiresome tramps to and from school, and the further fact that during the winter I saw but little of the animals which had acted as a stimulus to sexual excitement. So little was I troubled in winter and so ignorant was I of normal intercourse that sleeping with a cousin, a girl of about my own age (7 or 8 years), resulted in no addition to my knowledge of things sexual.

It was early in my ninth year that I first learned something of the anatomical difference between man and woman and of the functions of the sexual organs in coitus. These were explained to me by a young male servant, who, however, told me nothing of conception or pregnancy. At first I was very little interested, as it did not immediately occur to me to associate my own erotic experiences with the matter of these revelations; but under the faithful tuition of my new instructor I soon began to desire normal coitus, and my interest in the sexual affairs of animals weakened accordingly. His teachings went still further, for he masturbated before me, then persuaded me to masturbate him, and finally practiced coitus inter femora upon me. He also tried to masturbate me, but was unable to produce an orgasm, though I found the experiment mildly pleasurable.

Early in my eleventh year we left the farm and lived in the city

for several months. In the meantime there had been no developments in my sexual life beyond what has already been indicated. In the city I found so much to interest and amuse me that I almost entirely forgot my erotic day-dreams and desires. Though my chief playmates were two girls of about my own age I never thought of attempting sexual intercourse with them, as I might easily have done, for they were much wiser and more experienced in these things than myself. Shortly before the end of our stay in town an older schoolmate explained to me as much of the process of reproduction as is usually known by a precocious youngster of 12 years, but I firmly refused to credit his statements. He adduced the fact of lactation in proof of the correctness of his views, but I had been too thoroughly steeped in supernaturalism to be very amenable to naturalistic evidence of this sort and remained obdurate. But the suggestion stayed with me and perplexed me not a little; when we returned to the farm I began to watch the reproductive process in animals.

The following two years were decidedly unpleasant. I was growing rapidly and was sluggish, awkward and stupid. At school I was more unpopular than ever and seemed to have a positive genius for doing the wrong thing. On the rare occasions when my companions admitted me to their counsels I was a willing dupe and catspaw, with the result that I was much in trouble with my teachers. Being morbidly sensitive I suffered keenly under these circumstances and, as my health was not at all good, I often made of my frequent headaches excuses to stay at home, where I would lie abed brooding over my small troubles or, more often, dreaming erotic day-dreams and making repeated attempts to produce an orgasm. But though these efforts were accompanied by the most lustful thoughts and my imagination created situations of oriental extravagance, I was 13 years old when they first met with success. I remember the occasion very distinctly, the more so because I thought of it much and bitterly when shortly afterwards I tried to abandon a habit which the family "doctor book" assured me must result in every variety of damnation. At the moment, however, I was greatly surprised and gratified and tried at once to repeat the delightful sensation, but was unable to do so until the following day. From that time to the present I think I have masturbated an average of ten times per week, and this is certainly a very conservative estimate; for though up to my sixteenth year I could seldom produce an orgasm more than once

a day I have often, during the last four or five years, produced it from four to seven times per day without difficulty and this for days and even weeks in succession. During these periods of excessive masturbation very little liquid was ejaculated and the pleasurable sensations were slight or entirely lacking.

From the time when I began masturbating regularly practically my whole interest centered in things pertaining to sex. I read the chapters of the family "doctor book" which treated of sexual matters; my day-dreams were almost exclusively erotic; I sought opportunities to talk about sex-relationships with my schoolmates, with whom I was now slowly getting on better terms; I collected pictures of nude women, learned a great number of obscene stories, read such obscene books as I could obtain and even searched the dictionary for words having a sexual connotation. Up to my fifteenth year, when ejaculation of semen began, there was a strong sadistic coloring to my day-dreams. Through this period, too, my bashfulness in the presence of the opposite sex increased until it reached the point of absurdity.

When fifteen years old I began to practice coitus inter femora on my brother and continued it intermittently for about two years. The experience was disappointing, for I had confidently expected a great increase of pleasure over masturbation in this act; and in casting about for some stronger stimulus I recurred to the forgotten idea of intercourse with animals. I promptly tried to put the idea to a test, but failed several times, and finally succeeded, only to find that the result fell far short of my expectations. Nevertheless I continued the practice irregularly for about three years--or rather through that part of the three years that I spent at home, for while I was at school opportunity for such indulgence was lacking. Long familiarity with the idea of intercourse with animals had made it impossible for me to feel the disgust with the practice which it inspires in most people; and even the perusal of Exodus xxii: 19 failed to make me abandon it. Firmly as I believed in the Mosaic law the supremacy of the sexual impulse was complete.

As early as my sixteenth year I tried to abandon "self-abuse" in all its forms and have repeatedly made the same effort since that time but never with more than very partial success. On two or three occasions I have stopped for periods of several weeks, but

only to begin again and indulge more recklessly than before. The deep depression which followed each failure, and often each act of masturbation, I attributed solely to the loss of semen, leaving out of account the fact that I expected to feel depressed and the utter discouragement and self-contempt which accompanied the sense of failure and weakness when, in the face of my resolution, I repeatedly gave way and yielded to the temptation to an act whose consequences I firmly believed must be ruinous. I am now convinced that by far the greater part of this depression was due to suggestion and the humiliating sense of defeat. And this feeling of moral impotence, this seeming helplessness against an overpowering impulse which, on the other hand, seemed so trivial when viewed without passion, eventually weakened my self-control to a degree guessed by no one but myself and sapped the foundations of my moral life in a way which I have constant occasion to deplore.

The foregoing paragraphs give, I think, a fair idea of my condition when I left home for a boarding school at the beginning of my seventeenth year. From this time my experiences may be said to have run on in two distinct cycles--that of the summer months when I was at home, and that of the remainder of the year when I was at school. This fact will make some confusion and apparent inconsistency in the rest of this "history" unavoidable. When I left home I was shy, retiring, totally ignorant of social usage, without self-confidence, unambitious, dreamy, and subject to fits of melancholy. I masturbated at least once a day, though I was in almost constant rebellion against the habit. In my more idle moments I elaborated erotic day dreams in which there was a peculiar mixture of the purely sensual and the purely ideal element; which never fused in my experience, but held the field alternately or mingled somewhat in the manner of air and water. One person usually served as the object of my ideal attachment, another as the center round which I grouped my sensual dreams and desires.

At school I found more congenial companions than I had fallen in with elsewhere, and the necessary contact with people of both sexes gradually wore off some of the rougher corners and brought a measure of self-confidence. I had two or three incipient love affairs which my backwardness kept from growing serious. Out of this change of environment came a sense of expansion, of escape

from self, which was distinctly pleasant. I still masturbated regularly, but no longer experienced the former depression except when at home during vacation. Relatively to the past, life was now so varied and interesting that I had less and less time for melancholy; and the discovery that I could lead my classes and hold my own in athletic sports seemed to indicate that my past fears had been exaggerated. Nevertheless I was never reconciled to the habit and often rebelled at the weakness that kept me its slave.

When I entered the university the effects of my useless struggle with the practice of masturbation were pretty well developed. I could no longer fix my attention steadily upon my work and found that only by "cribbing" and "bluffing" could I keep my place at the head of my classes. I was troubled not a little by the shoddiness of my work, and tried again and again during the course of the two years spent at this college to shake off the habit. At the university I was introduced gradually to a wider social circle and so far outgrew my bashfulness that I began to seek the society of the opposite sex assiduously. As I gained self-confidence I became reckless, getting at one time into serious trouble with the authorities which came near resulting in my expulsion. I became one of the more popular members of the clique to which I belonged--much to my surprise and even more to that of my acquaintances. The physical culture craze attacked me at this time and my pet ambition was the attainment of strength and agility. My bump of vanity also grew apace, but an unmeasured hatred of all kinds of foppishness kept me on the safe side of moderation in my dress and behavior.

During my second year of university life I had two love affairs in the course of which I found that my interest in any particular member of the fair sex disappeared as soon as it was returned. The pursuit was fascinating enough, but I cared nothing at all for the prize when once it was within reach. I may add that the interest I had in the girls was purely ideal. While at this school I do not think I masturbated half as often as while at the preparatory school.

When I left this college for ---- University I took with me a formidable catalogue of good resolutions, first among which was the determination to abandon all kinds of "self-abuse." I think I

kept this one about a month. As I had gone from a comparatively small school to one of the largest of American universities the change was great and the revelations it brought me frequently humiliating. I was lonesome, home-sick, and my bump of self-esteem was woefully bruised; and not unnaturally I soon began to seek a partial solace in day-dreams and masturbation. After I had become somewhat adapted to my new environment I indulged less frequently in either, and from that time to the present I have masturbated very irregularly, sometimes but little and again to excess.

Not long after I came to this place I met a young lady with whom I soon became quite intimate. For over a year our friendship was strictly platonic and then swung suddenly around to a sexual basis. We were ardent lovers for a few weeks, after which I tired of the game as I had before in other cases, and broke off all relations with her as abruptly as was possible. Since then I have almost wholly withdrawn from the society and companionship of women and have almost entirely lost whatever tact and assurance I once possessed in their company. Things pertaining to sexual life have interested me rather more than less, but have occupied my attention much less exclusively than before this episode. Though I have never intended to marry, my breaking off relations with this girl affected me much. At any rate it marked an abrupt change in the character of my sexual experiences. The sexual impulse seems to have lost its power to rouse me to action. Hitherto I had practiced masturbation always under protest, as it were--as the only available form of sexual satisfaction; while now I resigned myself to it as all that there was to hope for in that field. Of course I knew that a little effort or a little money would procure natural satisfaction of my sexual needs, but I also knew that I would never, under any ordinary circumstances, put forth the necessary effort, and fear of venereal disease has been more than enough to keep me away from houses of prostitution.

Some months ago I refrained from masturbation for a period of about six weeks and watched carefully for any change in my health or spirits, but noticed none at all. The only impulse to masturbate was occasioned by fits of restlessness accompanied by erections and a mildly pleasurable feeling of fullness in the penis and scrotum. I think that over 75 per cent, of my acts of

masturbation are provoked by these fits of restlessness and are unaccompanied by fancy images, erotic thoughts, lustful desires, or marked pleasure. At other times the act is occasioned by erotic thoughts and images, and is accompanied by a considerable degree of lustful pleasure which, however, is never so intense as in my earlier experiences and has steadily decreased from the first. Usually the orgasm is accompanied by a strong contraction of all the voluntary muscles, particularly the extensors, followed by a slight giddiness and slight feeling of exhaustion. If repeated several times in the course of a single day the acts are followed by dullness and lassitude; otherwise the feeling of exhaustion passes away quickly and a sense of relief and quiet takes its place. So natural or rather habitual has this resort to masturbation as a means of relief from nervousness and restlessness become that the act is almost instinctive in its unconsciousness.

I am extremely sensitive to all kinds of sexual influences, and have an insatiable curiosity regarding everything that pertains to the sexual life of men or women. I am not, however, excited sexually by conversation about sexual facts and relationships, no matter what its nature, though in reading erotic literature my excitement is often intense.

The tendency to day dream has never left me, but there are no longer any elaborate scenes or long-continued "stories," these having been replaced by vaguely imagined incidents which are usually broken off before they reach a satisfactory climax. They are always interrupted by the intrusion of other matters, usually of more practical interest; and the long-continued habit of satisfying myself by masturbation has made erotic dreams rather tantalizing than pleasurable. I dream very seldom at night--at least I can scarcely ever remember any dreams upon waking--and practically never of sexual relations. I have not had a nocturnal emission for over three years, and probably not more than twenty-five in my life.

In my "love passages" with girls there has been no serious thought of coitus on my part, and I have never had intercourse with a woman--unless my early experiences with the servant girl be called such. Like all masturbators I always idealized "love" to the utter exclusion of all sensual cravings; and the notion

that the physical act of coitus was something degrading and destructive of real love rather than its consummation was, of all prejudices I have ever formed, the most difficult to escape--a circumstance due, I suppose, to the fact that all I had ever been taught on the subject tended to the complete divorce of what was called "love" from what was stigmatized as a "base sensual desire." Judging from my own experience and observation I should say that "ideal love" is a mere surface feeling, bound to disappear as soon as it has gained its object by arousing a reciprocal interest on the part of the one to whom it is directed. So little did I "materialize" the objects of my "love" that I have never cared for kissing or the warm embraces in which lovers usually indulge. I have never kissed but one girl, and her with far too little enthusiasm to satisfy her. My last sweetheart was a very passionate girl, the warmth of whose embraces was somewhat torrid and, to me, both puzzling and annoying. The intensity of feeling which demanded such strenuous expression was beyond my knowledge of human nature. A somewhat peculiar circumstance in connection with these experiences is the fact that I often found myself trying to analyze my emotions with a purely psychological interest while playing the part of the intoxicated lover in his mistress's arms.

There is but little left to say on the subject of my sexual development. During the last two or three years my knowledge of the facts of the sexual life has been very greatly increased, and I have become acquainted with phases of human nature which were wholly unknown to me before. The part played by things sexual in my life is still, I suppose, abnormally large; it is undoubtedly the largest single interest, though my outer life is determined almost wholly by other considerations.

Of course I know nothing of the effect which long-continued masturbation may have had on my ability to perform normal coitus. I do not think I am subject to any kind of sexual perversion, for all my indulgence has been *_faute de mieux_* and, at least since I began masturbation, all my desires and erotic day-dreams have had to do only with normal coitus. The mystery which surrounds the sexual act seems at times to be regaining its former influence and power of fascination. I have no doubt, however, but that I should be greatly disillusioned should I ever perform coitus; and I greatly regret that I have not been able to test this

conviction and so round out and complete this "history."

It may be worth while to say a word about my religious experiences, as, in many cases, they are closely bound up with the sexual impulse. I was never "converted," but on a dozen or more occasions approached the crisis more or less closely. The dominant emotion in these experiences was always fear, sometimes with anger and despair intermixed in varying proportions. A complete analysis of these experiences is, of course, impossible, but the various pleasurable feelings of which converts spoke in the revivals which I attended were a closed book to me. Following my revival-meeting experiences came a few days spent in a sort of moral exaltation during which I eschewed all my habits of which conventional morality disapproved, save masturbation, and felt no small satisfaction with my moral conditions. I became a first-rate Pharisee. Toward the women who had figured in my day dreams I suddenly conceived the chastest affection, resolutely smothering every sensual thought and fancy when thinking of them, and putting in place of these elements ideal love, self-sacrifice, knightly devotion--Sunday-school Garden-of-Eden pictures with a mediaeval, romantic coloring. These day-dreams were always sexual, involving situations of extreme complexity and monumental silliness. Masturbation was always continued and usually with increased frequency. The end of these periods was always abrupt and much like awaking from a dream in which the dreamer has been behaving in a manner to arouse his own disgust. They were followed by feelings of sheepishness and self-contempt mingled with anger and a dislike of all things having to do with religion. My inability to pass the conversion crisis and a growing contempt for empty enthusiasm finally led me to a saner attitude toward religion, from which I passed easily into religious scepticism; and later the study of philosophy and science, and particularly of psychology, banished the last lingering remnant of faith in a supernatural agency and led me to the passion for facts and indifference to values which have caused me to be often called "dead to all morality."

HISTORY II.--C.A., aged 25, unmarried; tutor, preparing to take Holy Orders:--

My paternal ancestry (which is largely Huguenot) is noteworthy

for its patriotism and its large families. My father, who died when I was a year old, is remembered for the singular uprightness and purity of his life from his earliest childhood. The photograph which I have shows him as possessed of a rare classic beauty of features. He was an ideal husband and father. At the time of his death he was a Master of Arts and a school principal. My mother is an extraordinarily neurotic woman, yet famed among her friends for her great domesticity, attachment to her husbands, and an almost abnormal love of babies. She has nobly borne the ill-treatment of her second husband, who for several years has been in a state of melancholia. My mother has been "highly-wrought" all her life, and has suffered intensely from fears of all kinds. As a young girl she was somnambulistic, and once fell down a stairhead during sleep. In spite of her bodily sufferings with indigestion, eye-strain, and depression she retains her youthfulness. She has slight powers of reasoning. She has had times of unconsciousness and rigidity, I have never heard any mention of epilepsy. She has a horror of showing prudishness in regard to the healthful manifestations of sex life, and is always praising examples of what she terms "a natural woman."

I have heard that during my first year my mother detected my nurse in the act of putting a morphine powder on my tongue for the purpose of keeping me quiet. I was subject to convulsions at this period, and narrowly escaped a permanent hernia. My family tell me that from the beginning I was a well-developed and boyish boy, full of mischief, impulsive, good to look upon, unusually affectionate, beloved by all.

In my third year I took pleasure in crawling under the bed with my boy-cousin who was nine months my senior, and after we had taken down our drawers, in kissing each other's nates. I do not remember which of us first thought of this pastime.

At the age of 4 I gave myself a treat by gazing upward through a cellar window at the nates of a woman who was defecating from several feet above into a cesspool that lay beneath. It was during this summer also that I frightened myself by pulling back my prepuce far enough to disclose the purple glans, which I had never seen before. But this act gave me no desire to masturbate.

When 5 years old, and living in a great city, I drew indecent

pictures in company with a little girl and her younger brother. These pictures represented men in the act of urinating. The penes were drawn large, and the streams of urine plainly indicated. One afternoon I induced the boy to go to the bath-room, lie on his back, and allow me to perform _fellatio_ on him. I did not ask him to return the favor. I remember the curious tar-like smell of his clothing and the region about his genitals. It is possible that I gained my knowledge of _fellatio_ from an unknown boy of 10, who had induced me, during the preceding summer to enter a sandy lot with him, watch him urinate, and then, kneeling before him, commit _fellatio_. A year later, as I was walking home in the rain to our summer cottage, with an open umbrella over my shoulder, a boy of 15, who was leaning against our fence, exhibited a large, erect penis, and when I had passed him urinated upon me and my umbrella. I never saw the boy again. I felt peculiarly insulted by his act. Back of the house there lived a 12-year-old boy who invited me to watch him defecate in the outdoor privy, and during the act told me a number of indecent stories and words which I cannot remember.

About this time I fell in love with a little Jewish boy next door. Often I cried myself to sleep over the thought that perhaps he was lying on a sofa alone and crying with a stomach-ache. I longed to embrace him; and yet I saw little of him, and made little of him when I was with him.

Living in a Western city a few months later, some girls of 12 and 14 led me to their barn, where they dressed themselves in boys' clothing and made believe that they were cowboys. One of them told me to "shut my eyes, open my mouth, and get a surprise." When I opened my eyes once more a piece of hen-dung lay in my mouth. I have a vague remembrance of one of the girls asking me to enter a water-closet with her. She uttered some indelicate phrase, but I performed no act with her. In the house where I lived I once entered the bedroom of a half-grown girl while she was dressing. She knelt to kiss me innocently enough, and I, by a sudden impulse, ran my hand between her bare neck and her corset as far as I could reach. Apparently she took no notice of my movement. Although I did not masturbate, yet during this winter I experienced a tickling sensation about my genitals when I placed my hand beneath them as I lay on my stomach in bed. One evening I pulled up my night-dress and, holding my penis in my hand, I

danced to and fro on the carpet. I imagined that I was one of a line of naked men and women who were advancing toward another similar line that faced them. I imagined myself as pleasurable coming in contact with my female partner who possessed male genitals.

The following summer I lived in the woods. My next-door playmate was a little girl of my own age--6 years. She sat down before me in the barn and exposed her genitals. This was the first time I had seen female organs, or had thought for a moment that they differed from my own. In great perplexity I asked the little girl: "Has it been cut off?" She and I defecated in peach baskets that we found in the upper part of the barn.

When I was 7 years old and back in the Eastern city I lived in the house of a physician. Alone with his 3-year-old daughter one day, I showed her my erect organ, and felt a delicious gratification when she stroked it with the words: "Nice! Nice!" I confessed my fault to my guardian that night after I had said my prayers. I had complained to my mother a year before of the inconvenience I found in my penis being "so long sometimes." She said that she would "see about having the end taken off." But I was never circumcised. Her words gave me the doubly unpleasant impression that my glans was to be cut off.

There came occasionally to the kitchen of Dr. W.'s house a foul-mouthed Irish laundress who used coarse language to me concerning urination. I loathed the woman, and yet one night I dreamed that I was embracing her naked form and rolling over and over with her on the bed; and in spite of my sight of female genitals a few months before, I thought of her as having organs of my own kind and size. At my first school I watched a red-haired boy of 12 expose the penis of a 7-year-old boy as he lay on his back in the bath-room. I do not remember that the sight gave me sexual pleasure.

I spent the summer before I was 8 in a double house. The adopted daughter of our neighbor (a neurotic, retired physician) was a girl of 13 who had been taken from a poor laboring family. She got me to show her my parts, touched them, and asked whether I urinated from my scrotum. She also induced me to play with her genitals as we sat on a sofa in the twilight, and to spank her

naked nates with the back of a hair-brush as she lay on a bed; but from none of these performances did I derive physical satisfaction. The girl E. and I took delight in "talking dirty secrets," as she expressed it. Her young cousin H. (nephew of her adopted mother) never heard me use the word "thing" without suggestively smiling. E. recalled the pleasant hours that she had spent with her cousin when they were in their night-gowns. She did not particularize these sexual relations. Under the board-walk the boy H. and I once defecated in bottles. Some little girls who lived opposite us pulled up their dresses one night and "dared" each other to dance out beyond the end of the house, in full view of the road. We boys merely looked on.

I now fell passionately in love with a remarkably handsome little boy of my own age. I longed to kiss and hug him, but I did not dare to do so, for he was haughty and intolerant of my attentions. I even allowed him to stand with one foot on me and remark in a loud tone: "I am Conqueror!" I endured no end of petty insults and much ill-treatment from this boy. I reached the height of my passion on the night that he appeared at our cottage in a tight-fitting suit of pepper-and-salt. I gloried in his perfect legs and besought my guardian that she would buy me a similar suit of clothes.

For the summer after I was 8 years old I lived in a cottage in a country town. The servant maid M. was a young girl of 16 who listened eagerly to my accounts of the "secrets" and actions in which the girl E. and I had taken delight a year before. I think that M. arranged a meeting between a little black-haired girl and me in order that we might take a walk and play sexually with each other. Just as we were starting on our walk one of my relatives said that I must not leave the yard.

The little girl and I had see-sawed together and I had been interested in her legs as she rose in the air. (When I was 13 years old and see-sawing at a picnic with a stout girl, the motion of the board and the sight of her straddled form filled me with longing to embrace her sexually.) One afternoon M. took me to the house of an acquaintance of hers. M's brother was in the room and made a number of unremembered remarks which struck me as being rather "free," and M. told me later that she and the girl once dressed as ballet dancers and danced before M.'s brother. I

felt that he was lascivious. I was always remarkably intuitive.

I fell in love with a handsome, stout, black-haired boy who lived on a farm; but he was not a "farmer's son" in the common sense of the word. I visited him for two or three days, and we slept with each other, to my boundless joy. For his freckled girl cousin I did not care the turn of my wrist, although she was a nice enough little thing. One night when we three lay on a bed in the dark, and neither of us boys had eyes or words for her, she silently left us. He and I never committed the slightest sexual fault. I left him with tears at the summer-end, and I often kissed his photograph during the following winter.

In the flat-house where I began to live when I was 8 years old, I once practiced mutual tickling of a very slight character with a boy of my own age. We sat on chairs placed opposite to each other and we inserted our fingers through the openings in our trousers. Just as we were beginning to enjoy the titillation we were interrupted by the approach of one of my family who, however, was not quick enough to discover us. Down cellar I often saw the genitals of the janitor's little girls--they were fond of lifting their skirts and they did not wear drawers--but I had no desire to attempt conjunction. I once caught an older friend of mine (he was 13) in the act of leaving one of the girls. The pair had been in a coal-compartment. The boy was buttoning his trousers and I guessed what he had been doing. When I began to sleep alone in my tenth year I had no desire to masturbate, and was loath to do so by reason of ample warnings given me by my guardian and by the family physician. One afternoon a stunted friend of mine sat down in the back yard and astonished me by tying a piece of string to his penis. At a large private school which I now attended I made the acquaintance of the principal's son, and wondered why he had such a fancy for dressing his 5-year-old sister in boy's clothes. He closed the door on me while he was thus engaged. At my house we went to the bath-room together, and he showed me his circumcised and much-ridged penis. Neither of us made any mention of masturbating.

At this period I fell slightly in love with a 5-year-old boy with intensely black eyes. I would kiss him whenever we were alone, but I had no wish to seduce him. I was always interested in watching the urination of younger children. When I was 5 years

old I went on my knees to a strange little boy in order to whisper in his ear an inquiry as to whether he wanted to urinate. I experienced a pleasurable thrill when I was 10 years old in leading a small girl cousin to the outdoor privy, in helping her on and off the open seat, in buttoning and unbuttoning her drawers, and in gazing at her vulva.

The summer before I was 10 I lived a wild life in the mountains. My companions were a negro girl, the two daughters of a clergyman, the two sons of a questionable woman hotel-keeper, and the daughter of the Irish scavenger. All of these children were extraordinarily sensual. Their leading pastime, from morning until night, was varying forms of indecency, with the supreme caress--which they termed "raising dickie"--as the most frequent enjoyment. The 5-year-old daughter of the scavenger explained to us how she had seen her father approaching her stout mother with an erect penis, the pair standing up before the lamplight during the act. This curly-headed, rosy-cheeked child handled her genitals so much that they were inflamed. I once saw her sitting in the road and rubbing dust against her vulva. I saw little of the elder daughter of the minister (she was 12 years old). She persuaded me to expose myself before her in the cellar of a partially-built house. In return for my favor she allowed me to look at her genitals. She did not ask for _conjunctio_. The two younger daughters were my intimates. With the middle one I was forever performing a weak conjunction that consisted in the laying of my member against her vulva. Notwithstanding all the entreaties of my little friend, I could not be persuaded to protrude my penis against her vagina; and not on one occasion can I remember obtaining an erection or extreme pleasure. Up in the garret she straddled slanting beams with her genitals exposed, and I followed her example. The negro girl and my little friend both urinated on a tent floor at my request. I did not fancy the odor of a girl's genitals, nor the appearance of the vulva when the labia were held apart.

The following summer, when I was almost 11, I took a long walk one day with my old friend, the girl E. We entered a patch of woods and ate our lunch, but no sense of sexual drawing toward the girl came over me and she did not offer to entice me. I slept with her boy-cousin one night, and her neuropathic aunt, a retired lady physician, bothered us by repeatedly creeping into

our room. I felt intuitively that she was watching to see whether we would commit mutual masturbation--which we had no thought of doing. Three years before I had opened the door of her bedroom suddenly and saw E.'s naked form. The physician had been examining her, E. told me later. My guardian also annoyed me by repeated warnings not to play with myself.

Just before I turned 11 I was sent to a small and so-called "home" boarding-school. Eight of us lived in the smaller dormitory. The matron roomed downstairs. There was no resident master--a serious error. We small boys were told to strip one evening. We were then tied neck-to-neck and made to dance a "slave-dance," which was marked by no sexuality. A boy of 15, R., one afternoon gave me the astonishing information that my father had taken a part in my procreation. Up to this moment I had known only of the maternal offices, information of which had been beautifully supplied to me by my guardian when I was 7 years old. At that time I talked freely about the coming of a baby brother in a distant city; I watched the construction of baby clothes; I named the newcomer, and I was momentarily disappointed when he proved to be a girl. This same R., a strong boy with a large penis, got into the custom of lying in bed with me just before lights were put out. He would read to himself and occasionally pause to pump his penis and make with his lips the sound of a laboring locomotive. I felt impelled to handle his organ, for I was fascinated by its size, and stiffness, and warmth. Rarely he would titillate my then small and unerect penis. R. never ejaculated when he was with me; hence not until my third year was I acquainted with the appearance of a flow of semen. Sometimes R. would stop during his dressing to manipulate his penis, but was such a picture of rosy health that I doubt whether he brought himself often to ejaculation. R. told me that he had been to a brothel where his genitals were examined to determine whether they were large enough and not diseased. He also related how he "played cow" with a girl of his own age, she consenting to perform fellatio upon him. A dark-skinned, unwashed, pimpled but fairly vigorous boy of 16, with an irritable domineering manner, told me the delights of coitus with a girl in a bath-house, and I overheard his conversation with another "old" boy concerning the purchase of a girl in a big city for the sum of five dollars. No details were given.

I will now pass to my third year, when I was 13 years old. A large, well-set-up boy of 16, A., became my idol. His toleration of my presence in his room filled me with endless love. When I lied about a matter in which he was concerned, his denunciation of me brought me to a state of shuddering and weeping unspeakable. When our relations were established again A. allowed me to creep into his bed after the lights were out, and there I passionately embraced him, but without performing any definite act. When I turned over on my side with my back to him he drew my prepuce back and forth until I experienced orgasm, but not ejaculation. I would return his favor by pumping his erect penis, but with no ejaculation on his part. He did not propose _fellatio_, and I did not think of it. One night when he was in my bed I began to masturbate very slightly, whereupon he laughed, saying: "So that is the way you amuse yourself!" As a matter of fact the habit was not fastened upon me. He always laughed when the rubbing of his finger on my exposed glans caused me to shrink. Another boy, H., now began to show me his erect penis and we practiced mutual manipulations. A. laughingly told me how he had caught H. in the act of masturbating as he stood in the bath-tub. A. told me a number of sexual stories--how he enjoyed coitus in the bushes with a girl on the way home from entertainments; how half a dozen boys and girls stripped in the basement of a church and performed coitus on the velvet chairs which stood behind the pulpit; and how he and a younger boy, who camped out together, played with each other's genitals. F., a boy of 11, was highly nervous, subject to timidity and tears on the slightest provocation, often morose, and under treatment for kidney trouble. His penis was erect whenever I saw him undress. He told me that a partially idiotic man taught F. and his companion how to masturbate. The man invited the boys to his tent and there pumped his organ until "some white stuff came out of it." F. also told me that an Indian princess in his part of the country would permit coitus for fifty cents. A. sometimes slept with F., and I could imagine their embraces. S., a secretive, handsome boy of 13, wetted his bed with urine every night. The only sign that he gave of an interest in sexuality was his laughing remark concerning the coupling of rose-bugs. Of his chum, my beloved C., I will speak later. My small room-mate handled himself only slightly. I never had a desire to lie with him, since I disliked him, nor with my first room-mate, a "chunky," fiery boy of 10, whose penis interested me merely

because it was circumcised and almost always erect. His masturbation was also so slight as not to attract any particular attention. A lusty German boy, B., showed no signs of sexuality until his third year, when he laughed about his newly-appearing pubic hair, and told several of us openly of how he enjoyed to play "a drum-beat" on his penis before going to sleep. "I don't do it too much, though," he explained. He showed a mild curiosity when I gave him the resume of a book on cohabitation which contained illustrations of the erect penis and the female organs. I had found this book in the woods and I read it eagerly during my third year.

I came to the point of agreeing with A., who said: "Everyone is smutty." Indeed I lived in a lustful world, and yet my mind was bent also on books, and writing, and the outdoor world. I was overgrown and splendidly developed, with a medium-sized penis and a scant growth of pubic hair. My face wore a somewhat infantile expression. My mouth was a perfect "Cupid's bow," my hair thin and light. I was troubled about my snub-nose, which gave the boys a great deal of amusement. As a matter of fact I exaggerated its upward tendency out of my morbid self-consciousness and cowardice. My imagination was extraordinarily intense, as it had always been. I was sensitive to smells and sounds and colors and personalities, and to the subtle influence of the night. I was timid and easily moved to tears, but not from any physical weakness until after. At the lower house there was the boy Z., famed for his large penis; and the older G., a boy of 15, who was the leader in sexuality at his dormitory. Z. showed me his penis and exposed his glans often enough, but we did not manipulate each other. G. told us to notice how large a space his penis occupied in his trousers, and laughed over Z.'s custom of masturbating by means of a narrow vase. G.'s special lover was a nervous boy of ten. It is remarkable that none of us mentioned _fellatio_ or _paedicatio_. These acts may have occurred at school, but not to my knowledge. We did not have much to say sexually about the girls. We heard rumors of a 16-year-old, V., who had been sent away from school for coitus; and my first room-mate was said to have obtained _conjunctio_ with a girl under cover of the chapel shed. Once A. and I pointed a telescope at the open windows of the girls' dormitory, but we saw nothing to interest us. A day-scholar, J., a pale, nervous, bright boy of 13, took me into the study of his uncle-physician and together we

gloated over pictures of the sexual organs. A. was with us on one occasion. J. told me how he liked to roll over and over in bed with his hand placed under his scrotum. This act, he said, made him imagine that he was obtaining coitus. He advised me to slide my penis back and forth in the vagina whenever I should actually obtain coitus. In my room at school J. once drew an imaginary map of a bagnio, in which the water-closet was carefully displayed _en suite_ with the bedrooms. J. and I never masturbated together. Indeed, I cannot remember seeing his organ. A hulking boy of 16, who lived opposite the school-grounds, became intimate with J., and we three went on a walk up the railroad track. The big boy, W., tried to inflame my passions by telling me how he and J. had had coitus with a handsome black-haired widow in town, but I remained cold.

During this year I fell in love with C., a popular, talkative, witty boy of my own age, or perhaps a year younger. He fancied me and we slept together one night under the most innocent circumstances. I never dreamed of having sexual relations with him, and yet I fairly burned with love for him. My stay at his beautiful home over Sunday while his parents were away was one long delight. We slept in each other's arms, but there was no sexuality. En route to C.'s home he pointed with a glove to a little working-girl, saying he would like to have intercourse with her, but this was the only remark of the kind that ever passed his lips in my presence. When undressed save for his undershirt, he laughingly held his unerect organ in his hand and made the motions of obtaining conjunction with an imaginary partner. Once we spoke of masturbation (I could recite the information of my good physician with a marvelous show of virtue), and C. remarked: "Yes, doing that makes boys crazy." C. finally grew tired of my deceptive, babyish nature and ultra-interest in books and puzzles, but I cherished an undiminished affection for him, and when he was detained at home for a fortnight with a broken arm, I wrote him a passionate letter, which I sobbed over and actually wetted with my tears. But the fervor of my passion died at the close of the year. I consider this unsullied friendship to be the only redeeming feature of my sensual days at school.

Versed as I was in the warnings against masturbation, I found pleasure one afternoon when I was alone in slipping my penis

through the open handle of a pair of scissors and in violently flapping my partially erect organ until a strange, sweet thrill crept over me from top to toe and a drop of clear liquid oozed from my member. But I gave up the manipulation with scissors, finding a greater satisfaction in masturbating while I was defecating or just after it. I either pumped my organ by slipping the prepuce back and forth, or I grasped the organ at its root and violently jerked it back and forth. I soon began to masturbate not only every time that I defecated, but also at night just before I went to sleep, and sometimes early in the morning. On the whole I preferred the jerking just described. I always brought about ejaculation after perhaps five minutes of violent exertion.

My penis became chafed at the root, but I did not especially care. I remember the afternoon that I masturbated for the first time while I was defecating in the school water-closet. I cannot recall that at first I thought of coitus while I masturbated. On one occasion I masturbated over the vase de nuit after a delightful afternoon of tobogganing exploration up and down the mountain.

During this first year of abuse, I felt no ill effects whatsoever, although I realized, in an unthinking way, that I was doing wrong. But sexuality had assumed the proportion of a regular feature of our school life. It was difficult for me to place a "universal" view in its true perspective. I used to smile at the glazed, dull morning eye of poor H., who was a stunted boy of 15, and thus could not endure his losses so well as I could endure them. The qualms of conscience which I suffered were lost in my delight in my dawning sexual life. Sometimes I lay on my stomach in bed, and by placing my hand under my scrotum, according to the directions of J., brought up a pretty girl to mind. Just before Sunday school G., our chief reprobate, and the rest of us would hunt out what we considered to be nasty texts of Scripture. The chapter concerning the whoredoms of Aholah and Aholibah gave me an especial pleasure. T. mentioned the giggling that occurred at prayers in the lower dormitory when the details of Esau's birth were read out. A few days before G. was expelled--for exactly what cause I do not know--he told me of how greatly he enjoyed coitus on his grandmother's sofa with a girl of fifteen. When I went home on the boat for holidays I noted the

large, black-haired penis of the strong boy of our school. He occupied a state-room with me, but made no sexual overtures.

Since my twelfth year I had been wrapped up all summer long in a boy who was six months my senior. We slept together constantly, but not once did we think of obtaining mutual gratification. On the contrary, we held up high ideals to each other and frowned on masturbation. I took delight in saying that I never had handled myself, and never would do so. Even at the height of my "auto-erotic" period, I skillfully concealed my habits from all my boy friends. A neurotic solo choir boy friend once spoke of obtaining ejaculation, whereupon I expressed utter ignorance of such an act, little hypocrite that I was. This boy told how the house servants joked with him about coitus and made laughing lunges at his organs.

But much as I loved my chum, my most passionate regard went out in my thirteenth year to N., a chubby, blue-eyed, choir-boy of 12. He was a pretty boy to any eye. He was not gifted, except in water-sports, and anything but popular either with girls or with boys; yet I grew warm at the mention of his name. He did not care a fig for me. From first to last I had no consciousness of the sexual nature of my passion, and the thought of doing more than embrace and kiss him in an innocent manner never crossed my mind. For two summers I had nights of tossing on my bed (although I almost never was sleepless for any cause) when I would see his dear face and form, in and out of the swimming pool, or engaged perhaps in singing or in showing his beautiful teeth. I seldom was smitten with little girls, and I found myself embarrassed in their company after my ninth year; yet I thought well enough of their looks and ways to enjoy their company at dances. The girls liked me in a platonic way, for I was accounted a good, big, kind, blundering boy with a helping hand for the smallest fry.

During the summer after I was 13, I imagined myself in the early morning, when I was half awake, as persuading my wife to have coitus with me. In the course of my spoken words I kept my hand under my scrotum.

A plump girl-cousin of my own age was visiting at my uncle's during the summer after I was 13. With her I greatly desired to satisfy myself, but I could not be sure that my boy cousin (5

years old) might not find us out, even though she should consent. Once when we three were in the hay-loft a wave of lust rolled over me, but I made no proposal. Night and gaslight greatly increased my libido. On one occasion my aunt had gone to the village for ice-cream, and L. and I were left alone in the dining-room. I took her on my lap and had a powerful erection. I almost asked her to play sexually with me in the barn, but instead I spoke of an imaginary girl, the first letters of whose successive names spelled an indecent word for coitus--a word known to almost every Anglo-Saxon child, I fear. L. laughed, but gave no sign of assent. For a neighboring girl of 15 I felt such a drawing that early in the morning I would roll on the floor with my erect organ in my hand in riotous imagining of coitus with her. I walked with her in the woods and sat at her feet, but although I felt instinctively that she would satisfy me without much persuasion, yet I could not ask her. One night I started to church in order to walk home with her, and lead her (if possible) to a field where we might gratify ourselves (I picked out the exact grassy spot where we might lie); but when I was almost at the church door my "moral sense" (if that is what it was) rose and dragged me home again.

During the swimming hour I watched the genitals of the boys, comparing them carefully in the most minute details. Circumcised organs affected me as being disagreeable, and men's hairy, coarse genitals I abhorred.

When 13 I became acquainted with the new mail-boy at the inn. He was a city "street-boy," and got me into smoking cigarettes occasionally. I did not definitely take up smoking until I was 16. He told me that a mason once offered him ten cents if he would masturbate the man in a cellar. The boy said that he refused. I slept a few times with an ill-favored boy of fine parentage. He was of my own age, and I had played with him in a natural way for several years, but my increasing sexual desires led me to mutually masturbate with him, and even unsuccessfully to attempt with him mutual paedicatio. On the morning after our nights of sensuality I felt "gone" and miserable, but not repentant. By afternoon I was myself again. My relations with G. were purely animal, for I disliked his jealous disposition, his horse-laugh, his features, his form, his withdrawn scrotum and his undersized penis. At home in the evening I often found myself

inflamed with a mental picture of active _fellatio_ with him, but I never performed this act, so far as I remember.

One of my great sexual desires was to walk along a fence on which a girl was seated. In order that I might feast my eyes on her pudenda she must not wear drawers.

When I turned 14 I had been, from my unusual size, in long trousers for several months. I entered a private day-school and progressed brilliantly in my studies. I kept up masturbation almost daily, sometimes twice a day, both in the water closet and in bed. I can remember ejaculating before urination in the school _cabinet_. At night I often found myself longing for the return of my sister, seven years my junior, in order that I might embrace her in bed and fondle her genitals. I had done these things during my Christmas vacation of the year before. I mildly reproached myself for such incestuous desires, but they recurred continually. I dreamed little. And I cannot remember the character of my dreams. My waking _libido_ spent itself mostly in longings to embrace (without lustful acts) the forms of little boys of exquisite blonde beauty and thick hair. Narcissism may have been present, for in my twelfth year I had been told that at the age of 5 and 6 I was an extraordinarily beautiful little creature with long, lint-white hair. The preferable age was from 6 to 9. My eye was alert on the streets for boys answering to this description, and a street boy with long, white hair so won my passion that I followed him to his home and asked his mother if he might call on me and "play some games." As I did not even know the boy's name and had never seen him before, I was wonderingly refused. I sought in vain to find the whereabouts of another long-haired street boy whom I burned to embrace and load with benefits. I had a boundless desire for such a boy as this to idolize me--to look into my face out of big eyes and lose himself in love for me--to call me by endearing pet names--of his own accord to throw his arms around my neck. This second actual boy disappeared from my horizon by presumably moving away from the vast city neighborhood. I took a fancy to a small boy at school, who possessed the requisite delicacy, timidity, and sweetness, if not the physical requisites, of my beau ideal. I walked with him in the park and planned to have him at the house; but the matter was not arranged. At boarding-school I had associated much with younger and weaker boys, and had been ridiculed much for my

cowardice in sports, but at the city school I moved with my equals and won their recognition. Our gymnasium director was middle-aged and of an indolent disposition. He liked to recall his youthful erections and to answer my sexual queries too fully, and cheerfully volunteered information on brothels. Yet I doubt whether he had an evil purpose in conversing with me. I thought I should never dare or want to enter one. I always conjured up the picture of a row of naked women from whom I could take my pick, and the smell of the women I imagined to be identical with the smell of my big friend A. at boarding-school. When I was traveling down town on an elevated train one afternoon the brakeman asked me whether I had ever been in a brothel, and told me that disorderly houses abounded in my neighborhood. "I have had connection with women," said this red-haired young man, waving his hand in greeting to a woman who nodded at him from a window, "since I was 15 years old. Not long ago a fine-looking, young woman in black offered to pay all my expenses if I would live with her and connect with her."

When a girl of perhaps 7, a distant cousin of mine, visited us for a few days, I gratified my lust by placing my hand under her genitals and swinging her to and fro. She giggled with pleasure. That summer I began to experience the evil effects of the masturbation which I had practiced daily for a year and a half. Pimples began to break out on my chin (my complexion up to this time had been white and delicate). The family ascribed my condition to digestive difficulties. In playing with the boys and girls I found myself seized with a terrible shyness and a tendency to look down and weep. I had lost all the courage I had--it had never been great--in the presence of a crowd of children. I was fairly at ease with a single companion. My self-consciousness was something more painful to me than I can convey in words. At home I wept in my room and cursed myself for a baby. I little realized the cause of my nervous collapse. Yet I had too robust a frame not to be able to sleep and to play hard. The sympathetic pleasure which I had found in swinging my girl-cousin to and fro I now doubled by letting a 7-year-old boy ride cock-horse on my feet. I experienced an erection during the process, and I almost induced ejaculation when I tickled the boy with my feet in the region of his genitals. To see his shrinking, giggling joy gave me an exquisite sexual thrill. I longed to sleep with the boy, but I was afraid of causing comment. At the

new and large boarding school which I entered in the fall my most lustful dreams and ejaculations were concerned with standing this little boy on the footboard of a bed, taking down his knickerbockers, and performing fellatio on him. But I dreamed also of natural coitus. I fell in love with the handsome, 12-year-old son of the aged headmaster. The boy, O., sat next me at the table, and I never tired of gazing at him. It gave me a special sense of pleasure to look at him when he wore a certain flowing, scarlet, four-in-hand necktie. But O. was not attracted to me--for one thing I was in a disagreeably pimped condition--and I could not induce him to linger in my room nor to sleep with me. My passion for O. did not diminish, and it rose to its supremacy on the evening when he appeared in our hallway (he roomed on the girls' side of the house and hinted at the sexual sights that he saw) in a costume of white satin, lace, and wings. He was ready for a costume party.

I now masturbated less frequently, for I was beginning to appreciate the horrible consequences of my indulgence. I had frequent pollutions, with dreams. My day was one long agony of fear. How I dreaded to go to sleep in the same bed with my older chum, who never made any advances beyond embracing me passively cum erectione while he was asleep. My day was one long agony of fear. At meal time my feet constantly writhed in agony for fear that the headmaster's grown up young ladies should make fun of me, or that my lack of facial composure and my inability to look people in the eye might be commented upon. I tingled with apprehension, especially in the region of my stomach. Every nerve was taut in the effort I made to appear composed. I masturbated with erections over nothing. Greek recitations were for me an auto da fe. My heart beat like a trip-hammer at the thought of getting up to recite, and once on my feet my voice shook and my mind wandered. I hated the thought of people behind me looking at me. I rarely summoned the courage to turn my head either one way or the other. I vastly admired the "bravery" of the small, 15-year-old boy who recited so calmly and so well. I was too cowardly to play foot-ball and base-ball, and I dreaded even my favorite tennis because the spectators put me in a state of scared self-consciousness. Knowing my own condition, I was yet so blind to it most of the time, and such a Jekyll-and-Hyde, that I actually pitied a boy of 19 who was an eccentric and a scared victim of masturbation. But in spite of my neuropathic condition

I developed intellectually. I do not touch upon this aspect of my life, however, because I am trying to limit myself strictly to sexual manifestations. At the present time I have not the courage to continue the narrative.

HISTORY III.--The following narrative is written by a clergyman, age 40, unmarried:--

My childhood and early boyhood were unmarked by sexual phenomena, beyond occasional erections, which commenced when about 5 years of age, without any exciting causes. These were accompanied by some degree of excitement, of the same nature as that which I experienced in later years. I was absolutely ignorant of sexual matters, but always had an idea that the essential difference between man and woman was to be found in the genital organs. This was sometimes a matter for thought and curiosity.

Being for many years an only child I saw little of other children, and formed the habit of amusing myself with making things--boats, houses, etc.--and acquired a taste for science. When I could read I preferred biography, history, and poetry to anything else.

When I was 13 years old and at a large school I heard for the first time of coitus, but very imperfectly. For a few days it filled my thoughts and mind, but feeling it was too engrossing a subject and one which took me off better things, I put it out of my mind. Later, another boy gave me a fuller description of the matter, and I began to have a great desire to know more and to be old enough to practice it. I also discovered that boys masturbated, and about a year after tried the experiment for myself. This vice was largely indulged in by my school-fellows. It never occurred to me that it was sinful, until I was nearly 16, when I came across a passage in Kenns's Manual of Schoolboys, in which it was hinted such things were wrong morally and spiritually. Previously I had felt it was an indelicate and shameful thing, and bad for health. This last idea was held as a solemn fact by all my boy friends. Gradually religion began to exert an influence over my sexual nature, obtaining as years passed a greater and greater restraining power. It is simply impossible for me to write a history of my

sexual development without also describing the action which Christianity has had in determining its growth. The two have been so intimately bound together that my life history would not be a faithful record of facts if I left religion out of it.

At school I took part, with great keenness, in cricket and foot-ball, and was very ambitious to excel in everything in which I took an interest, but I always had other tastes as well, which were more precious to me, for example, the love for science, history, and poetry. Until I was past 16 years my desire was simply for coitus, girls and women attracted me only as affording the means of gratifying this desire; but when I was nearly 17 I began to regard girls as beautiful objects, apart from this, and to desire their love and companionship. At the same time it dawned upon me that life held much of joy in the love of women and in domestic life--so henceforth I regarded them in a higher and purer light, and apart from sexual gratification. In fact, from this period till I was over 20, this idea so dominated my whole being that the lower side of my nature was entirely held in subjection and abeyance by it. It was rather repulsive to think of girls as objects of lust. This state of mind was not brought about by any romantic attachment or through any acquaintance or through circumstances. I was living in great seclusion and had no girl friends. After this period the lower side of my nature woke up as a giant refreshed with wine, and I underwent for many years a constant struggle with my nature, in which religion always triumphed in the end. I never fell into fornication, though sometimes into the vice of masturbation. These outbursts of desire were periodic, about ten or fourteen days apart, and would last several days. I must record also the fact that from the time this awakening took place my ideal views of woman no longer seemed incompatible with sexual relations. I noticed that at about 27 there was a lessening of the desire, but that may have been due to overwork and consequent nervous exhaustion. I had a good deal of worry and studied daily for about eight hours. In any case the impulse was strongest during the years above mentioned. A little later in life, for a time, I became attached to a girl, and eventually engaged. I then observed, greatly to my sorrow and annoyance, that whenever I met this lady, or even thought of her, erections took place. This was particularly painful to me, as my thoughts were not of a lustful or impure character. Sometimes sitting by her at a religious service this

would occur, when certainly my mind was far away from anything of the kind. That was the first woman ever kissed by me, except of course members of my immediate family circle. Later on my thoughts turned to marriage, and there was a great longing at times for this event to take place. However, as this attachment afterward became the great sorrow of my life for years, it needs no more comment. This closes one chapter of my history, and at present I do not propose to add another, as in a great measure it is only partly written. It may be well here to state that there has never been in me the slightest homosexual desire; in fact it has always appeared as a thing utterly inconceivable and disgustingly loathsome. I am fond of the society of both men and women, but on the whole prefer the latter. I have had several warm and intimate though platonic friendships, and get on exceedingly well with the other sex, although not a good-looking man. I have always been attracted to women by their spiritual or mental qualities, rather than by physical beauty, and feel strongly that the latter alone would never cause me to desire coitus. Unless there was an attraction other than that of the flesh, I should feel that I was following simply a brute instinct, and it would jar with my higher nature and cause revulsion. This was not the case in my earlier years to the same extent. I have often wondered whether the sexual impulse was strong in me or not, but if not, there is nothing in my physical state or family history to account for it. I am fairly cognizant with the lives of my ancestors, being descended from two old families. The sexual instinct was certainly not weak or abnormal in them. Personally, I am tall and healthy, well built, but sensitive and highly strung. Smell has never played any part in my life as a stimulant of sexual desire, and the mere thought of body odors would have a very decided effect in the opposite direction. Touch and sight appeal to me strongly, and of the two the former most.

I am convinced, after many years careful thought, that sexual vice and perversion could be greatly reduced if the young were instructed in the elements of physiology as they bear on this question. Personally, had I been thus enlightened much sin would have been avoided in my schoolboy days, and a perverted view of sexual matters would never have arisen in my mind. It took years to overcome the feeling that all such things were unclean and defiling. Eventually light came to me through reading a passage

in a tractate on the Creed by Rufinus. He was defending the doctrine, of the Incarnation against the pagan objection that it was an unclean and disgusting idea that God should enter the world through the womb of the Blessed Virgin Mary, and he meets it by showing that God created the sexual organs, therefore the objection is invalid--otherwise God would not be clean or pure, having Himself designed them and their functions. This passage is slight in itself, but gave birth to a line of thought which has influenced me profoundly. I no longer regard sexual matters as disgusting and unholy, but as intensely sacred, being the outcome of the Divine Mind. Further, the Incarnation of the Saviour has not only sanctioned motherhood and all that is implied by it, but has eternally sanctified it as the means chosen for the manifestation of God to the world. I should not obtrude my theological conceptions, but for the fact that they have determined my life-history in that aspect.

HISTORY IV.--When I was 9 years old a boy at the preparatory school, which I attended, showed me the act of masturbation, which he said he had practiced for a long time, and which he urged me to imitate, if I wished to become a father when I grew up, and married! Boy-like I believed him and tried, but the sensation obtained was not a pleasant one (I suppose that I was too rough with myself) and I desisted.

When I was about 12 years old, a schoolfellow told me that he had seen his nurse copulating with the groom, and he and I used to haunt the woods in the hope that we might see an amorous couple so engaged, but without success. We often talked of the act, as to how it was done. Neither he nor I had any clear ideas on the subject, save as to the organs involved. I was about 15 when a maidservant of the house in which I was a boarder, came to my bedroom one night and taught me how to masturbate her. She said that this was a good thing for me to do, and warned me never to "play with myself" as it would kill me, or drive me mad. I told her that I had tried it, but could not bring on a pleasurable feeling, so she did it to me, and although I did not have an emission, I derived great pleasure from the act. She told me that it never did a boy any harm to let a girl play with his parts, and promised that if I would keep the secret, she would often do this for me. Naturally I promised to say nothing, and she often

came up to my room. Later on she used to insert my penis into her vulva, while she was rubbing it, at the same time giving me a pigeon kiss. This _modus operandi_ was much appreciated by me. One night, after we had been together thus, I dreamt of her and her maneuvers and had my first emission. I was very proud of this, as I considered that I had at last attained to man's estate, and told her of it. She never allowed me to insert my penis into her vulva after that, alleging that she did not want to have a baby.

I was about 16 $\frac{1}{2}$ years old when I had my first real coitus, my partner in the act being a girl some two years older than I, who lived near us. I enjoyed the act very much, as she permitted, nay insisted on, emission _intra vaginam_, and told her that this was much nicer than my amours with the maidservant which of course I had confided to her. She laughed, and said: "Of course." We often copulated, as long as I was at home, and then I lost sight of her. Of all the women with whom I have had to do, save one, she had the most copious secretion of mucus, which in those days I believed was the woman's semen. Her thighs used to be wet with it.

At the University I had regular relations with women of all sorts, rarely missing a week. Two of them were married women, one the wife of a solicitor, the other of a doctor. How proud I felt of my first intrigue with a married woman! I felt that I was really a man of the world now!

But though my friends used to tell me all about their love affairs, and I longed to confide in them, I did not do so. This was because when I went up to the University, my uncle said that he would give me a word of advice and hoped that I would follow it--never to give away a woman, and never to refuse to respond to a woman's advances, whoever she were. To neglect this advice would, he said, be foolish, and to break the rules "damned ungentlemanly." I wish I had always followed advice proffered, as closely as I have followed this. One night, when I was somewhat disguised in liquor, as our grandfathers would have put it, I picked up a girl, who was a private prostitute, if the phrase be permissible. She declined copulation, and proposed other means of satisfaction. I insisted, being stubborn in my cups. Had I been sober I should have done as she suggested, for I have always made

it a point to allow the woman to choose the method of gratification, and not to demand, or even suggest, anything myself. I like to please women, and I have always been curious as to their wants and desires, as revealed, without outside influence, by themselves. The result of my refusing all methods of gratification save the most ordinary was that the girl, who must have known that she was not all right, but shrank from saying so in so many words, gave me a gonorrhoea, which lasted nine weeks and much interfered with my amours, as I naturally declined to run the risk of infecting my partner, a risk which to my certain knowledge many a young fellow has run, with disastrous consequence to the confiding woman. As it was due to my tipsy obstinacy, I could not blame the girl, but resolved never to drink too much again, a resolve which I have kept, save once, unbroken. In those days we youngsters thought that it was manly to be able to carry one's liquor well, and did all in our power to attain to the seasoned head; but I considered that the risks entailed were too serious to be neglected.

I was well on in my 26th year when I met a widow with whom I fell in love, with the result that I married her. She is a most sensible woman, and it was her intellectual gifts which were the attraction to me. In my amours intellect has never played a part. She has all along been cognizant of, and lenient to, my polygamous tendencies; for she recognizes the fact that whatever _fredaine_ I may have on hand makes not the slightest difference in my love and respect for her. Were she a more sensual woman, perhaps things would be different.

In all I have had to do with 81 other women, of whose special characteristics I kept a careful note at the time. Twenty-six were normal women with whom my _liasons_ have lasted long, so I know more about them than I do about the other fifty-five, who were prostitutes, and with some of whom my dealings were but for an afternoon.

The races represented have been these, for I have seen a bit of the world: English, Scotch, Irish, Welsh, French, German, Italian, Greek, Danish, Hungarian, Roumanian, Indian, and Japanese. Taking them all round, the only difference that I found between old and young women is that the older ones are less selfish, and more complaisant, and less inclined to resent one's

being unable to attain to the height of their desire, for from time to time I have been unable to "come up to the scratch" after a heavy night's labor, or when I was afraid of being caught in the act of coition, a fear which, in my experience, acts as a stimulus to desire in women, unlike its action in men. Of all the women with whom I have had to do the nicest in every way have been the French women. The English women of the town drink too much, and are far too keen on getting as much money as they can for as little as they can, to please me. Were the London girls to recognize that men do not like a tipsy woman, and that where there is so much competition the person who is most skillful and most polite gets the most custom, the alien invasion in Regent street would soon come to an end.

Of the fifty-five prostitutes: eighteen informed me that they were in the habit of masturbating; eight of their own free will, without asking for reward, did _fellatio_; six asked me to do _cunnilingus_, which I naturally declined to do; three proposed anal coitus. Of those who did _fellatio_, two (one French and one German) told me that they had taken to it because they had heard that human semen was an excellent remedy against consumption, which disease had carried off some of their relatives, and that they had gradually come to like doing it. All who told me that they masturbated, asked me whether I did so too, and two desired me to show them the act, one alleging that she liked to see a man do it; she had been married late in life, after a "stormy youth" and had had, she said, a large experience of the male sex. They all seemed to think that however much the practice of self-excitement might hurt a man, and all thought that it would hurt him, a woman might masturbate as often as she liked, failing better means of satisfaction, as she had no such loss of substance as a man.

Of the twenty-six normal women, whom I knew more intimately than I did the fifty-five prostitutes, thirteen, without being questioned by me, blurted out the fact that they were habitual masturbators, apparently all required to think of the loved person to obtain full satisfaction. _Fellatio_ was proposed, and fully performed, by nine, of whom three experienced the orgasm as soon as they perceived that I had attained to it. All were more or less excited while doing it. One proposed anal coitus, "just to see what it was like;" and three proposed _cunnilingus_, one

having been initiated by a girl friend, and one by her husband. The third had, I believe, evolved the act out of her own inner consciousness in her desire to experience pleasure with me. My relations with one of the twenty-six were confined to my masturbation of her, the while she did _fellatio_, as she said that she "had no feeling inside down there."

With two exceptions my partings from these normal women have not been tragic and all whom I have met in after life (seven) have been very ready to resume relations with me, four of them having made the proposal themselves.

One thing has struck me, and that is the, often great, difference that exists between what a woman's looks lead one to think she is, and what she is when one becomes her lover; the most sensual woman that I have met might have sat for her portrait as the Madonna, and she was the only one who took pleasure in hearing and relating "smoking-room stories," a form of amusement which, perhaps from their want of appreciation of humor and wit, women do not indulge in--at least in my experience.

HISTORY V.--(A continuation of History III in Appendix B to the previous volume.)

As I became better I commenced to dream of true love. I wondered, too, if my horrible past really could be lived down and a young woman come to love _me_. I took pleasure in reading love poems, especially Browning's, and illustrated some with little water-colors....

I was sitting in the stalls one night seeing a performance by a company of English actors when one of them played so badly that I thought to myself: "Why, hang it, I could play it better myself!" The next minute another thought followed: "Why not try?" I came out of the stalls the proverbial stage-struck youth. I was sitting in the same place another night when the young man next to me entered into conversation. By a strange coincidence he knew a few young men, amateurs, who were going to form a company, give up their situations and travel, if they could induce a few more to join them and put a little money in. I made an appointment for the following evening....

There were lots of meetings in bedrooms and rehearsals between the beds, but ultimately I was told a school-room had been engaged and a professional actress, A.F. I went to the school-room and found all the boys there, and a young woman with a pale, rice-powder complexion. On introduction she gazed at me as if struck dumb. If she had been better-looking (I thought her vulgar and puffy) I would have been flattered. I was disappointed, but rather frightened (she had a stage presence) of her professional ability, especially when we commenced to rehearse. I had to make love to her, too, which embarrassed me. She had a good profile, I noticed, and would have been better looking, I thought, if she were in better condition, for she was young, about my own age, twenty-three or four. We were all young--enjoyed our rehearsals, and had lots of fun--but I did not respond to the advances A. was evidently making to me. Finally we started on our tour. As the weeks went on A.F., like the others, improved wonderfully in health and appearance. If we had had anything like houses it would have been a pleasant trip. My strangeness did not escape the notice of the boys altogether, for I was still a bit strange in mind and nerves--and deeply religious, bowing my head before each meal and reading my little Bible and prayer-book at odd times. I drank no alcohol. I spent a good deal of time by myself or with my faithful companion A., who was nearly always at my side, she and her appealing eyes. I was surprised to see how quickly she had improved; she looked quite attractive and ladylike some evenings at meals, but I only tolerated her. I was selfish and conceited.

Things had been going on like this for a week--always playing to empty houses and our money lower and lower--when A. said to our other lady, Mrs. T., on a train in my presence: "I shall have to give him up, I suppose; he will have nothing to do with me." Mrs. T. said: "You give him up, do you?" and looked at me as if she were going to try her hand. A. said "Yes," and looked at me, smiling sadly. I don't know what motive prompted me--whether my vanity was alarmed at her threatened desertion or that she had really made some impression on me by her love, probably a little of both--but I said: "No, don't; come and sit down here," making way for her, and she joyfully came and nestled against me. From that time I ceased to treat her with ridicule, and kissed her at other times than when on the stage. I was subject still to black

moods, and would not speak to her for hours sometimes, but she seemed content to walk with me and was infinitely patient. I had heard she was living with--if not married to--an actor. I asked her about him once, and she said she did not love him; she loved me and had never loved before. Her face had a touching sadness; her life had been unhappy and stormy, with no love and little rest in it. Her face, when she had lost her dissipated look and unhealthy pallor, was exquisite, delicate as a cameo. Love had improved her manners, too; she was more gentle and refined. I let things drift without thinking of the future, when one night after the performance--I was lying on the sofa and A. was sitting at my side, as usual--I suddenly thought, with the brutality that characterized me in these matters--"I will ask her to let me sleep with her." I still fought against any premonitory thought of self-abuse, but here, I thought to myself, is a chance of something better that will do me no harm and perhaps good. When she understood me she turned very red and walked away, shaking her head. But I let her understand that was the only way of retaining me, and finally, when they had all gone to bed, she gave herself to me, reluctantly and sadly; for she, too, had been drifting on without thinking of anything of this sort (she hated it at this time), but just living for her love of me, her first true love.

Before this occurred, I must tell you, I had been so much better that I sometimes felt capable of doing anything, a sense of power and grasp of intellect which was combined with delicacy of feeling and sensitiveness to beauty, to skies and clouds and flowers. I seemed to be awakening to true manhood, to my true self. And at meals, it is worth recording, I commenced to have a distaste for meat.

These glimpses of a better state of things left me on cohabiting with A., and for a time my gloom and black religious mania came on me once more. I now thought of my promise at confirmation, and it seemed to me I had offended beyond pardon. When we came to the next town, however, I openly slept with A. all night, leaving my own bed untouched. When we returned to Adelaide one of our party remarked: "The only man who had any success with the women on the tour was a Bible-reading, praying, and good, pious, confirmed Christian."

A.'s nascent beauty and delicacy and improvement were gradually impaired, too. My own conduct became so morose at times that, besides increasing her misery, I offended the others, and bickerings ensued. I heard the other actress say "He's mad; that what's the matter." And I was so wrapped up in myself and my religious mania that I did not mind their thinking so.

After the tour was over A. asked me to come and see her at her home, and as I missed her very much I went one night to tea. She had a room in her father's house to herself. A. was dressed in her best and we had an affectionate meeting. After tea I asked her if she were married to E. She said "No." Then I said: "Who are you married to?" She commenced to cry then, and told me something of her life, the saddest I ever heard. When only 17 she had been courted by a young man she did not care for, but who prevailed on her parents by pretending he had seduced her, but wished to marry her. Strange as it may seem, A. did not know what marriage meant, her mother being one of those silly women who don't like talking of these things and let their daughters grow up in ignorance, expecting they will learn from some one. In nine cases out of ten this happens, but A. was an exception. It was this, and the fact that she had not a particle of love for her husband, that gave her such a hatred of coition. When her mother saw the sheets the morning after the marriage she burst out crying; she did not like the young man and saw she had been deceived.

A.'s husband soon showed his true character; he was in reality a gaol-bird. He beat her, drank, and even wanted her to go on the streets to earn money for him. She left him and went home; it was then she began her theatrical career by entering the ballet. At intervals her husband, drunk and desperate, would waylay and threaten her in the street. One day after a rehearsal he attempted to stab her. She got on in spite of all, being a born actress, and played small parts in traveling companies. Then E., who had also gone on the stage, courted her and she listened to him, not because she cared for him, but he protected her and offered her a home. She joined him; but his drunkenness and sensuality were so gross that he ruined his health and he attempted to maltreat A. in a nameless way. And whenever she was in the family way he would leave her alone and half-conscious in the cellar for days. To add to her misery she had epileptic fits.

Then sometimes they would be out of an engagement and starving. They had been so hungry as to steal raw potatoes out of a sack and eat them thus, having no fire. She would often have had engagements, but E. was jealous and would not let her act without him. And he beat her as her husband had done, and her health became undermined. It was just after one of the forced miscarriages that she joined our traveling company, and that accounted for her yellow and puffy appearance. E. was now away up-country with a circus, but was expected down any time. A. told me a good deal of all this, between her tears, while sitting at my feet, and her tone carried conviction. When I ought to have gone home I persuaded her to let me stay all night. We had been in bed some time when her mother knocked at the door and wanted to come in for something in a chest of drawers there. "Why don't you open the door, A.? Who have you got there? Hasn't that fellow gone?" A. was confused and told me to get under the bed, but I refused, and she covered me up with the bed clothes as well as she could and opened the door. She had hid my clothes, but missed one of my shoes, and her mother saw it. "Oh, A.," was all she said; "you've got that fellow in bed," and went out crying. "Well, Fred" (my stage name), "you've got me into a nice row," A. said. She gave me my breakfast in the morning and I walked out of the front door without being molested. Another night I entered her window by a ladder and stayed all night. In the middle of the night E. came home drunk. She would not let him in and told him she would have nothing more to do with him. He attempted to break in the door, when A. called to me, and hearing a man in the room he went away, saying, as he went downstairs: "Oh, A.! Oh, A.!" as if he thought she would not have done such a thing. He never molested us after that night.

I think it was my intention, at first, to break off with A. gradually. I found, however, I could not keep away from her, and it commenced to be evident to me that a bachelor's life in lodgings again would be dreary and lonely. And all this time the fear that I had offended God troubled me more than I have said, and it occurred to me (there may have been a touch of sophistry in this, or not) that if I were a true husband to her for the future--stuck to her and worked for her for the rest of my days--perhaps it would find favor in God's sight and be an atonement for my sin. Had she been free I would have married her, I believe. But she began to be harassed by her mother and

bothered about my incessantly coming there and staying all night. It ended in my telling her I would be a husband to her, and she came and lived with me at my lodgings. We had one room and our meals cost us sixpence each. Cheap as it was, it was a struggle for me to earn money at all. I remember feeling ill and anxious once, and sustaining myself by the thought of my father wheeling the heavy truck up the street when he married my mother. And I decided to wheel my truck, too.

A. seemed happy and her love increased, if possible; at first, though, she must have found me a trying lover, for I made her kneel and pray with me two or three times a day, which she did with such a queer expression of face. Sometimes her feelings got the better of her, and she would say: "Oh, damn it, Fred, you are always praying." And then I would be shocked and she would be sorry.... Coitus was frequent; she commenced to like it now....

A. was not looking well one evening when she came in, and lay down on the bed. Presently she commenced to make a strange noise, and I saw her eyes were closed and her hands clenched. "Ah," said the landlady, who came in to help me; "she has epileptic fits." When her convulsions were over she looked blankly at us, knitting her brows and evidently puzzling her poor brain to remember who we were. For many years it was my fate to see her looking at me thus, at first stony and estranged, like a dweller in another star, then half-recalling with extended hand, then forgetting again with hand to mouth, then the gradual dawn of memory and love, and final full recognition. "It's Fred, my Fred!" I never got used to it; it always moved me to tears.... It was not to be thought that we had no quarrels. I still had fits of bad temper, and sometimes they came into collision with A.'s temper. It hurt my vanity considerably to see how soon she relinquished the respectful, patient, spaniel-bearing she had when we were traveling. I said some cruel things to her and she retorted. One would have thought, to hear us, that all affection was over. But when the mood of rage wore itself out we would both be sorry and make it up with tears, and be very happy in spite of our poverty.

I think it was lust that prevented me from striving to fulfill my ambitions. A. let me do anything I liked, at all times of day or night, although she seemed surprised at my proceedings sometimes, for it was becoming a fever of lubricity with me. She still

thought only of her love. I remember her coming in one day, tired, pale, perspiring, and worried--we had hardly anything in the house and she had been to the theater ineffectually--and when her eyes lighted on me the whole expression of her face changed, softened and brightened at once, and she came and kissed me and said: "It is so strange, I was thinking all sorts of nasty things coming along, but as soon as I see my pet's face I feel happy--I don't care for anything--I would sooner share a crust with him than have all the money in the world!"

I commenced to feel libidinous curiosity to examine her--this was mostly on Sundays--and she let me, blushing at first, but laughing. Then I would try new positions in coitus I had heard of. Still she did not enter into my mood.

She was engaged at this time to play in a pantomime and I commenced to lead a miserable, jealous existence. I heard scandal about her, baseless enough, but in the diseased, nervous, anxious state I had brought myself to it nearly drove me mad. I would go with her sometimes to visit her mother, whom I began to like. Her brother I still saluted coldly. It caused me horror and jealousy to see A. kissing him and letting him tickle her. In my rage, when we came home, I even said that perhaps she would let him do something else, naming it brutally and coarsely. I remember her shame, astonishment, indignation and tears. If ever a man tried a woman's love I did. But she forgave me, even that.

We went to live in a little cottage. It was in this cottage that A. first showed signs of lust, and in the diseased state of my mind, instead of regretting it, I encouraged her. She told me one day that the orgasm very often did not occur at the same time with her as with me, and that it would not unless I put my little finger into the anus. This her husband taught her, and she would rather have died than confess it to me when we first met. We would often devote our Sundays to having a picnic as we termed our lustful bouts, stimulating ourselves with wine. Her temper was not improved thereby (though her fits entirely stopped for a twelvemonth)--we had wordy warfares, but we made it up again always with tears. Nor did I allow myself to deteriorate without reactions and excursions into better things. I was always reading Emerson; it was he who rescued me from orthodox Christianity and taught me to trust in myself and in Nature. I have never ceased

this struggle towards better things to this day. There, in a nutshell, is my life; I have always been defeated when temptation came, but I have never ceased to struggle. I determined to be more abstemious in sexual indulgence and asked her to help me. She agreed willingly, for she was easily led. Whenever we fell back again into excess it was my fault.

At a theatrical performance we first met a Miss T., a young German who sang. She was about 25, with modest, quiet and engaging manners. A. and she became very friendly. I liked her; she was tall, dark and lithe, but had bad teeth.

I had been ill and at this time A. and I had a quarrel, my temper suddenly breaking out in murderous frenzy. I called her names and finally put her outside the house, telling her to go to her mother. I suffered a very hell of remorse and misery. Everything in the quiet, lonely house reminded me of her, seemed fragrant of her; my anguish became so keen I could not stop in the house, though I was just as wretched walking about. I kept this up for two days, when I met her coming to look for me. One look was enough--"A.!" "Pet!" in broken sobs--and in tears we kissed and made it up. Miss T. was with her, and I greeted her, too, with happy tears in my eyes. Another time, when A. was giving way to her temper, and one would have thought all love was dead, I said "Don't you love me then?" and the word alone was a talisman, her face changed, she held out her arms and began to sob quietly.... She accepted an offer to travel with a small theatrical company who were going up-country. She was not looking well when I left and after a time I received a telegram telling me to come to her at once as she was ill. Dreading all sorts of things I borrowed my fare and went to her. I knew nothing of women, of their point of view and different code of honor, and was very far from the attitude of Guy de Maupassant who said he liked women all the better for their charmingly deceitful ways. A. wanted to see me and had taken the surest means to ensure my coming. I was angry at first, but she looked so well and was so loving that I could not be angry long.

One day when I was working the landlady came in and began talking about A. and her conduct before I came. She had gone into the actors' rooms at all hours, the woman said, and drank and been as bad as the rest in her conversation. It was the second time a

married woman had run her down to me, and I commenced to think there might be something in it, and suffered all my mad jealousy over again. Not knowing the freedom actors and actresses allow themselves on tour, without there being necessarily anything in it, I worried till I thought I had nothing to do but die. And then one of the great struggles of my life occurred. Walking the country roads, I asked myself: "If it is true, if she has been unfaithful, will you forgive her and help her to arrive at her best?" For a long time the answer was "No!" But perhaps my striving for unity with myself had done some good, and the final resolution was for forgiveness. I felt more peace of mind then, and when I told a dying consumptive lodger in the house what the landlady had said, he replied, "Don't you believe a word of it. I know she loves you!"....

After an absence I found myself one evening in a town where A. was performing. I went round to the back and they told me she had gone to a room in the hotel to change for another part. I followed and entered the room, with a glass of spirits I found that an effeminate young actor was bringing to her. She was half undressed, her beautiful arms and shoulders bare. My arrival was unexpected and she looked at me surprised, I thought coldly, as I reproached her for not keeping a promise she had made to me to touch no alcohol during the tour, but soon her arms were round my neck. She cried like a child. She was bigger and handsomer and healthier. There was not only an increased strength and size, but an increased delicacy and sweetness; her eyes and brows were lovely; there was an indescribable bloom and fragrance on her, such as the sun leaves on a peach; the traveling, country air, and freedom from coitus (had I known it) had enabled her to arrive at her true self, not only a beautiful woman, but a woman of fascination, of wit, vivacity and universal camaraderie. Her face was like the dawn; all my fears and jealousy left me like a cloud that melts before the sun. I remember the look on her face as she embraced me in bed that night. It had just the very smallest touch of sensuality, but was more like some beautiful child's who is being caressed by one she loves; this divine, drowsy-eyed, adorable look I had never seen on her face before--nor have I since.

We fell back into our old lustful ways. Later on A. became ill and the black devil of epilepsy returned. I became gloomy.... A

restlessness and selfish brutality came over me; our love and peace were gone. I persuaded A. to go to Melbourne and look out for an engagement. The day before she was to sail we went to Glenelg for a trip. The sea air, as often happened, precipitated A.'s fits. We had gone down to the pier and A. said she felt bad. I just managed to support her to the hotel before she became stiff, and I made some impatient remark (for she nearly dragged me down) which she heard, not being quite unconscious and said half incoherently and very pitiably: "Be kind, oh, be kind!" repeating it after consciousness left her. Her heart had been breaking all day at the prospect of parting, and also, I expect, because I was so ready to part with her. That moment was a crisis in my life. I was in a murderous humor, but she looked so unutterably wretched that it seemed impossible to be anything but kind. I made myself speak lovingly to her, in moments of partial consciousness, hired a room, carried her up, and nursed her and petted her all night. The act of self-control, and forcing myself to be kind whatever I felt, became a habit in time, a sort of second nature.

In a few days she sailed. When she had gone I was remorseful and mad with myself. How could I let her go by herself? I resolved to follow her as speedily as possible, and did so.

If I remember rightly I came to the conclusion about this time that we ought not to have coition unless we felt great love for each other. It seemed to corroborate this to a certain extent that A. always seemed more electric and pleasant to the touch when we had connection for love and not for lust. Leave it to Nature, I would say to myself. I began to feel how much my struggles, efforts and temperate living had improved me. I had more self-respect, though something of the old self-consciousness was still left. I did not get better continuously, but in an up-and-down zigzag. I still had moods of rage approaching madness and periods of neurotic depression. Long walks decidedly helped to cure me, and the sea, sun, wind, clouds and trees colored my dreams at night very sweetly. I frequently dreamed I was walking in orchards or forests, and a deeper, slightly melancholy but potent savor, as of a diviner destiny, was on my soul.

After a long absence, during which she had frequently been ill, A. joined me. I could see she was recovering from fits, which I

began to realize that she had more frequently in absence from me, and also from drinking, perhaps. She was small and thin, but fresh and sweet as honey, and all signs of fits and tempers passed away from her face, so wonderful in its changes. I had become so healthy through my abstinence, temperance and long walks that our meeting was a new revelation to me of how delicate, fragrant and divine a convalescent woman may be. She was glad and surprised to see me looking so well, and if she put her hand on my arm I felt a joyous thrill. I was certainly a better man for abstaining and she a better woman and I determined not to have connection unless we were carried away by our love. As a matter of fact we did not give way to excess, though we were very loving. I tried to persuade myself that we had not gone back to our old ways, but I could not do so long.

Miss T. put in an appearance every day. She did not look so innocent, but as it was no business of mine I did not trouble. She seemed more attached to A. than ever.... A. was still very loving with me, but it was an effort to me to keep up to her pitch, and when A. proposed to go to Melbourne with Miss T, to sell off the furniture before settling in Adelaide, I was rather glad of the opportunity of abstaining from coitus and of watching myself to see if I again improved. When A. and Miss T. came to see me before going down to the steamer, A. was nearly crying and Miss T., changed from the old welcome friend, was not only pale and anxious, but looked guilty as if she had some treachery in her mind; she could not meet my eye. I thought less of it then than afterwards. And once more I took long walks at night and rose early to catch the freshness of the mornings.

Some time before this I had read a book advocating a vegetarian diet, and at this time I chanced to read Pater's beautiful "Denys L'Auxerrois," the imaginary portrait of a young vine-dresser, who was attractive beyond ordinary mortals and lived, until his fall and deterioration, on fruit and water. The words, "a natural simplicity in living" remained in my memory. I resolved to read more carefully the book on scientific diet. Who can say, I thought, what changes for the better may come to me if I live on a strictly scientific and natural diet?

I fasted one whole day, and then had a breakfast of cherries, in the middle of the day a meal of fruit, and walking in the

afternoon--a gray, rainy day--I felt so light, so different, and the gray sky looked so sweet and familiar, that I was reminded of the luminous visions of my boyhood. It was a distinct revelation. This Pan-like, almost Bacchic feeling, did not last, however, nor was I always able to maintain my new method of diet, though I tried to do so. I made the attempt, however, but I imagine I was more than usually run down. I would walk miles in the hope of feeling less restless. One holiday I walked down to Glenelg, having only had grapes for my dinner, and lying on the beach I looked through a strong binocular glass I had borrowed at the girls bathing. And the beauty of their faces in their frames of hair, of their arms, of their figures, seen through their wet clinging dresses, satisfied me and filled me with joy, gave me for a short time that peace and content--in harmony with the strong sunlight on the waves and the rhythmic surf on the shore--I was seeking. The summer evenings on the pier or along the beach had a peculiar savor; one felt the youth and beauty there even on dark nights, the air was fragrant with them, white dresses and summer hats disappearing down the beach or over the sand hills. It was easy--doubtless justifiable sometimes--to put a lewd construction on these disappearances; but I felt it need not have been so; that it was not necessary that youth and beauty, even the sexual act itself if led up to by love, should be a subject of giggling and sniggering. I always left the beach and its flitting summer dresses with a sigh.

A., after writing once, ceased writing at all and once more her mother and I were left in a state of anxiety and suspense. At last I determined to go to Melbourne to look for her, the only clue I had being a remark in her letter that a certain actor was giving her an engagement. In Melbourne I could not find any traces of her for some days and what traces I did find of her were not calculated to allay my anxious fears. One hotel-keeper told me that some one of A's name had stayed there with another hussy (giving Miss T's stage name): "There were nice carryings on with the pair of them." I thought of Miss T's strange looks, but could not imagine what hold she had on A., for A. loved me, I knew. I seemed to be in an inextricable maze. I could settle to nothing and was thinking of applying to the police when I heard that the actor A. had mentioned had taken his company to the Gippsland lakes. I followed to Sale, found the actor and was told that A. was not there. "She slipped me at the last moment," he

said, "and remained in Melbourne." I returned to my lodgings, with my anxiety and nervous restlessness increased tenfold. But suddenly my fear and restlessness left me like a cloud. I felt quiet, young, peaceful, able to enjoy the country, A. was doubtless all right and would be able to explain her silence. I undressed leisurely and happily, thinking of the stars.

The next day, Sunday, I awoke refreshed and still at peace. After breakfast, hearing children's voices, I went out into the garden and there was a collision of souls who somehow were affinities. A young girl about twelve or younger with a fine presence and handsome face fixed her eyes on me for half a minute and then came and sat on my knee. She was one of those children I am accustomed to call "love-children," because they are so much brighter, healthier, larger and more loving than others. I always imagine more love went to their making. We fell in love and she said, stroking my beard, "Oh, you are pretty!" and I said, "And so are you!" We were so affectionate that the servant called the child away and I went for a walk, finding my little sweetheart waiting for me on my return. The touch of her hand was electric and her voice fresh and musical. I kissed her, but had become more self-conscious since the morning and wondered if her mother or the servant were looking, or even if they would appear. I was not so frank and natural as my little chum. I have often thought of her since. She had the breadth of forehead, the strength and yet lightness of limb, together with the hands and feet, not too small, that I always imagine the dwellers in Paradise will have.

I returned to Melbourne and continued trying to find A. At the same time I commenced in earnest to live on fruit and brown bread only, and enjoyed better tone and health every day, so that it was a joy to walk down the street in the sun and exchange glances with passengers a la old Walt. One day in the Botanical Gardens veils seemed to be lifted off my eyes. I could look straight at the sun and taking my note of color from that golden light I turned my eyes on the flowers, the mown grass, the trees, and for the first time perceived what a heavenly color green is, what divine companions flowers are, and what a blue sky really means. For half an hour I was in Paradise, and to complete my joy Nature revealed to me a new and unexpected secret.

I was lying on a bench, basking, and my silk shirt coming open

the strong sun made its way to my breast and presently I felt a totally new sensation there. I had discovered the last joy of the skin. My skin, fed by healthy fruit-made blood, must have functioned normally under the excitation of the sun just then (for a brief space only, alas!). I cannot describe the joy, any more than I could describe the taste of a peach to one who has only eaten apples: it was satisfying, divine. I opened my shirt wider, but the feeling only spread faintly, and indeed this halcyon sunny hour terminated in a restlessness that sent me walking into town to look for A.

At last I heard, not of A., but of Miss T. She was in a ballet. I went round during rehearsal and while waiting entered into conversation with a little chorus girl with a good face, who was sewing. On my telling her whom I was seeking she stopped sewing and looked at me quickly: "Oh, are you her husband? I know her. _I have seen them together_." She looked as if she were going to tell me something, but merely shook her old-fashioned head in a mournful, indescribable way, saying "Why don't you keep your wife with you?" I went to the door and presently saw Miss T. She tried to avoid me, I thought, and looked more vicious than ever, but after a minute's thought reluctantly told me where she and A. were staying. To hide my fears and suspicions I had assumed a careless demeanor, but I think I should have strangled her had she refused to tell me. I hastily went to the place indicated and going up the stairs (to the astonishment of the people) opened the door and found myself face to face with A.--but how changed! She had the hard, harlot, loveless look I detested. I felt for a few minutes that I did not love her, and she regarded me coldly too, but presently old habits reinstated themselves. She put out her hands, very pitiably, and then was sobbing in my arms. I could get nothing out of her but sobs, and to this day do not know where she spent all these weeks nor why she did not write. Miss T. came in after rehearsal, pale and hard-faced. I greeted her politely, but was watching her, trying to puzzle out why A. did not look as she usually did after long absence from coition. Miss T. took another room in the same house and was soon joined by another ballet girl, young and very pretty, who soon began to have fits. A. was always crying until Miss T. went away with her pretty friend. I knew nothing, could hardly be said to suspect anything definite, and yet I pitied that pretty girl whose eyes looked so helpless and appealing.

I set to work again. But I continued to live on fruit and bread, and taking off my clothes I would stand up at the window in the sun. A lot of prostitutes, however, who lived at the back saw me and were scandalized or shocked or thought me mad. The landlady heard of it and spoke to A. So I had to desist from my glorious sun-baths.

We slept on a single bed, and though I did my best to avoid coitus (I wanted to wait and think out some theory of it), A., who knew nothing of this, wanted to resume our old habits, and finally I surrendered. But my sufferings next day were intense, and I had the sense of having fallen from some high estate. My thoughts were divided between two theories: one that our misery was caused by our diet, more or less; the other that we had fallen into some error as regards coitus, and this was becoming almost a certainty with me.

There is one incident I think worthy of note which happened before the "fall" just mentioned and when I was living on fruit and in splendid health. At a performance I saw a girl on the stage with handsome legs in tights, and once as she straightened her leg the knee-cap going into position gave me such a strange and keen joy--of that quality I call divine or musical--that I was like one suddenly awakened to the divinity and beauty of the female form. The joy was so keen and yet peaceful, familiar, and subjective that I could not help comparing it to a happy chemical change in the tissues of my own brain. Like the unexpected functioning of my skin in the sun it was a sign of a partial return to a normal condition, another glimpse of Paradise.

I stuck to my new diet and gained a fresh elation and joy in life. Gradually clothes became insupportable, and I went down to the beach as often as possible to take them off, and at nights, beside the patient and astonished A., I would lie naked. One evening, passing some grass, I looked over the fence like a gipsy and felt a longing to take off my clothes and sleep in the grass all night. It was of course impossible. And A. looked unhappily in my face; she began to think her mother, who now thought I was mad, must be right.

That night I woke up and found myself having coition. I was angry

and felt I had been put back in my progress, but a fever of lust now came over me. I would sit under the tap and let the cold water run over me to conquer the fever, but at the end of a week my hopes were frustrated and I even turned against my natural diet, on which I had made flesh. A., as I expected, went through her usual fits, and slowly recovered. (If we had connection only once she in about three weeks had a mild attack of fits; if we had coition more than once the fits were more severe.) I relapsed more than once and as a means of impressing my resolution for future abstinence I would walk for miles in the middle of pitch-black nights....

Miss T. came over to Adelaide and as I knew nothing definite against her and heard that she was engaged, I thought perhaps my suspicions were unfounded and was friendly. But one day in town I saw her and A. on a tram going out to our cottage. Even then my suspicions might not have been awakened, but I saw Miss T. say something rapidly to A., and A. called out to me, "Will you be coming home soon?" And I answered "No." When the tram had gone on I found myself vaguely wondering what Miss T. wanted to know that for, for my perceptions were becoming acute enough to understand women's ways. In another minute I was walking rapidly home. When I came to the door it was locked. I knocked and knocked and no one came. I called out and threatened to kick in the door. Still no one came. Mad with rage I commenced to put my threat into execution, when the door was opened by Miss T., half-naked, in her petticoats, and pale as death, but no longer defiant. "So I've caught you, have I?" I looked, but could not trust myself to speak. Wondering why A. did not appear I went into the bedroom. She was lying on the bed, just as Miss T. had left her, on the verge of a fit, and on seeing me she held out her hands piteously, and when I stooped over her she whispered, "Send her away, send her away." Then she became unconscious and going into the next room I ordered Miss T. (who had managed to scramble on her dress) out of the house. I spoke scornfully as if addressing a dog, and she slinked out with a malignant but cowed look I hope never to see on a woman's face again. What they had been doing with their clothes off I do not know; women will rather die than confess. When A. had recovered from her fit she denied that there had been anything between them, and stuck to it doggedly, but with such a forlorn look I had not the heart to prosecute my inquiries.

For my part, all the efforts I had been making for so long seemed for a time to be in vain; for some weeks I sank into a sort of satyriasis, and even my anger against Miss T. turned to a prurient curiosity. At the same time I was not always able to adhere to my diet. But both as regards coition and diet I was still fighting, and on the whole successfully. My fits of temper, however, were excessive and my ennui became gloomy despair. One day I blasphemed on crossing the Park and spoke contemptuously of "God and his twopenny ha'penny revolving balls," referring to the planetary system. But for long walks I should have gone mad. A. was drinking in the intervals of her fits. I found half-empty bottles of wine hidden away. This did not improve my temper, and one day--this was when she was well and up--I struck her a heavy blow on the face, and she aimed a glass decanter at me. She went home to her mother and I lived alone in the cottage. I heard soon afterwards that her husband had come back and that they had made it up. Our parting was not, however, destined to be final.

Even out of that month's sufferings I made capital. I was better after my tendency to lubricity, my gloom, rage, restlessness and degradation. They had been but the irritations of convalescence.
